THE ELECTRICIAN

Estabd 1861. *The Oldest Weekly Illustrated Journal of*

Electrical gineering, Industry, Science and Finance

VOLUME CIII.

rom July 5, 1929, to December 27, 1929

[ALL RIGHTS RESERVED]

LONDON:

Printed by W. H. & SON LTD., The Arden Press, Stamford Street, S.E.1, and Published by BENN BROTHERS, LTD., at Bouverie House, 154, Fleet Street, London, E.C.4.

INDEX TO "THE ELECTRICIAN."—VOL. CIII.

SUB-HEADINGS IN GENERAL INDEX.

	PAGE
Exhibitions	ii
Institution of Electrical Engineers	iii
Legal Intelligence	iii
Obituary	iii
Parliamentary	iii
Reviews of Books	iv
Telegraphy	iv
Telephony	iv
Wireless Telegraphy and Telephony	iv
Works, Descriptions of	iv

Names of Authors of Articles and Papers are indexed alphabetically in the GENERAL INDEX, *and not under the sub-headings.*

General Alphabetical Index.

Heavy figures **denote that the subject matter is in the "Editorial Notes." When the letter (C) is placed after a title, it signifies that the article in question appeared in the Correspondence columns.**

A

Accounting, Systems, Electrical, 598
Accounts, Australian Electricity, 226
Advertising, and the Standard of Living [Benn], 221
Advertising by Supply Authorities [" Publicitas "] (C) 332
Advertising, E.D.A. **757**
Advertising, Technical [Simmons], 802
Advertising for Electrical Contractors [" Publicity Consultant "], 77, 194, 463; [Vignoles] (C) 500, (C) 602; [Thorpe] (C) 530
Advertising, Modern, 245
Advertising, Retail, is an Investment [" Sales Manager "], 331
Advertising, Supply Authorities and [" G. W. L."], (C) 142
Agriculture, Electricity in, 106 [Sams], 370
Alloys, New, 302
Alloys, Iron-Silicon-Carbon [Yensen], 556
Aluminium, Corrosion of, 676
Aluminium Facts and Figures, 428
Aluminium Standards, 161
Amateur, Menace of the [Moss], (C) 24
Ancient and Modern, **70**
Apple Cart, Electrical, **212**
Appliances, Domestic, in Canada, **44**
Appliances, Fittings and, Domestic, 86, 200, 471, 769
Architect, Electricity and the, **702**
Architecture, Power Station, **757**
Asbestos [Dunton and Muir], 663
Asbestos, Bakelised, Commercial Properties, 161
Ashridge House, Interesting Equipment at, **21**
Association of Supervising Electrical Engineers, Dinner of the, 640
Associations, Review of Work and Progress of Professional and Trade, in 1929, 815
ATKINSON, LL. B.: Progress in the Electric Cable Industry in 1929, 801
Australia's Policy, **628**
Automobile Electrical Association, Inauguration of, 575

B

Ball, Electrical Engineers', 700
Bankruptcy Report, **730**, 752
Baths, Electric, at Taunton, **157**
Batteries, Electric, in Canada, 140
Batteries, Storage, Developments in, During 1929 [De Grave], 794
Batteries, Storage, Manufacture of, 338
Battery Revolution, **239**
Battery Sales, 381
Battery? Where *is* that [" Battery Electric "] (C) 196, (C) 304, (C) 403, (C) 683; [" Cynicus "] (C) 276, (C) 360; [De Grave] (C) 432; [Durtnall] (C) 466, (C) 569; [Mitchell] (C) 248, (C) 530
Batti-Wallah's Society, Luncheon of the, 399, **590**, 738
Belgium, Electrical Penetration in, **2**
Belgium, Electrical Development in, **44**
BENN, SIR E.: Advertising and the Standard of Living, 221; Scandinavian Market, 595
Beryllium, Production and Uses of [Illig], **426**
BICKELL, S. F.: Progress in the Manufacture of Electric Cookers in 1929, 799
BISKEBORN, H. W.: Technical Progress in the Manufacture of Transformers, 787
Blackburn, Electrical Affairs at, **293**; [Sams] (C) 332
Bodleian Library, Lighting the, **350**, 825
Boiler House, Technical Progress of, during 1929 [Boles], 785
Boiling Plate of To-day [Howard] (C) 25
Book-keeping for Electrical Contractors [Withey], 597, 763
BOSTEL, A. C.: Showroom Organisation, 738
Bright-Annealing, Grünewald Method of, 675
British Electrical and Allied Industries Research Association, Financial Position of the, **2**, 25
British Electrical and Allied Manufacturers' Association's Annual Dinner, 680
BROWNLIE, DAVID: Scientific Developments in Steam-Driven Power Station Practice, 525, 828
BRUTY, A. G.: Mutual Responsibility of Contractors, Manufacturers and Supply Undertakings, 8
Budgetary Control and Sales Analysis, 736

C

Cable Conductor, Most Efficient Size of [Watson], 488
Cable Research, 827
Cable Unions, Aerial, 355
Cable Industry, Electric, Progress in [Atkinson], 801
Calculus, Groundwork of [Hunter], 220
CALFY, D. H. N.: Electricity and the "Tote," 71, 108
Campaign, Electric Homes, 303, 359, **391**
Canada, Electricity in, 539
Canvassing, Costly, **553**
Capital, Foreign, Germany and, 498
CARNEY, H. A.: Electric Water Heating in 1929, 798
CARR, L. H. A.: The Circle Diagram of the Induction Motor, 25
CASH, H. J.: (C) Our House in Order, 531
CASSIDY, JAMES: The Yallourn Electricity Scheme, 524
Central Electricity Board in 1929, 810
Charge, kVA., in A.C. Two-Part Tariffs [Clark], 131, **265**, 267
Charges, Reductions of, 258
Chart, Sag, for Copper Conductors [Taylor], 522
CHATTOCK, R. A.: Modern Use of Pulverised Fuel in Power Stations, 706
Chrome Plating, 672
Chromium, Electro-Deposited, 673
Chromium, Melting Point of, 673
Chromium Plating, 740
CHURCHER, B. G.: Properties of Sheet Magnetic Materials, 659
CHURCHER, B. A. G., and KING, A. J.: The Analysis and Measurement of the Noise Emitted by Machinery, 734
" Circle " Movement, **240**; [Sully] (C) 276; [Vignoles] (C) 276
Circuit-Breaking Problems, 643
Circuit Breaking, Researches in [Cooper] (C), 142
CLARK, E. V.: The K.V.A. Charge in A.C. Two-Part Tariffs, 131, 267
Cleansing, Public: Collection, Treatmentand Utilisation of Town Refuse, 269
Coal Distillation, 121
Coal Handling, 826
Coal Mine Lighting, 830
Coil Winding, 313
Collieries, Electricity in, 472
Communication Company, Australia and the, **518**
Comparisons, Odorous, **186**
Competition, E.T.B.I. [" Commercial "] (C), 52, **158**, 175, **418**, 446, 746; Royal Society of Arts Industrial Designs, 172; " Daily Mail " Ideal Homes, 465, 715; Novel Cooker, 462, 510; [" Elcook "] (C) 602; [" Dubious "] (C) 637, (C) 739; [Cousins] (C) 712
Condenser Tube Corrosion, 830
Conductors, Hollow, 223
Conferences:—
Association of Public Lighting Engineers', Annual, **321**, 327
Electrical Contractors', 1, 3
E.D.A. Salesmanship, **392**, 405, **483**, 497, 636
E.D.A. (Manchester), 688
High Tension [Rich], 19
Electrical Association for Women's Annual, 87
Electricity Supply in Rural Areas, 115
Second World Power, **239**
Congress, International Illumination, **729**
Congress of the Institute of Metals, 148
Consumer, Domestic, 246
Contracting Episodes [" Elcon "], 604, 765
Contracting, Electrical [Freeman], 798
Contractors, Advertising for, [" Publicity Consultant "], 77, 194
Contractors, Manufacturers and Supply Undertakings, Mutual Responsibility of [Bruty], 1, 8
Contractors, Registered Electrical. List of, **44**, 59, 147, 316, 473, 619, 752
Contracts Placed During the Year, Some Outstanding, 811
Convention: British Association of Display Men's, 36
" Cooker, Padlocked," **100**
Cooker Trade, Electric, 28
Cookers, Electric, Export Packing of, 121
Cookers, Electric, Progress in the construction of [Bickell], 799
Cooking, Electric, Economies of [Edwards], 596
Cooking, Electric, Railways and, **130**
Cooking Possibilities, Restaurant, **758**
Cooking on Trains, 226
Cooking Utensils, Electric, **701**
COOPER, T.: Recent Electrical Progress in India, 45, 141, 165
COOPER, W. FORDHAM: (C) Researches in Circuit Breaking, 142
Copper Refinery, New, 427
Corrosion and Water Flow, **130**
Corrosion, Condenser Tube, 830
COMPTON, COL. R. E., and EKSTROEM, DR. A.: Overhead Lines or Underground Cables, 567
COUSINS, A. B.: (C) Electric Cooking is Cheap, 712

D

Daylight, Artificial [" Lighting Consultant "] 354
DE GRAVE, L. W.: (C), Where *is* That Battery, 432; Review of Developments in Storage Batteries in 1929, 794
DENCH, E. A.: Stagecraft in Electric Home Displays, 76; Electrical Windows and Christmas Trade, 605; " Dressing " the Shopping District for Christmas, 762
" Despotism, The New," **553**
Development, Electrical, in London [" A Mere Consumer "] (C), 80; [" Another Consumer "] (C), [" Pro Bono "] (C), 110,
Diagram, Circle, of the Induction Motor [Carr], 24
Diaries, Faraday's, **658**
Dielectric Structure and Behaviour [Gillett], 423
Diesel Engine Manufacturers' Association, American, 280
Diesel Engine Plant, Progress in the Use of [Porter], 795
Diesel Engine Users' Association (New Headquarters of), 716 (meeting), 766
Dinner Need, A, **484**
" Dressing " the Shopping District for Christmas [Dench], 762
DUNTON, A. R.: Technical Progress in Insulating Materials in 1929, 793
DUNTON, A. R. and MUIR, A. W.: Asbestos, 663; Insulated Magnet Wires, 295; Insulating Papers, 419
DUNTON, W. F.: (C) " Researches in Circuit Breaking," 79
DURTNALL, W. P.: (C), Where *is* That Battery, 466, 569

E

East End Hostel Association, Annual Dinner of the, 36
EDWARDS, H., Economics of Electric Cooking, 597
Eggs, Electricity and, 504
Electrical Age, The [" Elecage "] (C), 224
Electrical Association for Women's New Branch in East Devon, 504
Electrical Association for Women, Propaganda of, **657**
Electrical Contractors' Association, Annual Conference, 1, 3
Electrical Contractors' Association, Chesterfield Sub-Branch Annual Dinner, 712
Electrical Development Association, Activities of the, 2
Electrical Power Engineers' Association, Annual Dinner of the Southern Section, 496
" Electrical Security," **1**, 74
Electrical Trades' Benevolent Institution, Appeal of the, **484** [Marryat] (C), 499, 603, **589**
Electrical Trades' Benevolent Institution, Festival Dinner of the, **658**, 681
Electricity Doomed, **294**
Electricity in 1929, **783**
Electricity, Prospects of Development of, 139
Electricity Supply Industry, Developing the [Moss], 737
Electricity Supply Rifle League, Annual Dinner, 746
Electricity Supply in Cornwall, 834
Electricity Supply, Southend's, 640
Electricity, Use of, **702**
" Electrics " of Yesteryear ?, Where are the, **266**, 276 [" Battery Electric "] (C), [" Etubrute "] (C), 332
Electrification, Need for Rural [Matthews], 829
Electrification, Rural, **186** [" Agelec "], 396
Electrification, Rural, The Contractor's Part in [Taunton], **1**, 13
Electrification, Rural, in Japan, **554**
" Electrificatzia," **418**
Electro-Farming, Review of Progress in, During 1929 [Matthews], 790
Electroplaters' and Depositors' Technical Society's General Discussion, **70**
Engineering, Illuminating—As It Shouldn't Be [Sylvester], 191
Engineering, Temporary Expedients in, 676
Enquiry, Dorking, **99**, 116
Equipment, Manufacturers', 51, 170, **418**, 437, 538, 573
ERIKSON, P. E.: Progress of Telephony During 1929, 791
" Ever-Ready " Selling Week, 280
Exhibitions, Value of, to the Electrical Industry, 771

EXHIBITIONS—

Aero, International, 148
Bradford Engineering Society's, 542
Brighton Electrical, 405, 469, 505
Commercial Motor Transport, **554**, 615
Electrical, **265**
Inventions', **418**, 443, 503
Manchester " Daily Despatch " Smoke Abatement, 537, 642
National Radio, **349**, 369, **392**, 404
Royal Institution, **627**
Shipping, Engineering and Machinery, 305, 374
Textile Machinery, 541
Explosion at Prince's Station, Nechells, 712
Explosions, Holborn Subway, 643
Extensions to Ilford Electricity Works, 25

F

Factories, Electricity in, **158**
Fair, British Industries, 407, 472 [Vignoles] (C), 432, **701**, 771
Fallacy Re-exposed, **44**
Fan Performance, Testing, **185**
Faraday Electromagnetic Centenary, **185**
Farm, Electric Service for the, 193
Farm Electricity, 223
FENEMORE, A. S.: Economic Choice of Engineering Plant, 323, (C), 403
FENNELL, W.: (C) Ferro-Concrete Poles, 224, (C) 276, (C) 403; Overhead Lines or Underground Cables, 602
Figures, Some Startling, **321**
Finance, Municipal, 182, 318, 550, 697
Fire, Cable Subway, 50
Fire-Charge Collector, 539
Fire Disaster, Smethwick [Rowell] (C), 739
Fires, Country House, **266**
Fires, Gas, and Healing Rays, **628**
Fittings and Appliances, Domestic, 86
FLADGATE, W. F.: (C) Battersea Power Station, 142
FORD, WALLACE: Methods of Measuring Temperature Rises of Electrical Machinery 630
Fountain, Bournemouth's Illuminated Electric, 749

Current Topics.

The Contractors' Conference.

IT is remarkable that in the comparatively short period that the Electrical Contractors' Association has been holding an annual conference, the conference spirit has become markedly evident. Each year sees a larger attendance—that at Bournemouth last week being a further record—and an increasingly free exchange of experiences which are of undoubted value, apart altogether from anything that may be learnt from the business sessions. Both the social and the business sides of the fourth annual conference were memorable, and the entire proceedings gave an impression of youthful vigour and zest that augurs well for the future of a trade organisation which, though one of the oldest in the electrical industry, has progressed farthest during the years since the war. If the natural beauties of the resort at which the delegates met facilitated enjoyment of the social functions, the quality and interest of the President's Address and of the two papers presented at the business meetings ensured the undivided attention of their crowded audiences. Mr. Walton's address provided eloquent testimony to the value of having a President with sufficient vigour and personality to get things done, and his plan for compiling a national trade register is a statesmanlike project of which more will doubtless be heard in the near future. The plan is one which will call for the expenditure of a very considerable amount of time and trouble, but as Mr. Walton and his associates have given unmistakable proof that they will not be daunted by any preliminary obstacles standing between them and complete realisation of their trading policy, it may be assumed that the register will, before long, be in active preparation.

The Irish Contractors.

MR. BRUTY'S laudable aim of increasing co-operation between the various sections of the electrical industry was somewhat discounted, if only temporarily, by his rather bitter remarks—even though they were couched in general terms—about certain electrical manufacturing firms, but it may be that, like the surgeon's knife, this laying bare of a sore place will lead to a healing of the wound. Undoubtedly the Irish contractors have been having a rough time of late, and it is well that their colleagues in this country should know of the difficulties with which they have to contend, and also of the assistance they have received from their trade organisation in the time of adversity. Somewhat unexpectedly, Mr. Taunton's paper on rural electrification possibilities from the contractors' point of view attracted a long and most informative discussion, and Mr. REYNOLDS'S recapitulation of what has already been done in the supply area of the S.W.S. Co. in a field which so many people have heretofore regarded as being destitute of immediate possibilities. With such a striking practical example as guide, other supply authorities and contractors have something definite to go on, and though, in some areas, such widespread rural electrification may not be immediately practicable, a start of some kind can be made in most districts. It was a pity that the authors were not asked to summarise their papers, as, in each case, the almost verbatim reading of matter which had been printed and circulated to all delegates some days before the conference occupied so much time that a number of prospective speakers could not be called upon. Anyone sufficiently interested in a paper to take part in its discussion would naturally have read the paper before the meeting, so nobody would suffer through such curtailment. On the other hand, those who might have had other views to offer might well have felt hardly done by through the operation of the "guillotine." Mr. WILLOUGHBY-ELLIS, the new President, shows every promise of further enhancing the prestige of the E.C.A. and its allied organisations, and, from what we know of him, contractors can look forward to considerable further progress under his urbane guidance during the coming year.

"Electrical Security."

CONTINUING the educational work recently inaugurated by the National Register of Electrical Installation Contractors, the E.C.A. has just issued a finely-produced booklet, entitled "Electrical Security," which is intended to place before architects and consumers of electricity in general a statement in clear and non-technical terms concerning the principal points to be observed and the pitfalls to be avoided, in order that the maximum benefit may be derived with safety and security from electrical installations. It discusses the need for electrical "safety first," emphasises

Digitized by Google

the value of a sound installation, gives examples of the cost of good and bad work, and has a preface by Mr. WALTER TAPPER, President of the Royal Institute of British Architects. Delightfully printed and made up, it contains no direct advertisement of its sponsors except a statement that it is published by the E.C.A., and on the last page, where a paragraph states that "Where the professional or trade standing of any firm of electrical engineers is in question, reference should be made to the list of members of the Electrical Contractors' Association . . . and/or to the National Register of Electrical Installation Contractors." We are particularly glad to see this spontaneous reference to the National Register; both bodies have the same objects in view in this matter of sound installations, and though they must necessarily approach the problem from slightly different angles, their joint aim will best be realised by such mutual assistance as is implied in the mention to which we have referred. The booklet is a production which reflects the very greatest credit on the E.C.A., and we hope and believe that its circulation will be productive of a great deal of good.

The French Radio Industry.

CONSIDERABLE significance attaches to the announcement made in a French contemporary that an extremely close agreement has just been concluded between the Société Française Radio-Electric and the Western Electric Co. Under the terms of this agreement it appears that the former acquires all the radio patents of the latter, but will in future only manufacture American material. At the same time, it is stated, Western Electric, Thomson-Houston, and Matériel Téléphonique undertake not to concern themselves with wireless telegraphy and telephony in France. According to "Haut Parleur," which makes the above announcement, the agreement means, in fact, the destruction of the French wireless industry.

The Electrical Research Association.

IT is a little over twelve months since we drew attention to the financial position of the British Electrical and Allied Industries Research Association, and we publish elsewhere in this issue the contents of a letter which, signed by leading men in the electrical industry, points out that the demands on the Association are such that help on a more liberal scale is urgently needed. The importance of the Association and the nature of the work it performs are already well known, The bulk of the income of the Association is at present derived from manufacturers, and though they in their turn derive benefit from the researches which the Association conducts, such benefit also extends to other branches of the industry, branches which, up to now, do not appear to have contributed their fair share of financial support. Amongst these latter is the electricity supply industry, and representatives of all branches of the electrical trade have therefore decided in conference to appeal to such authorities to find a larger proportion than hitherto of the annual income, on the basis of a subscription of £10 for each £25 000 of annual revenue derived from their sales, when the constitution of the governing council would be so modified as to give equal representation to both supply and manufacturing interests. It is understood that about £1 000 000 a year has been saved to the supply industry during the last eight years as a result of researches undertaken by the Association, and, since the contributions from this branch of the industry amount to but £5 000 per annum, it is hoped that the work of the Association will in future not only be better appreciated but unhampered by lack of funds. The field of research is by no means fully explored, and since supply authorities will benefit from such research in equal proportion to other branches of the electrical industry, it is expected that they will play their part in bringing the Association's plans to a successful issue. Their appreciation of past favours seems to have taken the form of gratitude, but, since future development cannot be conducted on such reward, expectation of further economies must be encouraged by cash. If the funds necessary to carry on can be secured, there is good reason to believe that the Department of Scientfic and Industrial Research will favourably consider a continuation of its support and will contribute pound for pound for subscriptions received by the Association in excess of a minimum to be decided later. Results of signal benefit to all concerned have already been obtained; the promise for future benefits is bright. Those who have benefited are asked, therefore, to take their share in the endeavour to enable the Association to continue and extend its efforts, and, with the assistance from the Department of Scientific and Industrial Research, which we are confident such efforts will secure, to construct a sure foundation for the extension of our industry.

E.D.A. Activities.

THE current selling campaign of the E.D.A. is designed to cover both July and August, and the attractive window display for those months is entitled "Other Summer Uses." The appliances which form the subjects of the window are those suitable for table use, such as toasters, coffee percolators, etc., while electric irons and fans are also included. The electrical contractor desiring to make the most of the campaign should remember that during the summer, owing to the longer period of daylight, outdoor publicity is especially valuable. People spend more time out of doors, particularly during the evening, when the mind, relieved of the occupations of the day, is more receptive to advertising suggestions and appeal. E.D.A. posters therefore should not be overlooked, for, used judiciously through the summer, they will help materially the more intensive development work which will commence in the autumn. In this connection, it is interesting to note that the E.D.A. has introduced a special poster frame and a poster screen, each of which will display twelve posters. Both these fittings may be quite usefully employed in the showroom, the gay colours of the posters giving added attraction to the surroundings. We understand that the E.D.A. has preparations already in hand for work during next winter, one of the principal activities of which will be a campaign to encourage more adequate electric wiring of houses and premises. The association will, in fact, develop the work which the Electrical Association for Women started in their Outlet Campaign. The work already done shows that the public, architects and builders are all interested in this development, and it is clear that such a campaign, designed to appeal to all grades of society, will have far-reaching results. The campaign should also be of great value to the electrical industry, as it will tend to increase the average size of installations and make the public, the builders and architects realise the necessity for spending an adequate sum of money on the provision of the electrical installation.

Electrical Penetration in Belgium.

THE development of the use of electricity in Belgium is making such progress that it will not be long before even the most rural area has its supply. Consumption of power for both industrial and domestic purposes is being encouraged by propaganda, whilst the network and distribution of power and light are spreading all over the country. The construction of a high tension line between Louvain and Liège has completed the junction between the eastern and western parts of the country, whilst the line which links up the new central station of Schelle with those of the Charleroi Basin is in process of construction. This line when completed will ensure the junction between the northern and southern parts of the country. Moreover, four central stations in the Province of Hainaut will be linked up by lines of 70 000 V, whilst the construction of the h.t. line between the central station of the Warche and the station belonging to the Linalux at Liege is in process of realisation. The last centre will also be connected with a central power station at Auvelais by means of a line which will run partly through the Ardennes. As far as privaté companies are concerned, their lines continue to extend even into the smallest hamlets.

THE E.C.A. CONFERENCE.

Big attendances at Bournemouth Meetings — The Mutual Responsibility of Contractors, Manufacturers and Supply Authorities — Possibilities for Contractors in Rural Electrification.

EACH time we write about the annual conference of the Electrical Contractors' Association and its allied organisations, we feel the need for more superlatives. The one which was held in the delightful town of Bournemouth during the latter part of last week was the fourth of its kind, and even if there might be some room for difference of opinion as to whether it was the most enjoyable, there is no doubt that it was by far the best attended, the total number of members and their friends registered for the conference reaching more than 450.

The visitors were favoured throughout with extraordinarily good weather, and this, together with the delightful natural surroundings and the handsome new Pavilion, in which several of the social functions were held, added materially to the enjoyment of the proceedings.

The social programme opened on the evening of Wednesday, June 26th, when the delegates were received in the ball room of the Pavilion prior to a dance which drew a large attendance.

Real business started on the Thursday with the annual general meeting at the Town Hall. This was followed by an address of welcome by Ald. C. H. Cartwright, Mayor of Bournemouth, and the President, Mr. W. H. Walton, after acknowledging the warm welcome extended, delivered his Presidential Address, which, together with the papers and discussions dealt with at the meetings, is reproduced in part in the pages that follow.

The afternoon session was occupied by the reading and discussion of Mr. A. G. Bruty's paper on "The Mutual Responsibility of Contractors, Manufacturers, and Supply Undertakings (*a*) to the Electrical Industry, and (*b*) to the Public." The discussion on this paper was long and interesting, and the time for adjournment arrived with several prospective speakers unable to have their say.

The evening was passed happily at a smoking concert at the Pavilion Restaurant.

On the Friday morning the Conference reassembled at the Town Hall, when Mr. H. R. Taunton read his paper on "Possibilities for Contractors in Rural Electrification." This elicited a surprisingly well-informed discussion which well repaid the foresight of the author and of the Association in selecting so live and new a topic.

After coffee Mr. Walton moved the vote of thanks to the Corporation of Bournemouth and installed Mr. H. Willoughby-Ellis as the new President. That the selection met with popular approval was evident from the hearty manner in which the new President was received. At the close of the meeting, the official photograph was taken, and in the afternoon the delegates left by special train for Southampton, where the R.M.S. "Aquitania" was inspected. Tea was served at the South Western Hotel, Southampton, and the party returned to Bournemouth in good time for dinner, preparatory to the ball and supper which was given at the Town Hall by invitation of the Mayor of Bournemouth. Dancing proceeded until the early hours of Saturday, and though a large number of the visitors left for home that day, a considerable number stayed over the week end.

The general impression was that the fourth Conference had been a worthy successor to the others, and the eager interest shown in regard to rumours as to the position of the next conference centre seems to augur well for the next gathering a year hence.

THE PRESIDENTIAL ADDRESS.

High Standard Set by Association Maintained—Co-operation with the National Register—A Hand-Book on Installation Work for Public Consumption—A Trading Register for Discount Regulation.

IN his presidential address delivered at the opening of the conference on Thursday morning, Mr. W. H. Walton recalled that last year at Cheltenham he had suggested that the efforts of the Association should be directed along three main channels: (1) to the development of the Association itself; (2) to the promotion of better trading understandings with all other sections of the electrical industry; and (3) to secure the closest possible co-operation between E.C.A. members and all electricity supply authorities.

The time was opportune to inquire what progress had been made during the past twelve months in these important directions. In considering the development of the Association itself it must be realised that "development" represented a very comprehensive term. The word immediately suggests two alternatives, quantity and quality; he placed "quality" first, leaving "quantity" to settle its own dimensions.

This Association had always concerned itself seriously with the technical and business standing of its members; but in view of the hosts of untrained and inexperienced men who were prepared to carry out any electrical work they could find, and in view of the danger to the public and discredit to the industry thereby brought into being, the Association had been compelled to scrutinise the credentials of new applicants for membership with greater care than ever.

Mr. W. H. Walton, President of the E.C.A.

They were perfectly willing to confer the advantages of E.C.A. membership on sound and dependable men capable of rendering good service to the public, no matter how small their individual businesses might be; but they were not prepared to recognise the untrained and inexperienced worker who represented such a blight on the installation trade of to-day.

In this matter during the past year they had entered into the closest collaboration with the National Register of Electrical Installation Contractors to achieve identically similar ends. As a direct consequence of these conversations the National Register had published what might be termed a "crime sheet" designed to assist the removal of any questionable installation engineer already attached to the Register.

In this matter, it is an individual and collective duty to assist the Register to expose all shoddy workmanship whenever the means to that end came within reach. It was useless to suffer in silence or grumble in private. If Registered Contractors were abusing their certificate by executing potentially dangerous work, it was a duty to report such instances to the Executive Committee of the Register for careful examination and drastic treatment. The job was a thoroughly unpleasant one to have to undertake, but in this, as in all other matters, electrical contractors must put their own house in order.

The next move of the E.C.A. had been to raise the status of all dependable installation engineers, not only within the industry itself, but also in the eyes of allied and associated professional interests. In this direction steps had been taken during the past year to improve the appreciation of sound electrical work among a very important section of the professional community, namely, among all architects and surveyors practising in this country. With this object in view, neither trouble nor expense had been spared to produce a handbook devoted to really worthy installation work, and it was hoped and believed that this publication would go a very long way to enlighten an important section of the community concerning the short-sighted folly and essential danger of cheap and nasty electrical work.

In approaching the professional gentlemen they had had in view, they had been particularly fortunate in obtaining a preface to the booklet from Mr. Walter Tapper, A.R.A., President of the Royal Institute of British Architects. In this preface, Mr. Tapper gave a clear lead in favour of sound electrical installation work at a fair price.

Mr. Walton desired to make it perfectly clear that in this booklet they had made no attempt to boost individual firms or groups or associations of firms. They had attempted no sort of "advertising" as such. They had sought to explain the difference between good work and bad work. They had attempted to state the case in favour of good and convenient installations, and set forth the arguments against shoddy and inconvenient installations, thereby giving the architect an opportunity of appreciating the prime cause of the widely different tenders he might receive for one and the same piece of work.

During the past year they had had some anxious moments in their dealings with organised labour, but, regarded broadly, sane and good relations had been satisfactorily maintained.

In the direction of promoting better trading understanding with all other sections of the industry, very sound progress had been made during the past twelve months.

Coming to a matter which he regarded as of very great importance indeed to their future trading welfare, Mr. Walton referred to the National Trading Register which, it was proposed, might be applied to the whole electrical industry. Substantially more than half of the trading troubles of their own section of the electrical industry arose as a direct consequence of discount misunderstandings, and, in other cases, misapplications.

A reform calculated to strike at the very root of such troubles would be provided by a National Trading Register clearly defining all firms and individuals entitled to any electrical discount whatever. Recognised wholesalers would be registered as entitled to wholesale terms; recognised retailers would be registered as entitled to ordinary trade terms; while larger buyers would equally be registered as entitled to agreed quantity discounts. Trade terms, as such, would be allowed to nobody save those actually in the electrical trade or carrying on allied trades for the production of semi-electrical goods for resale; while all other buyers would be entitled to quantity terms or no special terms at all, depending entirely on the magnitude of their annual electrical requirements.

At first glance, such a comprehensive Register appeared to represent too large a task for practical and effective achievement, but he was confident that such is not the case.

THE ANNUAL REPORT.

Activities of Association During Past Year—Membership Still Increasing—The E.C.A. and the National Register—The Contractor and the Supply Authority.

THE business of the conference opened with the annual general meeting, held at the Town Hall on Thursday, when Mr. W. H. Walton (President, E.C.A. and Allied Associations) presented his annual report.

He said that while the past year had brought forward no spectacular achievement, the activities of the Association continued to increase, and he was personally very gratified at the progress that had been made in several important directions. The progress in many directions was necessarily slow, but in his opinion it was none the less sure, and he believed it would have very far-reaching results, not only so far as the electrical contracting section of the industry is concerned, but also in the development of other sections.

Membership showed an increase during the year, and the few old-established contractors in the country who, for reasons best known to themselves, had held aloof from the Association were now recognising the value of united effort and were throwing in their lot with the Association.

Before proceeding with a brief survey of the Association's activities during the past year, Mr. Walton said he wanted to make one personal appeal to the membership.

Not only in the industrial world, but throughout the whole life of the community, apathy is responsible for many failures, and he begged all members to regard the Association's business as an integral part of their own lives and businesses, and give it the attention it deserved. After all, the Association belonged as much to any one member as to any other.

Since the last annual general meeting, a certificate had been obtained from Messrs. Price, Waterhouse and Co., with regard to the overhead expenses associated with the businesses carried on by their membership. The figures which had been circulated were extremely interesting, and already definite progress had followed the preparation of this document. He could not too strongly emphasise the necessity for every member to pay adequate attention to the Price, Waterhouse figures, and thus do his best to ensure that every job he carried out bore its proper proportion of overhead expenses. Only on these lines would they promote a really healthy state of affairs in the contracting section of the industry.

"I am, of course" he continued, "conscious of the price-cutting practice of certain firms which appears to go on unchecked; but to the best of my knowledge, no association has been able to prevent people pursuing a policy of losing money on contracts if they really wish to do so. In my opinion, however, it is far better to do a quarter of the work at a reasonable profit, than to do a very great deal without sufficient margin for overhead expenses, let alone profit. A committee of the Association has utilised the information supplied by Messrs. Price, Waterhouse and Co. in its negotiations with various Government Departments, etc., and although

a certain measure of success has already been achieved, I have reason to believe that more satisfactory progress will be made in the near future.

"All members will now be aware of the new regulations which have been introduced by the National Register of Electrical Installation Contractors. I believe that this effort on the part of the Registration Authority to improve the status of all those admitted to the Register is fully appreciated by all members of the E.C.A. I may add that, during the past year, close co-operation has existed between the National Register and the E.C.A. which, to a very large extent, has been responsible for the new regulations now put into force.

"You will also remember that at the commencement of the year, the Association supported the National Chamber of Trade in its resolution for *compulsory* Registration. Although the National Chamber did not see its way at the time to pursue the request for compulsory registration, it has signified its intention of exploring all possible means to secure a National Code of Wiring Rules.

The President went on to recall that at this time last year a proposal was brought forward to issue a pamphlet for distribution by electrical contractors to the public, emphasising the need for better installations. The proposal was, however, left in abeyance in view of a decision to publish a book upon the same subject particularly directed to architects and others who are frequently responsible for giving out electrical work. The book contained a preface by Mr. Walter Tapper, the President of the Royal Institute of British Architects, and was designed to emphasise the need for greater care to be exercised in considering tenders for electrical installation work.

The Council had regarded it as a duty to issue such a publication, and he was strongly of the opinion that the effort would go a long way to advance the interests of those in the industry who were anxious to carry out work of a good and sound nature, as against those whose only aspiration seemed to be to carry out work of any description at the lowest possible price.

The Law and Parliamentary Committee, under the guidance of Mr. W. Cross, had been particularly active. A very considerable amount of time and effort had been spent with a view to promoting the true spirit of Clause 48 of the Electricity (Supply) Act of 1926. The wording of this clause was well known to all, but the spirit behind the Clause breathed the word "co-operation." A large number of negotiations between the contractors and supply engineers had taken place in all parts of the country during the year, and, on the whole, the arrangements thus arrived at had been extremely satisfactory.

It must be remembered, once again, that the chief function of the supply authority was to sell the energy it generated, and he was quite convinced that if supply engineers were satisfied that contractors were rendering the service required to develop the consumption of energy, they would be prepared to recognise the contractors' efforts in a fair and reasonable way. It must not be lost sight of that if contractors failed to pull their weight and were not absolutely up-to-date in their selling of current-consuming devices, they could not possibly deny the supply authorities' right to take a hand in the work. Contractors must always remember that, as electrical contractors, they had a definite obligation to other sections of the industry, in addition to their direct duty to the public. One of their definite obligations was to equip their public displays so effectively that they were a potent factor in the locality. So much having been achieved, there would be no need for the supply authority to enter into competition.

The twenty-fifth anniversary of the Association's Charter of Incorporation was certainly a significant one so far as the Apprenticeship Committee was concerned. This year could be regarded as an extremely important one from the point of view of apprenticeship in that, during the year, the Committee had been successful in organising an Advisory Committee representing all interests from the electrical and educational points of view. The future of the industry was wholly dependent on the boys we were training to-day, and it was this single thought which had prompted the E.C.A. to devote so much attention to apprenticeship matters.

The Council had, during the past year, drawn up "Standard Conditions for Cost Plus Percentage Contracts" and "Conditions of Tender and Contract for Electrical Installation Work." The documents were now in the hands of all members, and he wanted to drive home the strong recommendation already made by the Council, that these forms and conditions should be utilised in place of the many varying documents hitherto used in the trade.

The Council, during the past year, had passed certain resolutions referring to electrical installation work for submission to the Electricity Commissioners and to the Institution of Electrical Engineers, and these could be classified under the following headings :—

(*a*) *Earthing.*—The question of "Earthing" *versus* "Insulation" has been discussed at very considerable length not only by the Council, but by Branches; and, in addition, by many outside bodies, not forgetting the informal discussion under the auspices of the I.E.E.

(*b*) *The introduction of more than one phase of a supply system into one room.*—The Association has voiced its views very definitely upon this subject, and, mainly as a result of the protest which had been made, the Institution has recently set up a special Committee to consider the whole subject. This Committee is under the independent Chairmanship of Dr. Eccles, and the Association has been invited to appoint a representative to serve thereon.

(*c*) *Standardisation of Pressure.*—The extensions which are taking place in various areas without any apparent attempt to standardise the pressure of 230 V, as adopted by the Central Electricity Board, has been considered by the Council, and a resolution has been sent to the Electricity Commissioners and to the Institution of Electrical Engineers, stressing the necessity to do all in their power to ensure the early standardisation of pressure in all areas.

The activities of the N.E.C.T.A., Ltd., had, by the very nature of its constitution, been principally devoted to trading matters, not forgetting, of course, that the finances of all three Associations were in the hands of the company. No one

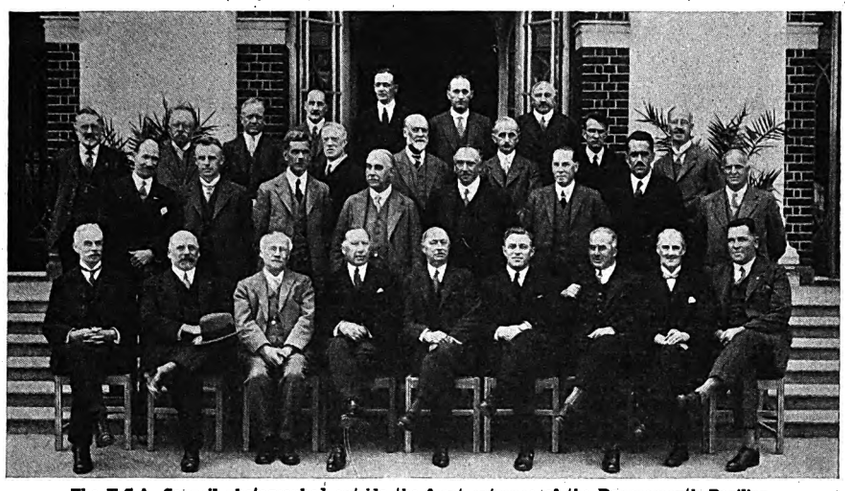
who was kept regularly posted with the minutes of the meetings of the Trading Committee would have any doubt as to the intensive efforts put forward this year. Indeed, he ventured to suggest that these efforts had been equal to, if not greater than, in any previous year of the Association's history.

The Committee's efforts to secure a National Trade Register for the whole of the electrical industry would not be new to a large number of members who had been cognisant of the activities of the Committee, but the subject was of such real importance that he was anxious to explain what is in the minds of the Trading Committee.



The E.C.A. Council photographed outside the front entrance of the Bournemouth Pavilion.

The electrical industry possessed so many sections, and in each section—particularly on the manufacturing side—there were so many kinds of material requiring different treatment, that any system of ordered trading seemed impossible by simply agreeing and adhering to particular formulas. Although the Association adhered to its policy that trade discounts shall be reserved exclusively for those in the trade, one must not overlook the very large buyers of electrical apparatus for their own use, who obviously must receive considerably better terms than the ordinary private buyer. As an example it was unthinkable that a user requiring the supply of 1 000 similar articles could not buy them at better prices than the thousand individuals who required only one each.

This argument alone justified, in his opinion, an agreed schedule of quantity discounts, available not only to the trade but to all classes of buyers. Unfortunately, however, a system of quantity discounts did not seem to meet the bill. At the present moment there were a very large number of industrial buyers who demanded, and received, the full trade discount upon their requirements, and although the efforts of the Association had gone a very long way to get rid of this practice, the fact remained that if one particular manufacturer or wholesaler withheld the trade discount, ways and means were usually found to obtain it from another source of supply.

In the opinion of the Council, this chaotic state of affairs could be satisfactorily corrected only by the introduction of such a Trade Register as that to which he had already referred. The intention behind the suggestion was that every buyer of electrical apparatus throughout the whole country should be graded. The Register thereby created would indicate at a glance :—

(*a*) Those to whom wholesale terms should be allowed ;
(*b*) Those contractors and/or retailers to whom the trade discount should be allowed ; and
(*c*) Those buyers who, for some special reason, are entitled to some discount to be mutually agreed between all sections of the industry.

The compilation of such a Register was, of course, a colossal task, but he was convinced that the utility of it would more than justify the trouble and expenditure which would be necessary to carry the project through. Those who said the task was too vast might be referred to the E.L.M.A. Register. The Register he had in view was much more comprehensive than that, but he was certain the task could be accomplished, and equally certain that the time and trouble involved would be amply justified by results.

In his personal opinion, the introduction of such a Register was the only solution of the chaotic conditions at present existing in the trade, and he was very pleased to report that an informal committee representing the majority of interests in the electrical industry had accepted the suggestion for recommendation to all concerned.

To say that in their negotiations with E.L.M.A. during the past year they had achieved all that they wished would be a very incorrect statement of the views of a large number of the members. He did not think it could be denied, however, that the progress made was not only very significant, but of extreme importance, and that it would have very far-reaching results in the future.

Mr. Walton said he referred particularly to the introduction of a new Register, the names upon which would be reserved as the exclusive province of E.L.M.A. retail agreement holders. The List already comprised a nucleus, and arrangements had been made by which additional names could be added to the List. Once such names were added they remained the legitimate province of the retailer, and were immune from attack either from manufacturer or wholesaler. In his opinion, a very important principle had been established by securing such an innovation.

The President contended that these same negotiations with the E.L.M.A. had placed a valuable asset in the hands of the contractor ; but, with this asset, there was also a very definite obligation. Obviously, the E.L.M.A., in making the concession, had done so in the hope that these buyers of E.L.M.A. lamps would continue to consume them, and that contractors would so nurse their clients that there was no possible chance of the business falling off to other than E.L.M.A. manufacturers.

The Association's relations and negotiations with other sections of the industry continued to be most cordial, and frequent meetings and discussions had taken place during the past year. The continued phenomenal growth of the industry demanded that contractors should adopt the most up-to-date and live methods of disposing of current-consuming devices.

He was generally of the opinion that if contractors were in a position to display fittings and current-consuming apparatus really adequately and thereby ensure the sale of the manufacturers' products in the quantities they desired, manufacturers would much prefer the business to go through the trade.

As never before, the present was a day when advertising was of the utmost importance, and it was interesting to note that many old-established and conservative firms, who had done little advertising in the past, were now doing so with considerable vigour.

The National Federated Electrical Association, being a Trades Union, dealt almost entirely with the labour side of the electrical contracting industry, and there appeared to be very little of spectacular importance which justified discussion. Wages had continued to operate in accordance with the National Sliding Scale Agreement of September, 1921, and although an application was put forward by the Electrical Trades Union for a national increase, this was not granted. However, a 5% rise was given in the London area.

There appeared to have been a tendency in one or two districts to break away from the National Agreement under which wages and other conditions were controlled ; but, from the point of view of the Association, every effort would be put forward to maintain the present national arrangement.

In concluding his report Mr. Walton made particular reference to the activities of the Chairman of the Main Committees of the Council for their loyal service. Mr. Shaw had once again ably directed the Development Committee in its deliberations, and the Trading Committee had had for another year the admirable guidance of Mr. H. Marryat. The work of Mr. Cross, the Chairman of the Law and Parliamentary Committee, had been referred to, and he wanted to add his appreciation of the services of Mr. Robson as Chairman of the Apprenticeship Committee, a position he had decided to relinquish, after practically a quarter of a century of service in various capacities on behalf of the Association.

The Labour Committee's activities, although conducted to a great extent without publicity, were none the less intricate and involved, and the Association owed a tremendous debt of gratitude to Mr. Walter Riggs, who had acted as Chairman for the past few years, and who had now retired from office.

MUTUAL RESPONSIBILITY OF CONTRACTORS, MANUFACTURERS & SUPPLY UNDERTAKINGS.

Mutuality of Responsibility—Importance of Tariffs—The Irish Contractor—The Domestic Hot Water Problem.

By A. G. BRUTY, M.I.E.E.

MR. A. G. BRUTY in his paper on Thursday afternoon said that the mutual responsibility of supply authorities, manufacturers and contractors to the electrical industry lay, broadly speaking, in the direction of augmented goodwill, mutual recognition, and increased co-operation. To the public it lay in the direction of conscientious work and efficient service. We were, as an industry, far from fully recognising our responsibilities to each other, and in this way failing in our duty to the industry as a whole.

Mr. A. G. Bruty.

On every installation, no matter how simple or complex, there was mutuality of responsibility. The contractor called in to carry out the work decided upon suitable material for which he placed an order with a manufacturer. The manufacturer supplying such material under guarantee must rely upon the contractor to safeguard his reputation by seeing that it is properly installed and connected and the user carefully instructed in its use. The supply authority was relied upon for a supply of energy at reasonably constant pressure and periodicity without irksome conditions, and at simple reasonable rates.

In so far as the three parties co-operated to give the fullest service, to that extent had they discharged their mutual responsibility to the consumer, and to the same extent their duty to the industry.

This aspect of our daily work was too frequently overlooked. Even those put in authority over us were not free from blame in this respect. For example, a short time ago the Electricity Commissioners set up a Committee to consider the supply conditions and varying prices charged for electricity by supply authorities up and down Great Britain. The terms of reference were excellent, but what of the personnel?

The question of tariffs was of vital importance to manufacturers and contractors and their interest in this matter ought to be appropriately recognised.

Every contractor well knew there were hardly two supply authorities with similar tariffs and conditions of supply. It was part of the contractor's daily work to keep himself acquainted with supply conditions in all the areas in which he operates. He undertook the consumer's difficulties as well as his own, and if there was one class of person in this world who could speak with authority about the consumer's requirements, it was the contractor. He could give valuable guidance to any committee dealing with tariff and supply conditions. It was no less true of the manufacturer.

Unless rates were attractive and conditions of supply free from irksome restrictions there was a drag on the wheel of electrical progress and its reactions were felt throughout the industry.

While recognising that various and varying prices had been unavoidable in the past owing to location and size of station, load conditions, etc., etc., there did not appear to be quite the same reason for some of the supply authorities' regulations. For example, the prohibition of squirrel cage motors except of the very smallest sizes, coupled with stringent restriction of starting current, was a condition that in these days ought to be revised. In order to comply with the requirements unnecessary complications and expense were involved, resulting either in the abandonment of the electrical proposals or the adoption of a scheme where the full advantage of electrical driving could not be secured. Conditions which made the cost of the starting gear on the simplest and smallest electrical power installation more expensive than the motor ought to be the subject of inquiry, not by station engineers alone, but by all interested in the matter.

Another matter, in which manufacturers and contractors had a very definite interest, was the practice of supply authorities in many quarters making a charge for bringing in the most simple of services. One was told that it did not pay to put in a service for, say, a few lights. Judged by immediate results, this could be challenged, but one did not expect the consumer to stand still in the matter of electrical progress. Experience showed that in due time the lighting load would be increased, and an iron, kettle, radiator and all the rest would follow.

Most important of all was the question of the cost of electrical energy. Rates attractive enough to encourage heating and cooking except as emergency or short-hour expedients had, generally speaking, not been available until recent times, and even now were by no means general.

This would, we were led to believe, be changed in the future, when, with the national supplies now being organised, we looked forward to the day when rates would be such that the "all-electric" house would be within the bounds of practical politics.

A market for these abundant supplies had to be found. It would be found in one way only, and that by the co-ordinated effort of all in the industry. Not by grasping greed by one section to the detriment of the others, but by each section specialising in its own branch, avoiding overlapping and duplication of effort.

These thoughts were prompted by the development of the State-owned electricity undertaking in the Irish Free State. The generation, transmission and distribution of electricity for the whole of the country was in the hands of the Electricity Supply Board, and this Board had been given powers to wire, hire, sell, etc. During the passage of the Bill the Irish contractors, heartened by the measure of success obtained by their confrères in Great Britain, endeavoured to secure amendments that would leave the position in the Irish Free State no worse than in Great Britain. They failed. The idea of agreeing to the recognised retail price of an article was abhorrent to the authorities. The public, who were prepared to pay the proper price for other articles, were to be State-assisted in their electrical requirements.

Full use was being made by the Electricity Supply Board of the powers taken in the Bill. Wiring work was being carried out and showrooms had been opened for retail sales. Prices the author had seen for wiring work were such that no responsible contractor who wanted to remain in business could possibly quote. Assuming that quite cheap material was used, Trade Union labour was being employed, and proper provision made for establishment charges, there must be a loss on every light wired. How could a private trader compete in price under such circumstances?

A Difficult Position.

The Irish contractor had to comply with certain special requirements issued by the Board, and he lived in an electrical scheme of things where his work had to pass the inspection of his competitor, where he had to reveal his client's identity before commencing a job, and where, as far as one could judge, a squeezing-out process was in progress.

The contractors would not allow themselves to be squeezed out, and, in the interests of the national supply as well as the industry, it was to be hoped that the Board would before long reveal a disposition towards goodwill, recognition of the position of, and co-operation with, the contractors.

Turning to the manufacturer's interpretation of his responsibility the author first gave an example from the Irish Free State.

In the welter of cut-throat competition came the English manufacturer—not as one would imagine to help his friends, but to aid and abet the opposition, with an utter lack o responsibility. News was brought to the author's branch that one of a group of manufacturers, with whom the E.C.A. trading committee had very cordial relations, was supplying material to a competitor at a price at which no one in England or Scotland, not to say Ireland, could purchase it from the same sources.

Vigorous protests were made, and investigations proved that the news was true, but that the quality was lower than

(*Continued on page 10.*)

Digitized by Google

Digitized by Google

the standard purchased by E.C.A. members, and was supplied without guarantee.

In the circumstances now obtaining it was easy to see that any departure from stability in quality and price to one of a set of competitors was an attack (unconscious, no doubt) upon the others.

An Unfortunate Case.

Another group of manufacturers had within the last few weeks floundered into difficulties, and left the contractors in an unenviable position, simply because they failed to realise that the E.C.A. existed for any purpose other than their own selfish ends. Without consultation with people competent to advise them, these manufacturers entered into negotiations, made concessions and agreements, ignoring the consequences. This action of the manufacturers only became known when its reaction were felt in another direction altogether. When difficulties arose the whole dismal story was revealed. Not only did it reveal a complete and absolute lack of a sense of responsibility to the industry, as it had existed hitherto, but showed the manufacturers to be blind to their own interests.

In contrast to the examples quoted, it was gratifying to acknowledge that in Great Britain things seemed to be managed somewhat better. It was satisfactory to observe that there was in certain quarters a strong desire on the part of manufacturers to co-operate with the organised contractors to secure fair trading conditions.

The object of this industry in trading matters should be to ensure that the distribution of electrical goods should take the shortest route from the manufacturer through bona fide trade channels to the consumer. How was this to be done, and, in the doing, secure to those engaged in the industry a fair reward? Mr. Bruty thought the answer was to be found in the definition he had given to "mutual responsibility" in his paper. That the increasing volume of business secured by manufacturers last year was for the smaller class of apparatus rather than for contracts of considerable magnitude was indicated by the Chairman of Associated Electrical Industries, Ltd., at the annual meeting. This would indicate that expansion in domestic electrification was taking place. Here it was that the contractor's activities very largely lay.

And what of the contractor? Where does he come in the electrical scheme of things? He occupied a key position. He was the co-ordinator of the efforts of the other units of the industry into the ultimate services rendered to the public. He, generally speaking, did not manufacture, he certainly did not provide the electrical energy, but into his hands fell the arrangement of the installation, and by his service to the public in this particular he occupied an extremely responsible position.

And what of the public? In all parts of these islands there were definite indications that great expansion in the uses of electricity was upon us, if indeed, it had not already arrived. On every side there were evidences that the public were daily increasing their electrical demands. As the public acquired more and more the electrical sense, the demand would continue to increase until finally we should find that the "all-electric" house would be the rule and not the exception.

We were still looking for a complete solution of the domestic hot-water problem. Electrical engineers had given this matter considerable attention for some years past, and, although considerable advance had been made, it is unusual to find electricity used for domestic hot water, except perhaps during the summer or for topping up during the night in the winter.

It was evident that this anticipated expansion would bring with it added responsibilities. The general adoption of 230 V a.c. in Great Britain and 220 V a.c. in Ireland made it necessary that definite minimum requirements for the prevention of injury from shock and risk of fire should be strictly enforced.

Manufacturers must see that domestic appliances, no matter what kind, were so designed and constructed as to provide the contractor with adequate means for ensuring protection to the user. The contractor must see that these means were efficiently utilised, and the supply authorities should be effectively empowered to refuse to connect a supply to any premises where unsafe apparatus had been installed.

Mr. Rawlings, in a paper read at the E.C.A. Conference last year, dealt with the necessity of earthing the metallic covering of electrical apparatus for the protection of the public from shock. An examination of most of the domestic appliances at present on the market revealed the fact that a very small proportion of these had been designed with any efficient means for protecting the public.

If contractors were serious about this question, they had it very largely in their own hands to rectify it by refusing to permit in any installation for which they were responsible any apparatus not made, so far as was humanly possible, danger proof.

This association of responsible contractors realising the dangers of unsound workmanship and apparatus, and appreciating the responsibilities devolving upon them, had for many years pressed for compulsory regulations for electrical installations, but without success. Who could doubt that this reform is long overdue? What hope was there of securing it? In the author's opinion, very little, unless contractors had the wholehearted support of the other sections of the industry. Some would say this was hopeless. He hardly thought so. After all, what were the objections to such compulsory regulations? Was it that the manufacturers had failed to provide apparatus that would satisfy the requirements of the Institution of Electrical Engineers' regulations, and that consequently compulsion would be absurd? This objection could quite easily be met by fixing a day after which all installations would have to comply. Was it the fear of the supply authorities that a higher proportion of sound installations would increase the cost and slow down expansion? Whatever the objections they should be made known, and efforts made to meet them. Was it not possible for this Association to enlist the assistance of organised manufacturers and supply authorities, and with united strength press in the proper quarter for appropriate action? The whole industry should be identified with this reform.

Another matter of combined interest to the industry and its relations with the public was that of the training of labour. Training of the skilled men of the future was a subject that should rouse a very lively interest, as into the hands of the workmen must be left the final touches that would make or mar carefully designed installations.

The author would like to see some attempt made to increase the usefulness of the present apprenticeship schemes by the interchange of apprentices between manufacturers, supply authorities, and contractors. This interchange would be of very considerable value not only to trainees but to the industry as a whole.

There was one direction in which combined effort had rendered excellent service to the industry and to the public. He referred to the National Register of Electrical Installation Contractors. On this authority, which conferred a status upon responsible contractors, were representatives of every branch of electrical enterprise. It seemed to him that the success which had attended this co-operative effort should encourage us to further efforts along similar lines, seeking for means to correlate the interests, and generally to ensure smooth running of the wheels.

In conclusion, Mr. Bruty ventured to suggest to the conference that if they were in deadly earnest—as he most certainly believed they were—in the matters of service to and safety of the public, they should invite the other sections of the electrical industry to co-operate with them in the pursuit of compulsory wiring rules, compulsory registration of contractors, danger-proof electrical appliances, etc., where intersection goodwill or united pressure on outside bodies was necessary to secure the end they had in view.

THE DISCUSSION.

Mr. W. R. RAWLINGS said he was convinced that the electrical industry's greatest need to-day was a closer co-operation and understanding between its component sections, and this theme was the real keynote of Mr. Bruty's valuable and thoughtful paper. The quarrels of the early days of the industry were fortunately only a memory. In the early years of this century the presence of a lawyer had been indispensable in negotiations between the opposing companies, nowadays the lawyer was rarely needed on such occasions. He had great hopes that Mr. Bruty's paper would still further cement these friendly relationships.

Some fifteen years ago he had put forward the then revolutionary suggestion that all the electrical organisations should combine as one. The time for the achievement of this desirable reform seemed now within measurable distance. All sections of the electrical community were represented on such organisations as the B.E.A.M.A., the E.L.M.A., the B.E.S.A., and the I.E.E. It surely required but little effort to translate Mr. Bruty's proposals into action.

The author's reference to apathy recalled a personal ex-

Digitized by Google

perience of the early days which might serve to show that the apathy was not always on the contractors' side. In the case in question he had been obliged to guarantee the cost of bringing a cable to a domestic consumer who would not otherwise have been able to obtain a supply.

Mr. H. H. BERRY thought it was particularly significant that a gesture such as that which Mr. Bruty had made should come from the other side of the Channel, when we, over here, were so accustomed to believe that the people of Ireland preferred to fight if only for its own sake. There was no doubt that all sections of the electrical industry would wholeheartedly sympathise with this wonderful idea of fuller co-operation. He noticed, however, that Mr. Bruty had entirely overlooked the wholesalers in his chain of distribution; though this was probably because he had grouped them with the manufacturers as part of the necessary machinery of distribution.

An idea for which he was not personally responsible had a most important bearing on the situation. It was put forward by Dr. Ferranti to an executive meeting of the Council of the Electrical Development Association, representative of nearly all the electrical associations. Dr. Ferranti had realised the real importance of the domestic electrical development which would arise when the supply industry was able to give a cheap supply of electricity in rural and suburban areas where a cheap supply is not now existent. He therefore made the suggestion that the industry should formulate a uniform tariff which should apply throughout the country. There would be one rate for power and another for lighting. Whatever unit charge might seem satisfactory would obtain universally, and the varying costs of distribution in different areas would be compensated for by a variable fixed charge. The adoption of such a scheme would clear the way for phenomenal progress and would dispose of all existing anomalies.

Work for the E.D.A.

Mr. H. C. HAZEL said the value of Mr. Bruty's appeal to the different sections to work more together lay in his insistence that such a move was desirable not only for their own pecuniary advantage, but also as the industry's duty to the public. While there would be general agreement that the author's sentiments were entirely desirable there must be many who wondered how they were to be put into practice. He thought the E.D.A. was the ideal instrument for this purpose. It was a body which had no particular axe to grind, and with its area and circle committees, representative of supply authorities, manufacturers and contractors, it was particularly well fitted to deal helpfully with tariffs, the cost of services and other questions of direct interest to the general public.

Service Charges.

He agreed with the author in complaining of the charges sometimes made by supply authorities for giving service connections. This should certainly be free if the distance was reasonable. It was indubitably true that many potential consumers of electricity had become gas consumers simply and entirely because of the high price demanded for bringing a supply of electricity to the consumers' terminals. The policy was entirely wrong.

As to the consulting of contractors by manufacturers, Mr. Hazel thought it would be distinctly advantageous to manufacturers to seek such advice. Contractors more than any other section of the industry were in direct touch with the requirements of the user of apparatus, and there had been many instances of a product being entirely re-designed in accordance with suggestions obtained in this way.

Mr. R. GRIERSON suggested that in seeking the path of progress along the lines indicated by Mr. Bruty, contractors should find out three facts regarding the electrical position in their own area, i.e., population, units sold per head of population, and the price per unit. Tariffs, he thought, formed the one remaining obstacle standing between the public and the universal adoption of electrical energy.

Measured by the "yardstick" of population, units sold and tariff, Mr. J. Christie's recent defence of the flat rate system of charging at Brighton was soon seen to be indefensible. Mr. Christie had stated at the I.M.E.A. Convention at Torquay, that Brighton had abandoned two part tariffs 21 years ago in favour of a flat rate, and he claimed to trace a phenomenal increase in consumption during the last year or two to the existence of these simple rates of charge.

Digitized by Google

Looking up a few comparable places in the "Blue Book" Mr. Grierson said he had found the following significant figures:

Place.	Population.	Units sold approx.	Per head of population.
Brighton	168,000	23 535 000	140
Hampstead	86 000	17 487 000	202
Wimbledon	100 000	19 755 000	197
Chester (inner area only) ..	41 000	7 675 000	187
Bedford	40 000	15 800 000	394
Watford	52 580	16 500 000	315

Mr. Christie held that the financial results at Brighton justified the methods adopted, but his own view was that the success or otherwise of an undertaking could not be gauged entirely on financial results; the units sold per head of the population should also be taken into account. Electricity was not a luxury, but a public service which the public would have to have. Those standing in the way of its development would have to be brushed aside.

A Personal Experience.

Mr. Grierson quoted an instance in his own experience with a panel heating installation of some size. It represented a connected load of about 5 000 kW, the maximum load—a large number of thermostats being a feature of the system—being about 3 250 kW. This apparatus would have had a consumption of 1 750 kWh per kW installed, and the annual consumption, a good deal of which would occur during the night hours, was estimated at about 8 750 000 kWh. For this desirable proposition the supply authority concerned could quote nothing better than £5 per kW plus ¼d. per kWh for all consumption. The result was naturally the loss to the electrical industry of 3 250 kW of plant, and all that this entailed. Mr. Grierson thought that on a strictly competitive cost basis electricity for heating of the kind envisaged should cost not more than 0·18d. per kWh. This was not to say that nothing over that figure was practicable, but merely that the difference between it and the actual price in any particular case must be weighed against the luxury or convenience aspect. There were many current examples, as, for instance, in first class railway travelling, of people being prepared to pay for luxury service.

Mr. H. W. Roberts said Mr. Bruty had omitted to say that the great sin of the electrical industry in the past had been that it had concentrated on cheapness rather than on quality and service. Supply authorities had clamoured for cheaper wiring installations, and everyone else had replied by asking for cheaper units.

Naturally manufacturers would gladly receive suggestions from contractors, but as a manufacturer might have thousands of them as his customers it was a little difficult in practice to consult them all. One practical way of conveying suggestions lay through the British Engineering Standards Association.

Referring to Mr. Bruty's conclusion that we are still lacking a complete solution of the domestic hot water problem, Mr. Roberts said he felt that, however much we might dislike it, the registered plumber was a necessary help in this direction, and that it would be necessary to co-operate with him. As for the point about the design and construction of appliances that might be used with perfect safety, the manufacturers were also willing to produce anything for which there was a demand.

Mr. Bruty had stated that the remuneration offered by the electrical installation industry was poor. He thought this was because the contractors had neglected the counter trade. Quick turnover and counter trade provided the solution of this problem.

Mr. J. H. Asdell mentioned that there had been much criticism of the Electrical Development Association among the ranks of the contractors, and he appealed to such critics to help to strengthen its activities in every way possible. Similarly in matters connected with their own Association many contractors were too ready to leave others to do the constructive work for them. By giving active rather than merely lip service they would strengthen their own organisation and facilitate effective linking up with other bodies.

Mr. Ll. B. Atkinson regretted that Mr. Bruty should have thought it necessary to refer to an incident in which certain manufacturers were alleged to have played a somewhat unworthy part, but as it had been mentioned, and as the Cable Makers' Association was a party to some of the negotiations in that case, he thought it desirable that a statement should be made. The starting point, so far as the C.M.A. was concerned, was when the Irish Electricity Board appealed to the C.M.A. to organise a scheme and wire many thousands of houses in the Irish Free State within a few months. The C.M.A. replied that wiring was no business of theirs, and referred the Board to the N.E.C.T.A., who, in turn, said that contracting was no business of theirs, though they would be willing to help from the financial viewpoint. Then followed long and prolonged negotiations with a group of contractors who were interested in the scheme, but the C.M.A. took no part in these further negotiations. Eventually the C.M.A. was asked by the Irish Electricity Board to supply them with cables of a class not standard in this country, and consequently not suitable for the purpose for which they were required in Ireland. This the cable makers were averse to do, but eventually they agreed to supply a special cable without a guarantee of any kind, and with the proviso that if it were supplied, it must be available to any Irish contractor for use in connection with the new wiring schemes. Some of this cable was supplied, and then the questions Mr. Bruty had referred to were raised, and it was reported that no electrical contractors were being employed in connection with the scheme. He went over to Ireland, and on investigation found that the Board had, as alleged, decided to do their own wiring, and also that they were not willing to supply the special cable to contractors. In view of these circumstances, the C.M.A. decided to decline to supply any more of this class of cable. If they had acted in any way against the interests of the Irish contractors, it was quite unintentional.

Mr. B. Gill thought the most practical way to increase co-operation lay in local branch work. The organisation of small local committees on which supply authorities would be represented would lead to a fuller realisation of the difficulties of the installation industry and would facilitate progress along the lines of Mr. Bruty's paper. These committees could also do useful service in reporting cases of shoddy wiring to the proper authorities.

Mr. C. W. Sully, referring to the author's suggestion that manufacturers should consult the contractors, said he thought the president had given clear indication that the E.C.A. was in very close consultation with the E.L.M.A., and that during the past year they had obtained results which were considered more satisfactory than in any previous year. He agreed that such co-operation was necessary and desirable, but he must remind members that in endeavouring to co-operate with any other body they must exercise patience.

He shared the author's hope that the E.C.A. would represent the men of the retail side of the electrical industry, and so far as E.L.M.A. members were concerned this was recognised, though they hoped that before long it would represent the whole of the retail side.

Standard Voltages.

He was glad to hear the reference to standardisation of voltages, as the E.L.M.A. had this year taken a small but very definite step in this direction. While standardisation was important to the manufacturer, it was still more important to the distributor, for the greatest expense to-day was in the distribution of a product during its progress from factory to consumer.

Mr. Sully desired to stress the importance of Mr. Hazel's reference to the value of E.D.A. Circles. They were an ideal means for getting together all sections of the industry in a locality. The one unsatisfactory feature at the moment was that there were not sufficient Circles in existence. There were, at the most, about 100 Circles now in operation, but as the intention was that they should be very localised, there should be more like 700 Circles in this country.

Mr. Bruty, in a brief reply to the points raised in the discussion, regretted that Mr. Atkinson should have referred to the Irish cable case, as he had been careful to put his reference to it in the paper into very general terms. It was not realised in this country that the Irish contractors were faced with State-financed competition, and were not having a fair show. He could only say of the cable incident that he was not satisfied that any firm of standing should supply any cable without a guarantee. Much had been said in this country about the Irish preference for foreign goods. This was quite mistaken, and there was a keen desire, at least among the Irish contractors, for British material. It seemed curious that while in England the manufacturers and contractors seemed to live on the most cordial terms, those same manufacturers forgot their cordiality when dealing with contractors in the Irish Free State.

Mr. Roberts's short cut to wealth was interesting. In his own town, however, he had noticed that several of the people who had had shops and showrooms closed them and carried on just as well by letting the shop and carrying on upstairs.

THE CONTRACTOR'S PART IN RURAL ELECTRIFICATION.

Educating the Farmer—The Manufacturers' Position—Publicity Methods—Hire Purchase a Solution to the Problem.

By H. R. TAUNTON.

ON Friday morning Mr. H. R. Taunton read his paper on "The Contractor's Part in Rural Electrification." Electrical contractors, he said, were a not unimportant section of the electrical industry, and they had an essential part to play in its development, and they might reasonably hope to have their share of the benefits which would accrue to it if rural electrification came to its anticipated success.

To ensure their share, however, they must bestir themselves. They must not wait for the success of these first experiments. They must work with the rest of the industry to make them a success. As members of the general community, they should hope for the success of an enterprise which meant so much to the agricultural industry, still the most important in the commonwealth, even if to them personally it brought nothing. At the same time, as a section of the electrical industry, the industry on whose co-operation the Government relied for the practical working of the scheme, they had a special interest in it; and so, like the other sections of the industry, they might fairly look for a reward for their special labour.

One must at the moment admit ignorance of what rural electrification in Great Britain would eventually mean to all of us. Until we had definite data of the demand to cater for, plans could only be general, and organisation tentative. Meanwhile, we had no other guide but knowledge of similar schemes in other countries: in America, for instance, and in Sweden and Denmark. What had been achieved there might be repeated here; but we had to remember that conditions were different. In America farm holdings were enormous compared with the average in England, and were run on the lines of big business corporations. In Scandinavia the farmer had the benefit of highly organised co-operation, of which we had as yet only the beginnings. In both cases rural electrification had had the vast advantage of cheap supply from water power, distributed by methods more elastic and less costly than was advisable in so densely populated a country as ours. We could not be sure, therefore, that our demand would be large enough to ensure an economic success.

The whole question hinged on the probable demand, and in considering it we had to take account of several adverse factors. One of them was the intense conservatism of the small farmer. Anyone who had had experience of canvassing him for such modest instalments of rural electrification as lighting and pumping, would agree that the difficulty was not of making him see the advantages of them, but of persuading him to so definite a departure from the ways of his fathers. Talk of labour-saving usually made no appeal to him. He would admit it readily, and counter it by the argument that if the maid were not cleaning and filling oil lamps, or the labourer were not working the pump, they would simply be idling for part of the time for which they were paid a fixed amount.

Another objection was the initial expense. In days before the "grid," anything in the way of rural electrification meant a comparatively expensive generating plant. But the same objection would still have to be met in another form, for the success of the scheme depended on a large demand for power, with a corresponding initial outlay on equipment.

Mr. H. R. Taunton.

The question of initial expense had to be considered again from the supply authorities' point of view. The cost of an h.t. tapping was about £350, which meant that the authorities must recover £18 to £20 per annum from the consumer before they could write off the interest on the tapping, to say nothing of the service line. £18 to £20, on any reasonable tariff, was a fairly large consumption for a small farm up to, say, 200 acres.

We had to remember that its power conditions would be very different from those in a small factory. Much of the heavy work, such as threshing and ploughing, was only seasonal; and most of the smaller machines were only used intermittently during the day or the week.

The problems, in which contractors were interested, boiled down practically to two. One was, to educate the farmer and the country dweller to the advantages of electricity; and the other—more difficult—was to persuade him to the necessary outlay on it.

Taking the easier first, it was a problem with which contractors were as well able to deal as any other section of the industry; and their interest lay in dealing with it so energetically that the others would be content to leave it in their hands.

If, through any real or fancied neglect of theirs, the suppliers were disappointed of their expected load, they would be forced in their own defence to undertake their own canvassing. That meant their own selling organisation, and eventually their own installation department. Always the lethargy of the contractors had been made the excuse for similar developments in urban areas. There must not be afforded a shadow of an excuse for it in the rural areas; on the contrary they must so work that they not only secured their position there, but regained the lost ground in the towns. If contractors allowed the companies to get into the habit of doing their work in the country, they would carry the practice

Out for a stroll along the front during one of the "rest hours."

Digitized by Google

in the towns further than they do now, and ever further, until there would be no place left for the contractors.

So far as the suppliers were concerned, they could reasonably expect they would at least give the contractors an opportunity of doing all the hard preliminary work of securing customers for them, and while they did it to the suppliers' satisfaction, would leave to them the profit—or loss—on the installation contracts.

The Attitude of Manufacturers.

The case was otherwise with manufacturers. A maker of electric motors was not going to sit back and leave selling to an electrical contractor who might send what orders he secured to any of a score of competitors. And so with the makers of heating apparatus, and of fittings, and of lamps: each would want to fight for his own hand, and all at the expense of the contractor, who would soon find his profitable activities cut down to the bare wiring. However, the E.C.A. Trading Committee had waged a fairly successful fight against them in the past, and was doubtless fully alive to the dangerous possibilities in the future of rural electrification.

At the worst, if he found himself forced to meet such unfair competition, the contractor had certain initial advantages. To begin with, he had that of local knowledge, and he was always on the spot, as a manufacturer's travelling representative could not be.

As the important point was that what orders were going should go to some member of the contracting industry, rather than be split up among competing manufacturers and suppliers, it seemed to the author that the advertising and canvassing of local men should be supplemented by an organised sales effort on the part of the Electrical Contractors' Association, as their central body.

Mr. Taunton did not suggest a national newspaper advertising campaign, because funds would not allow of that being done on an effective scale; but they could prepare a range of pamphlets—on the lines of the B.E.D.A. publications, such as Mr. Riggs's E.D.A. 720—and of folders and leaflets, not merely proclaiming the advantages of ultra-violet rays for cows, but also stressing the importance of employing only responsible contractors, such as members of the E.C.A., on rural installation work. This literature could be either broadcast from headquarters or sold at cost to members, for overprinting and local distribution.

Another economical form of propaganda would be the equipment of an E.C.A stand at the many agricultural shows up and down the country. As dates rarely clashed, one equipment would serve a number of shows; and after the initial expense, the only other serious ones would be rent and salaries. An independent staff responsible only to headquarters would be necessary. If the staff were supplied by the local contractors, competition for a likely visitor to the stand of the Electrical Contractors' Association would probably savour more of "electrical" than of "association." Assuming impartiality in the attendants, visitors would simply be given a card with the names of local members, and it would not be difficult to devise a scheme, based on the production of the card, by which the member ultimately benefiting would pay some small commission to the E.C.A. towards the expenses of the stand. Apart from inquiries, stands at agricultural shows often paid for themselves by direct sales; and if such a selling policy were adopted, the proceeds, after a deduction towards the running costs, could be divided among local Association members.

A Demonstration Van.

A substitute for the stand, and one which could be usefully kept in commission all the year round, would be a travelling demonstration, in the shape of a van or lorry equipped with suitable apparatus, and with motors of various sizes, fed by trailing cables from a generator run off the car engine.

Here again, after the initial cost, the expenses of running one or more demonstration vans would not be so great that it might not be met, wholly or in large part, from income. A van might be either hired for a limited period by a particular contractor, who would then supply the demonstrators; or it might be worked, like the suggested show stand, on a co-operative basis, touring a district, either at the joint request of the local members, who would defray the expenses of the independent staff between them, or on the initiative of headquarters, as part of their national propaganda. In either case, any definite results, whether in direct sales or inquiries maturing into orders, could be dealt with on the lines already suggested for the show stand.

Assuming that by some such means the farmer had been so far interested that the only thing holding him back was the initial cost of the installation and motors and apparatus, hire-purchase was the key of the whole problem. Every day it was becoming more and more the financial basis of popular business and, judging by results, a sound basis—in spite of the arguments of the old thrift school. When anything and everything from a gas cooker to a country house could today be bought on the hire-purchase system, we could not expect any popular expansion of electrical equipment on a spot cash basis.

This presented to contractors as a body a grave and pressing problem. To supply companies and corporations with rates or Government loans at their command, and to manufacturing firms with large capital resources, the financing of a wide scheme of assisted wiring and hire-purchase of apparatus was a simple matter. It was very certain that unless contractors could follow their example and offer the farmer the same facilities, they would be shouldered to one side; and they could not reasonably complain. They could not expect suppliers to wait for consumers, and manufacturers for purchasers, until the farmers could pay for what contractors were unwilling or unable to give them without immediate payment. All they could hope for in that case—and not, the author thought, for long—would be the bare wiring at closely cut schedule rates.

Contractors had, unfortunately, to face peculiar difficulties in organising any scheme of hire-purchase. They were a strong and flourishing industry, it was true; but its individual members were, generally speaking, of small capital resources; small compared with those which were arrayed to take advantage of any failure on their part to meet the problem. The average contractor in rural areas, called upon to finance, on the slender resources of the capital not employed on his general contracts, an increasing number of fairly large installations, would soon find himself in such a position as to be unable to meet his current wages bill.

Without assistance of some sort, the hire-purchase inseparable from rural electrification was utterly beyond the capacity of 95% of E.C.A. members.

A Common Fund.

Their only hope, as a body, was in some scheme of co-operation, by which individual members would be assisted by a central organisation with a common fund. The E.C.A. was the obvious central organisation; the common fund was, unhappily, less obvious. Mr. Taunton suggested, however, that it was not beyond the wit of man, still less beyond the able wits of the Finance Committee, to devise means for the raising of an adequate fund. An issue of shares to members, or possibly to the general public, was a feasible solution; or, under certain conditions, a Government loan might be obtainable. The return on the capital would be in the shape of the interest charged to the purchaser for the accommodation, and the interest on the accumulation of instalments, on the lines familiar in building societies and other organisations financing general hire-purchase schemes. The security would be exceptionally good; and if the E.C.A., or the new finance company it would control, collected direct from the purchaser, little loss from bad debts need be feared. If it were found advisable to work the scheme entirely through the contractor concerned, no doubt suitable safeguards could be arranged to secure the same result.

So wide an extension of the Association's activities might, at first sight, seem alarming; but something like it, or some better alternative, must be quickly planned and quickly carried through if contractors were to take any serious part in rural electrification. The situation was novel and unprecedented, and called for novel and unprecedented measures; and since they were beyond the capacity of individual enterprise they could only be initiated and carried to success by joint action. In short, if contractors wanted to secure the farmer's orders they must offer him hire-purchase facilities; otherwise they must stand aside in favour of those who were ready to do both.

The author said he would like to see the E.C.A. prepare suitable wiring specifications for farm installations and work for acceptance not only by its own members, but by the authorities concerned. He did not propose to discuss the most suitable wiring system to use for that class of work.

In short, they must strive, not only to secure the farmer's order, but also, and as a means thereto, to secure and retain his confidence. Electrical contractors could and should play

Digitized by Google

a big part in rural electrification. They must let it also be a worthy part, and they need not fear that their virtues would not be modestly rewarded.

THE DISCUSSION.

Mr. W. RIGGS said the question of rural electrification should be considered under two headings, (a) as it affects the farmer, and (b) as concerning the villages and village industries. In cultivating the farmer they should find out his mentality in order properly to estimate his requirements. They must first rid themselves of the prevalent idea that the farmer was not a business man and was averse to taking advantage of up-to-date methods of working. The farmer's labour costs were enormous; they formed quite 75% of his total expenses. On the other hand, the prices he received for his produce were in most cases lower than before the war. He must therefore exercise the utmost economy in working, or go out of business.

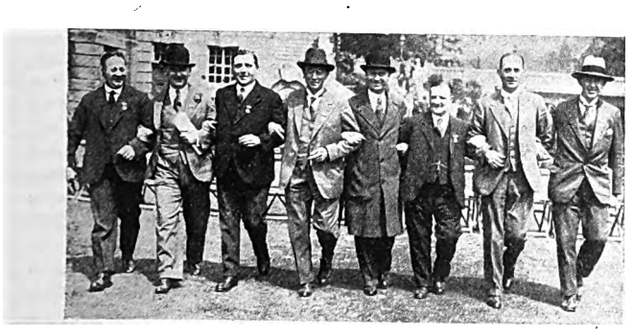
On the financial side, Mr. Taunton had suggested that hire-purchase was the only way in which business could be done in rural electrification. So far as the farmer was concerned it should be remembered that with farmers, as a rule, credit was neither asked nor given, and it was a rare thing for a farmer to owe anything on quarter day. If it were shown to him that it would be to his advantage to use a different type of machine he would somehow find the money.

To day there was hardly a farm without an engine of some sort. The barn was generally a workshop full of machinery, usually driven through a line of shafting by one engine. This was a very economical method, and electrical business could only result from our showing him a still better way. The electric motors which would replace the existing engines would provide a desirable load for the supply authorities, as some form of machinery was in fairly regular use.

Difficulties from the supply authorities' point of view should not be overlooked. The cost of tapping, even on low tension lines of 11 000 V and under, was no small matter unless there happened to be several farms situated near together. Usually our farmsteads were isolated in their own acreage, with the next farm rarely less than half a mile away.

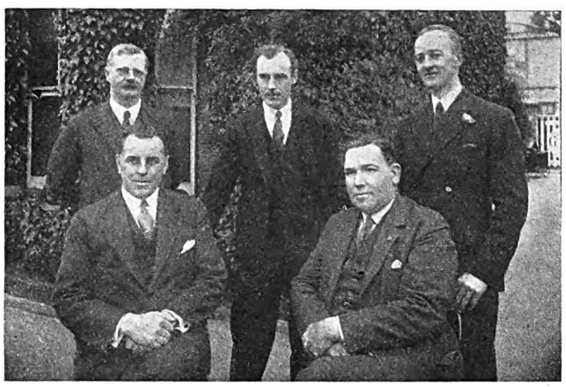
On the whole Mr. Riggs thought that, in spite of considerable difficulties, progress in rural electrification was possible in the near future. Long vision was needed, however, and supply authorities must not look for a profitable return at the outset. The country people had practical acquaintance with the benefits of radio, and the taste for electricity in the villages was already surprisingly well developed through the activities of the Women's Institutes and other organisations. Another advantage was that there was very rarely any competition from gas, so that there was here a virgin field for electrical contractors. The larger villages and hamlets should be tackled first, and the outlying farms and smaller villages next.

Mr. W. F. FURSE said he was glad to hear the author's reference to Mr. Riggs's farming paper, as this was an effort



Another group of contractors caught in playful mood.

which reflected great credit, not only on Mr. Riggs, but also on the E.C.A. Rural electrification provided a very big field for cultivation, but he feared that crops would not be very large at first. To go out for this business at present was an expensive proposition and would largely be a step in the dark. Contractors would have no sort of monopoly, and they certainly had no defined territory to work in. The possible activities of the kerbstoner further complicated the position. As showing how progress could be made without much capital expenditure Mr. Furse told of a country squire, who, at the instance of an electrical contractor, became interested in electrical possibilities. His house was lighted by a private plant, and when the time arrived for the replacing of his 200 Ah battery to be a matter of some urgency, the contractor showed him how he could save money by taking a public supply. The contractor approached the supply company, which was under statutory obligation to supply in the district, and explained how, by a slight diversion of its mains, it could pick up a useful load. This it was willing to do if a minimum revenue of £250 a year could be guaranteed. The squire's share was about £100, and he canvassed the neighbouring farmers and quickly made up the required sum. The church installation was paid for by a rummage sale, and the money for the installation for the manor house and most of the other tenants was obtained by an addition of 7% to the rents.



The local Committee of the E.C.A. (Bournemouth), showing in the back row, left to right: Messrs. S. T. Weggitt, H. H. Shears (local Secretary), H. S. Rogers (Chairman of Bournemouth Branch), and in the front row, Mr. A. R. Wilson (local Conference Secretary), and Mr. N. Aish (Conference Chairman).

In developing electricity in rural districts it seemed to him that the contractor's first move was to find out the obligations of the supply authority. The next thing was to get the biggest consumer, and work gradually down to the smaller ones.

Mr. H. T. YOUNG said that while the subject bristled with difficulties, most of which had been omitted by the author, he thought that such optimism was preferable to too much "safety first," a frame of mind which was getting dangerous for many people to-day. Having seen rural electrification in practice in many different countries of the world—even the Arabs had it—he had been led to inquire why we were backward here. He found that the conditions here were vastly different from those obtaining elsewhere, and the post-war necessity for re-settling large numbers of men on the land on small holdings had definitely held up rural electrical progress.

Even where there were villages to tackle he thought the best procedure was to begin with lighting and small domestic appliances, and gradually spread out into the farmyard, and then to the isolated farms and districts.

For the larger applications he did not think they would go far without use of the hire-purchase system, and this was a direction in which there was a possibility that the Government would take a hand.

With regard to the cost of current he thought too much insistence was placed upon the desirability of having a low unit price. In his view the convenience of the service was such that a little more on the unit was unimportant so long as people got a supply. The E.D.A. was doing extremely valuable work on agricultural development, and contractors would be well advised to co-operate closely in these activities. The farmer's wife was a very important factor in assisting electrical development, and the Electrical Association for Women could render valuable help in this direction.

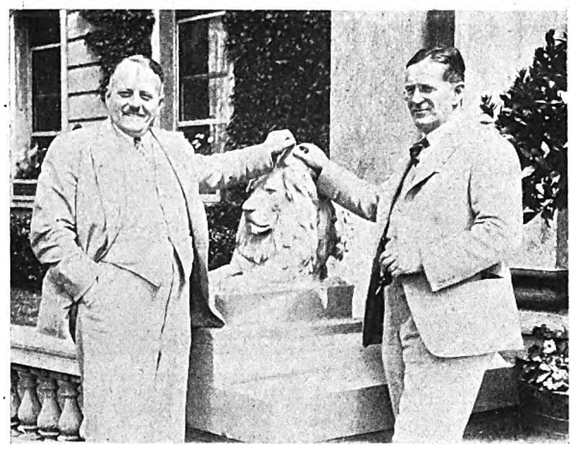
Mr. E. A. REYNOLDS spoke of the remarkable rural progress made in the area of the Shropshire, Worcestershire and Staffordshire Co. In its 2 000 sq. mile area it had in overhead lines 33 miles of 66 000 V, 27 miles of 33 000 V, 160 miles of 11 000 V, some 200 miles of low tension mains, and gave a bulk supply to several towns. Some 84 villages and hamlets were connected to the company's mains, so he thought they could claim that in this area at least rural electrification had definitely passed the experimental stage. Electric cookers were used in many of the villages, a large number of radiators was also used, and electric irons were almost universally employed. The load was quite up to the expectations of the company when the development was planned, and quite sufficient to justify considerable extensions each year.

The author's figures for the cost of tapping seemed unduly high. Some costs supplied by the S.W.S. Co. were: 50 kVA,

Digitized by Google

11 000 V, £155; 20 kVA, single-phase, £90; 10 kVA, single-phase, £65.

In cultivating the rural business he thought it highly important that contractors should have as representative a man who lived in the district and was well known and trusted by the country dwellers. Such a man would be in a much better position for business getting than any supply authority's representative, and could hold his own against any traveller. The greatest competition would come from local ironmongers, who often had sons who had dabbled in wireless and had acquired an unwarranted local reputation as men of science capable of dealing with all electrical matters. The



Messrs. A. B. Wishart and H. A. Lingard, both of the B.T.H. Co.

work done by such people was often appalling, and contractors should work to counter its results by pressing for recognition of the E.C.A. and the National Register. Members of these organisations should recognise the necessity of taking drastic action if one of their own members was found to have been responsible for unsound work. Such action deserved the fullest support of all who valued the reputation of the industry.

Valuable propaganda work was being done by the S.W.S. Co. They had a demonstration van and held exhibitions in conjunction with the local contractors in many of the towns and villages of the area. Last year they organised over 40 electrical exhibitions, some being held in village halls and others in a large portable marquee. These efforts were remarkably successful. The local contractors were always asked to co-operate, and the company did not sell any apparatus, all orders going to the contractors.

The company was now equipping a large scale experimental farm, where all rural applications of electricity could be seen by anyone who was interested. Here they would deal not only with power applications but also with intensive culture, light treatments for fungi, and insect pests. Attention would also be given to experiments on high tension discharges to the ground; anything appertaining to agricultural work in which electricity might be employed would be fully exploited.

The relations between the company and the contractors were on a very friendly basis. An assisted wiring scheme was worked by the contractors on behalf of the company, and a very active Electric Circle was in existence. Its meetings were always fully attended, some members travelling from 40 to 50 miles to attend meetings.

Mr. Ll. B. Atkinson congratulated Mr. Taunton and the E.C.A. on the selection of a very live topic. He agreed that at some stage, either sooner or later, hire or hire-purchase methods would be necessary. Whether or not the E.C.A. could usefully plunge into the complex financial arrangements which it would entail was not for him to decide, but however this was approached, it seemed to him that it would be necessary to deal separately with wiring and with the apparatus conected thereto. While the appliances could be taken away in the event of failure to pay the instalments, such a remedy was impossible in the case of a wiring installation. Most farmers nowadays were tenants, and satisfactory arrangements for wiring called for the consent of a third party, who would be regarded as the proprietor of the installation. With regard to the apparatus, one could follow the lines adopted in the furnishing and other trades—i.e., through special financing companies. Long experience of this class of business, both here and in the U.S.A., showed that the proportion of failures to pay was very low and could be represented by a fraction of 1 %. It had been proved as a sound business system in which there were few losses, and if the financing were carried out by those who had specialised in that business difficulties would be few.

Coming to instalment payments for the actual installations, Mr. Atkinson thought it desirable to arrange for the collection to be placed in the hands of the supply authority, for although it could not take the wiring out of a house, it could cut off the supply failing payment. He referred to the work of the Electricity Commissioners' committee which was investigating means whereby such schemes could best be carried out by the smaller undertakings without resources like those of the S.W.S. Co. Before very long a report would be published containing suggestions capable of application on a small scale.

Mr. F. H. Starling thought it would be helpful if supply authorities contemplating rural development would give early indication of their intentions to the E.C.A., so that local contractors might have early knowledge of forthcoming possibilities. While the financing of the business seemed a fairly easy matter, he foresaw difficulties if the supply authorities were asked to collect installation rents from farmers. In any case the actual wiring did not represent a large sum.

Mr. A. G. Bruty thought that as most Irish farms were small and there was but little tillage, the prospects for rural electrification there were not very promising. One aspect which appeared to have immediate possibilities was the electrical incubation of eggs. He had recently put in an installation in which there was an almost continuous incubation of about 15 000 eggs. This represented a good and constant load, and he thought there was a fair amount of work to be done in this direction.

Mr. H. Moss maintained that shoddy wiring was one of the greatest problems that would have to be dealt with in rural electrification, and the problem was how to prevent cycle dealers and garages from doing wiring work. Contractors in the towns and cities now had the greatest difficulty in coping with the jerry-wiring contractor, and he felt that the danger would be intensified in the rural areas unless some protective measures were developed to stop this blight on the industry. Compulsory registration of contractors would, in his opinion, be the only cure. It, therefore, behoved the E.C.A. to do its utmost to enrol every eligible contractor in the country on the National Register, with a view to getting Government recognition and closing the ranks of the electrical contracting business to all except duly qualified men.

Mr. Taunton's Reply.

Mr. H. R. Taunton, in his reply, said that Mr. Reynolds's account of the progress of the S.W.S. Co. was particularly interesting, and this achievement gave great promise of repetition elsewhere. It seemed, however, that in this case the supply company did most of the work. Mr. Reynolds was very lucky to have such a helpful supply undertaking, but such a happy relationship was not universal. In some places the supply authority allowed contractors to do wiring but sold appliances themselves. It was this sale of appliances that put the plums in the contractors' pudding, and if they had to rely on wiring alone they would not grow very fat. It was up to the contractors to persuade the public to come to them for their requirements, and once they had knowledge of rural districts that were about to be developed electrically the E.C.A. should start some central propaganda work. The speakers had discounted most of the difficulties in the way of rural electrification, and there seemed to be fairly general agreement that the contractors would be able to do the work with the aid of the finance companies. In this connection the E.C.A. already had a hire-purchase scheme which could doubtless be developed for the purpose.

METER AND INSTRUMENT SECTION, I.E.E.

As no nominations have been received from the general body of members of the Section to fill the vacancies which will occur on the Section Committee on September 30th, those members nominated by the committee are, under the Section's Rules, duly elected. The committee for 1929-30 will therefore be:—Chairman: Mr. E. W. Hill. Ordinary members of Committee: Messrs. W. E. C. Alliss, E. Fawssett, C. H. W. Gerhardi, A. J. Gibbons, J. T. Haynes, F. C. Knowles, C. W. Marshall, A. Middleton, E. H. Miller, William Phillips, G. F. Shotter, R. S. J. Spilsbury. A member of Council (to be selected by Section Committee); President, I.E.E. (*ex-officio*); chairman of the I.E.E. Papers Committee (*ex-officio*).

THE NATIONAL REGISTER.

Encouraging Steady Growth—The Annual Report of the Register—Tightening the Grip on Qualifications—How Cheap Work is Done—Tube Jobs Without Fittings.

By HARRY MOSS, A.M.I.E.E.

AS I sit and write this article I have in front of me a letter from one of my esteemed friends in the contracting trade, who is a real "Die-hard," and one who is very disappointed that compulsory registration has not yet become an accomplished fact. I do, however, think that he will begin to waver very soon.

He quotes the following couplet :—

> "Convince a man against his will,
> He's of the same opinion still."

And although this applies to him at the moment, he says "I am now encouraging Voluntary Registration."

To show that registration is getting the upper hand, I extract the following from a further document from his pen. "It has been said that 'A wise man occasionally changes his mind, but a fool never does.' If you are prepared to allow a slight transposition and make it "If a man changes his mind he is wise, but if he does not he is a fool,' then I claim that your Chairman has recently graduated from a fool to a wise man. For years I have strongly maintained, in season and out of season, that voluntary registration was no good, and not worth the paper the certificate was written on. At the risk of being considered inconsistent I wish to state here that my opinion has been considerably modified. I am still all out for compulsory registration of contractors, but I now realise that the voluntary register will have to form a nucleus of compulsory registration. We shall have to satisfy the powers that be that there are sufficient competent contractors in the country to allow fair competition and to safeguard the public from a few monopolists. This is not an original idea of mine, but has been very forcibly put to me by a number of better men than myself. Their studied opinion is that every member of the E.C.A. should register, and I have, perhaps very reluctantly, gradually, but surely, been compelled to admit they are right. I now look upon the voluntary register, not as to the end to which we are aiming, but rather as a means to achieve that end."

The man, whose thoughts are given in the above quotation, is a very much respected member of the E.C.A., and I trust his words will be taken note of and acted upon by all other members of the E.C.A. who have not yet enrolled on the register.

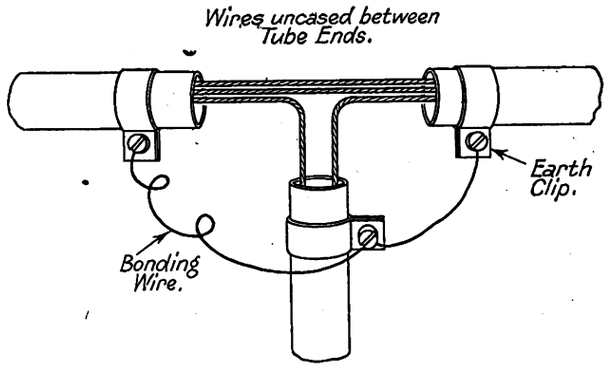
An Important Document.

The annual report of the Registration Authority recently issued was a document of intense interest, and one well worthy of perusal by all contractors, and if any of my readers have not yet read the report through very carefully I would ask them to do so. The general tightening up of qualifications and the insistence of the authority of certain wiring rules will do much to create a more favourable impression among those firms who are still outside the register. Personally, I should like to see an official request from the headquarters of the E.C.A. for all its members to enrol on the National Register immediately. A stronger register will be all for the good of our industry, and will, in due time, help us to overcome the unfair competition of the "shoddy" man and protect the public from the "incompetents."

A gentleman, well known as a maker's representative in the electrical trade, told me of a job he saw a few weeks ago, where a "screwed tube" job had been let for 17s. 6d. per joint, the lowest tender, and when the light had been put on in this bungalow he went inside the roof and found that beyond the ends of the rising tubes up the walls not a single fitting or piece of tube had been used in the roof, all the wires being run loose without any protection, and this was supposed to be done to an inquiry asking for a screwed conduit installation.

Another instance of cheap work recently heard of, and which has been connected to one of the large power company's mains, was a so-called conduit installation, but which had been carried out without any tees or bends under the floors or in the roof. The contractor responsible for this had, however, aimed to get an earthed system, inasmuch as he had bonded across tube ends as shown in sketch, with an earth wire and clips, but tube ends were not bushed and no tees used where branches were taken off.

As an instance of what the local plumber-electrician will do in carrying out a job, the following, which occurred in a small Yorkshire town a few weeks ago, is of interest. The house which was being fitted was about 150 yards from the plumber's shop, and it was being wired by a plumber on a



A "conduit installation," without tees or bends, designed as an "earthed system."

tube system. For several days the plumber was regularly seen walking down the street with a piece of tube in his hand, with his thumb tightly clenched at a certain point, and every time he was seen returning he was carrying two pieces of tube quite leisurely in one hand. After inquiries were made it was found that this plumber-electrician did not know how he could cut a piece of tube on the job, so took every piece down to his own shop to cut it at the bench, and then returned with the two pieces. One wonders how much this job cost the customer.

It is only reasonable to suppose that this sort of thing would not be tolerated if compulsory registration was put into operation, and the public would be protected against such incompetents.

The National Register is making headway. A voluntary register of the majority of the best electrical contractors, and the gradual education of the buying public through advertising, will, in the end, bring about that public feeling which will, in its turn, demand that compulsory registration of electrical contractors is the only safeguard against the hordes of "shoddy" wiring firms who are thrusting themselves on the unsuspecting public of to-day, and, I hope, will also lead to a further development, which will be the registration of electrical wiremen, so that the skilled operatives will be protected against those who have only a smattering of the knowledge that is required for the efficient carrying out of electrical installations that should be given to the consumers of the present day. Closer co-operation between all parties interested in the trade and a spirit of mutual help and protection will do much to hasten the long desired day. Personally, I see signs in the distance, and hope the clouds will be dispelled at no very distant date.

ILLUMINATION GLASSWARE AND CARRIERS.

THE B.S.S. No. 364-1929, for neck and flange dimensions of illumination glassware and carriers, which has just been issued by the B.E.S.A., ensures that the glassware and carriers shall be interchangeable. Dimensions are given for the necks and galleries for electric light fittings and for the flanges and supporting rings for bowl fittings. The diameter of the clearance hole in shades, reflectors or their appropriate galleries for the British standard bayonet lampholder is also included. These dimensions have been arrived at after due consideration of the dimensions of electric lamps and of the British standard bayonet lampholder, and for convenience of reference extracts from the appropriate B.S.S. Nos. 161 and 52 are given in appendices. Copies of the new specification No. 164-1929, may be obtained from the Publications Department, British Engineering Standards Association, 28, Victoria Street, London, S.W.1, price 2s. 2d., post free.

I.E.E. SUMMER MEETING.

Visit to Lannemezan Chemical Works—Four Sources of 20 000 kVA Supply.

(*Concluded from Vol. CII, page 784.*)

ON June 20th the party made a run by road through Bagnerès de Bigorre, through the foot-hills of the Pyrenees to Lannemezan. On the way some light deep-flange H steel posts were to be seen, supporting h.t. distribution lines in some cases, and with both h.t. and l.t. in others. At some points the l.t. was single-phase, but generally 3-phase circuits were visible. The sub-station points, which looked very neat, were supported on two steel H posts, each with a 3-phase transformer, fuses and surge-dispersers, made by Messrs. D. Soulé, of Bagnerès de Bigorre.

At Lannemezan the works of the Société des Produits Azotés (Nitrate Products) were visited. This company was founded to manufacture nitrogenous chemical manures, more especially calcium cyanamide; it has two works in France and one in Switzerland. The company has two power stations situated on the river Neste de Louron, at Loudenville and at Arreau respectively. Each of these stations contains two 4 000 kW generators, with step-up transformers to 60 000 V. This company, like other co-operating electro-chemical works in the water power group, operate their stations on to the network, and draw from it in accordance with a seasonal programme on special terms, handing over their surplus or taking surplus from others. The step-down station at the works is connected with the above power stations and with a further line feeding the step-up 60/150 kV transformer station of the Midi Railway, which is situated about a mile from the chemical works; this line is arranged so that the surplus from the Saint Lary power station of the Penarroya Mining and Metallurgical Company can be fed into the local co-operative system. A further line connects up with the Midi Company's sub-station. The works, therefore, have four sources of supply, each line having a capacity of 20 000 kVA. These lines can be put into parallel with one another when required, through the works sub-station, and switchgear telephone communication is made with neighbouring power stations by means of alternative telephone connecting lines. There are two groups of three single-phase transformers of a combined output of 20 000 kVA 60/12·5 kV; each group feeds eight furnaces, each of a capacity of 2 500 kVA; these two groups can be put into parallel, although to diminish the inconvenience which would arise if one furnace was short-circuited, the groups are usually kept separate. For the supply of current to the cyanamide and nitrate departments there are two transformers, each 3 000 kVA 60/12·5 kV. The apparatus at 60 and 12·5 kV is controlled by desk-type switch-operating panels with the aid of direct current opening and closing gear, the current being furnished by a battery of accumulators at 120 V. The transformers for the furnaces are of the single-phase type, 2 500 kVA each; they draw from the 12 500 V furnace-group busbars, and by alteration of tapping connections can supply at 85, 90, 95, 100, or 105 V; the transformers are placed close to the furnaces, each one supplying one furnace, the normal output being 25 000 A at 100 V. The furnaces are of the series type, with two electrodes each, operated by electric hoisting gear; they can be used to make ferro-silicon as an alternative to carbide if required. The smaller pair of transformers, each of 3 000 kVA, supplies power which is stepped down in 1 000 kVA units to 500 V to give current to motors of 375, 200 and 120 H.P. for driving air compressors, carbide and cyanamide breakers respectively. There are two 12 500/200-115 V transformers each, for operating pumps, cranes, travellers, breakers and machine tools; these are placed in a special sub-station. Two further sub-stations contain 12 500/200-115 V transformers; the first, of 100 kVA., supplies three 50 H.P. general water service centrifugal pumps, and the second, of 50 kVA, supplies light to a model colony for workmen.

The party rejoined the Midi Railway special train at Lannemezan Station, passing the 60/150 kV transformer station at which point the dispatcher of the Co-operative Power Company operates the power supply stations of the members.

After lunch the party arrived at Toulouse, and in the afternoon a new hydraulic testing weir belonging to the Toulouse Technical College was inspected. This is alongside a main weir on the river Gironde, close to a low-head water power station. Arrangements are made so that not merely can students study questions relating to water flow, but also detailed research work can be carried out. Later, the Toulouse technical school was visited. In the evening the party was received by the Mayor of Toulouse in the capitol (town hall), a modern building celebrated for its mural and ceiling decorations by local artists.

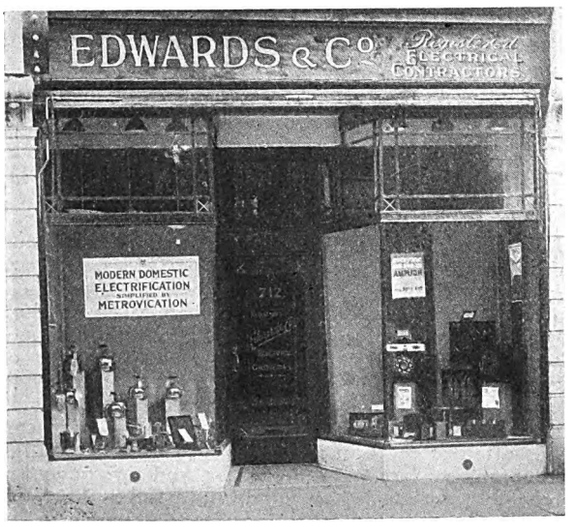
On the following day, June 21st, the town of Carcassonne was visited, a place noted for its wonderfully restored citadel; the town shows signs of building work and activities by Romans, Visigoths, Southern Gauls, Simon de Montfort, and others. Lunch was held at the Terminus Hotel, and a little presentation was made to Madame Bunet, the wife of the President of the Société Française des Electriciens, as a recognition of the efforts she had made with regard to the tour.

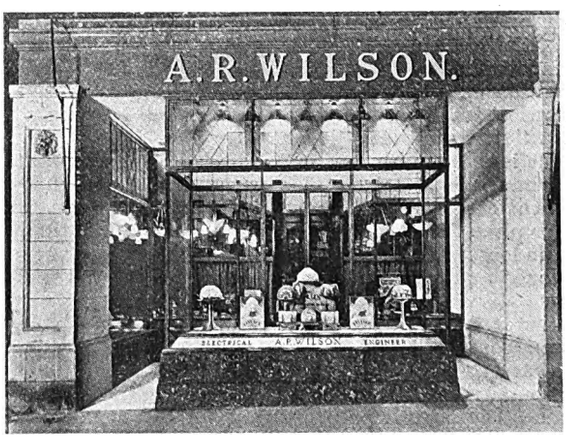
The party returned to Toulouse, and on the morning of Saturday, June 22nd, left for Paris and home.

Rural Supply in Bedford.

In regard to Bedford Corporation's scheme for the development of supply in rural areas near Bedford, the Development Commissioners recommend to the Treasury that, for a period not exceeding ten years, advances, free of interest, be made from the development fund to Bedford T.C. within a total of £6 000, of such sums as may be required to meet 75% of the actual annual deficits (if any) as certified by the Electricity Commissioners, on the working of the scheme; the repayment of advances from the development fund to be a first charge on the surpluses arising from the working of the scheme.

BOURNEMOUTH WINDOWS.





AMONGST the attractions at Bournemouth last week were the windows of the local electrical contractors. That of Messrs. Edwards & Co., is seen on the left, with that of Mr. A. R. Wilson on the right. Another Bournemouth window may be seen on page 23.

THE HIGH TENSION CONFERENCE.

The Use of Wood for Transmission Poles—Finnish Practice—The Calculation of Lines with Fixed and Chain Insulators—The B.E.A.M.A. and Overhead Transmission.

By THEODORE RICH, A.M.I.E.E.

(*Concluded from Vol. CII, page 781.*)

TOWERS AND CONSTRUCTION OF WOOD FOR LINES AT HIGH TENSION. By KARL STROMBURG, of Helsingfors, Finland.—The author described the use which has been made of wood with lines at 50 and 70 kV in Finland; most of the lines in that country at 35, 70 and 120 kV are made with steel supports. In 1920, during the financial crisis after the war, it was difficult to get firm offers for steel supports.

Finland itself has but little resources regarding iron and steel, such materials having to be imported, but it is very rich in wood and granite. The engineers of a power company, the Société Sydfinska Kraftaktiebolaget, designed supports not merely for normal runs, but also for long spans with high supports for crossing the Gulf of Perna. Fig. 1 shows a normal line support for 70 000 V put up in 1924. The main posts are 15 metres long (about 49 ft.) and about 8 in. diameter at the top; they rest on blocks of granite on solid ground and on timber frames covered with moss on wet bogs. The structure is cross-braced, and stayed on each side with wire stays with four-tons breaking strain; the cross-iron is of profile steel, well tarred. At angles the posts are stouter and extra stays are used; they are earthed and fixed to cement blocks, the posts are creosoted, and the tops of the posts are protected with plate metal. At a point about fifty miles from Helsingfors some long spans have to be tackled, in two cases across a navigable channel where the clearances in summer have to be 30 and 26 metres respectively. In winter, when the channels are blocked with ice, 8 metres is allowable. The construction used for some intermediate towers is shown in Fig. 2, counterweights being used to keep the tension to the amount desired. Fig. 3 shows a wood tower 46 metres high, for six conductors, 70 mm² and one earth wire, the maximum span being 522 metres. To make vertical joints a pole has its head driven into the bored out base of the one above it and bolted. The joints and cut ends are creosoted; the feet of the supports are on concrete foundations, the iron-work is tarred. Every three years the supports are inspected and covered with preservative.

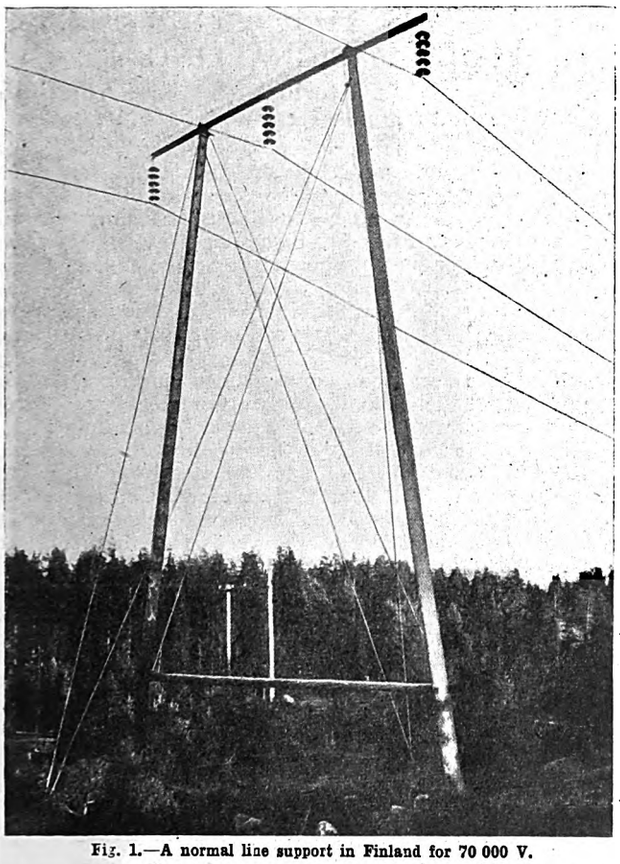

Fig. 1.—A normal line support in Finland for 70 000 V.

CALCULATION AND CONSTRUCTION OF LINES.—Senor SILVA, of Turin, contributed a study of the calculation of transmission lines with fixed and chain insulators, with special attention to supports at different levels and of cases where there is a breakage of a conductor on a line supported by chain insulators.

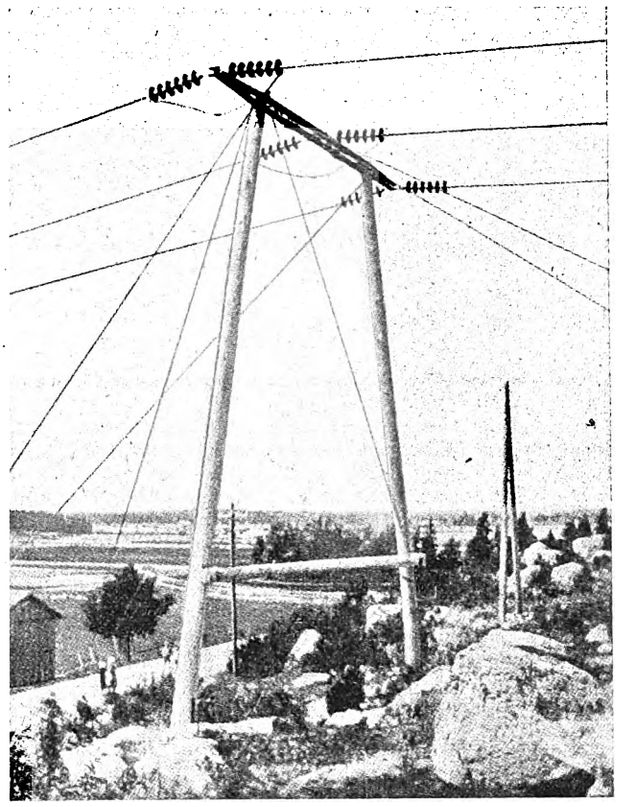

Fig. 2.—One of the intermediate towers used in Finland.

M. MATEESCU, of Bucharest, gave a report on the unification in different countries of the calculation of supports and conductors for overhead lines. He contended that the proper way to deal with the varying diameters under assumed atmospheric conditions was to calculate for the breaking strength with exceptional conditions, and not to use factors of safety with calculations that gave widely different stresses for conductors of different diameters. It is curious that in England and Sweden, both countries situated in Northern Europe, 50° C. (122° F.) is taken as the upper limit of temperature, whereas in Belgium, Germany, Russia, and Poland +40° C. (104° F.) is found to be sufficient. There are great variations regarding minimum temperatures. Switzerland and Germany have —20° C., without ice or wind, Austria —25° C., Poland —30° C., and Sweden —50° C., also without ice or wind. Norway has —25° and ice, Denmark —20° C. and a strong wind, Belgium —15° C. and moderate wind.

Factors are also given comparing wind pressures. The question of ice loadings is of interest. In Roumania experience shows that in that country ice is more likely to be found with a cold wind on the plains and in the form of soft adherent soft sleet in situations protected from wind. Some notes on ice thicknesses are given, and arguments regarding the chances of simultaneous ice and wind are discussed.

Messrs. W. B. WOODHOUSE and E. B. WEDMORE presented a report on the work of the B.E.A.M.A. on overhead lines, tests being based on the paper read before the Institution of Electrical Engineers on the same subject.

In the discussion on a group of reports, M. Van COWENBERGH pointed out that with chain insulators if a line breaks, then on swinging back the minimum distance to ground is materially lowered, and if the slip is taken into consideration, the matter may become very much worse. The question is,

Digitized by Google

should the towers be raised so as to keep within their rules under such circumstances. It was an important matter to keep costs within reasonable limits.

Senor SILVA said that on one occasion when crossing another power line with a line at 240 000 V, as a means to comply

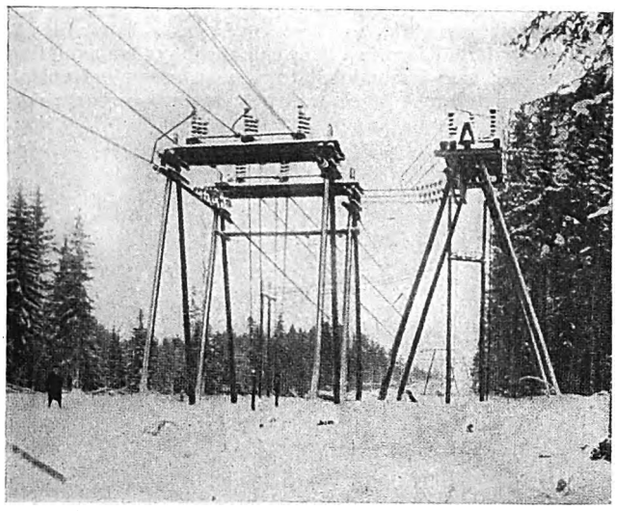

Fig. 3.—A wood tower for six conductors, with a maximum span of 522 metres.

with stipulations, he had arranged an extra insulated and suspension span to keep the line up should it break.

M. SULZBERGER (Switzerland) said that instead of stipulating a factor of safety, it was best to stipulate that after a certain point the strain should not exceed certain quantities for certain sections. Regarding strengths of post, the Postal and Telegraph Authorities had carried out tests on matters relating to pole strengths and foundations. It had not been found advantageous to couple poles. With all the artifices and bolts which had been tried, the results in strength were not nearly as much as those anticipated originally. It was a difficult matter to calculate the factor of safety of pole foundations.

Mr. WEDMORE said that further researches are taking place regarding the strength of foundations in clayey and sandy soil.

A provisional general report on the work of the Cables Commission was given by J. G. BELLAAR-SPRUYT. At the 1923 High Tension Conference Messrs. Smit Kleine, Proos and Van Staveren dealt with the dielectric loss tests of cables, and this paper with others resulted in a very animated discussion.

The 1925 Conference asked the Dutch National Committee to make an international inquiry on the subjects on the tests in vogue in different countries regarding high tension cables. In 1926 a circular was sent to the official delegates of the 1925 Conference concerning current tests and proposed modifications. Among the new methods proposed were the examination of dielectric losses as customary in Holland; the raising of the test voltages; an examination under continuous current at a multiple of the normal pressure, and the determination of the curve of duration before puncture was suggested by Signor Soleri. The replies coming from fifteen countries showed that, in general, existing tests were considered to be insufficient, most authorities considering that it would be best to combine the loss test with that of the duration for puncture.

At the 1927 Congress it was decided to have a Commission on the subject, and thirty-seven gentlemen agreed to take part, coming from a number of countries, Mr. B. L. Goodlet (of the Metropolitan-Vickers Electrical Co.), Mr. L. C. Grant (of Messrs. Merz and Maclellan), and Mr. T. N. Riley (of Standard Telephones and Cables Ltd.) being British members of such Commission.

A small preparatory committee was first nominated. A sessional meeting took place in January, 1928, at which time M. Van Staveren gave particulars of investigations carried out by the Association of Directors of Power Enterprises in Holland during 1927. Some of the cables forming subject-matter referred to in the report were some that had given trouble in service, although they had been able to support tests of triple voltage for a quarter of an hour. It was precisely the insufficiency of the tension tests which had led the Dutch Association to develop the system of dielectric losses tests; not only had those which had given trouble given evidence of ionisation, but those which had been satisfactory had given no evidence of ionisation, thus showing the value of such tests.

TENSION TESTS.—The international prescriptions in this direction commenced by a project of M. Van Staveren, making the tension test 2·5 times the service tension for a quarter of an hour; for each method of connection this value being proposed to cover the over tensions of two to three times normal with neutral earthed and three to four times this value without earthing. The preparatory committee declared itself in accord with this starting with 10 000 V, below this value the proportion being raised in accordance with the proposals of Signor Soleri.

DIELECTRIC LOSS TESTS.—There were variations of opinion on the subject of loss tests, but, as proposed to the I.E.C. by the Italian National Committee, it was decided to use only two tensions corresponding to a potential gradient of 800 and 4 000 V per mm thickness; although M. Delon proposed a test on a short length of cable, during a long time, for example, fifty hours, and also at a high tension of, say, three times normal.

Experiences in Holland showed that the behaviour at higher tensions did not give a satisfactory indication of service value, that is why the dielectric losses tests as a function of tension and temperature were proposed. The question of puncture tests as related to the test time was discussed, but the matter is still under consideration.

Regarding bending tests, five times normal voltage for two minutes was proposed, the length of the sample and the temperature during test was discussed; the question of capacity and insulation resistance tests at low tension was looked into, tests made by the Dutch Electrical Managers' Association showed that above 45° C. (113° F.) the dielectric properties of cables change. The activities of the preparatory committee of the International Cables Commission are still concentrated on arriving at a satisfactory conclusion

RAILWAY SIGNALLING.

Discussion at I.E.E. Informal Meeting—Abolition of Manual Signals Retarded by Cost.

AT the final informal meeting of a session notable for excellent attendances and discussions upon a very wide range of subjects, held at the Institution of Electrical Engineers, Mr. M. G. Tweedie opened a discussion on "Power Supply and Railway Electrical Signalling."

Mr. TWEEDIE confined his remarks to the control of the movements of steam trains on the main lines, for there the problems were peculiar and formidable; on electric railways there was unlimited current and transmission presented no difficulty.

He exhibited a number of lantern slides showing diagrams of connections of the elaborate relays, signal locks and lamps which have the responsibility of directing or holding trains. This vital apparatus must be of the finest quality and reliability, and it was the cost of this apparatus, together with that of the connections and transmission wiring which retarded the abolition of manual signalling. The current required for signalling services was very small, was not an important load for a supply authority, and the cost of transmitting current to the site was often more than the cost of wet cells, though these occasionally amounted to 1 000 Ah or more at 6 V.

In the discussion Mr. G. H. CROOK said the principle and practice of electric signalling was established and he looked forward to the time when supply would be more general, so that its use where wanted would be less expensive.

Mr. W. E. LANG observed that the signalling load was inconsiderable, while the cost of the apparatus was high. That railways have adopted electric signalling must have the justification of efficiency or ease of maintenance.

Mr. A. MORGAN pointed out that the fundamental principle of railway signalling was that a failure of the controls produced a stop warning and means safety. With industrial apparatus the push button and ordinary control gear was on the opposing principle and was surely wrong. He felt that the relative immunity of Britain from railway accidents had retarded the adoption of electric signalling because the cost factor operated.

Messrs. J. Coxon, W. A. Erlebach, H. W. Gregory, S. B. Jackson, E. S. Ritter, J. F. Shipley and W. L. Wreford also spoke.

BONAR LAW MEMORIAL.

Interesting Equipment at Training College of Conservative Party.

THE property at Ashridge, presented last year to the Conservative Party by the late Mr. U. H. Broughton, M.P., to be used as a training college, has been converted by Messrs. Trollopes under the direction of the architect, Mr. Clough Williams-Ellis, and the electrical work, with which we are mainly concerned, was designed and carried out by Messrs. TYLER AND FREEMAN, of 40, Chancery Lane, London, W.C.2.

The supply is taken from the Chesham Supply Co., whose 6 000 V mains are brought into a special sub-station in the outbuildings, where 200 kVA three-phase transformers have been fixed, with suitable h.t. switchgear. A loop main has been brought in, so that eventually the supply can be taken from either side of the ring main. The internal distribution is at 230/400 V, 3 phase, the neutral point being earthed in the sub-station. On the l.t. side each transformer is controlled by a 300 A t.p. isolating switch of Johnson and Phillips' make, arranged so that the transformers can be run in parallel if desired. Although the connected load is nearly 400 kW it is not expected that the actual load will exceed 200 kW, and normally only one transformer will be in use. Connections run from the isolating switches to the meters and on to a 500 A t.p. main circuit breaker to control the entire installation with overload, no voltage and leakage trips and leakage indicator. This also is of Messrs. Johnson and Phillips' make, of their standard oil immersed pedestal type. The main distribution board is of Messrs. Parmiter, Hope and Sugden's make, of standard iron-clad unit construction. Three-phase circuits are run to the house for the lighting, cooking and heating loads, and d.p. circuits run to supply the local lighting and power and heating loads in the adjacent cottages, laundry, garages, etc. All these outgoing cables are 2, 3 or 4 core paper insulated, lead covered and armoured, of Henley's make, and range in size from 37/·072 downwards. In the house three main distribution points have been arranged for lighting, heating and cooking respectively. At each the 3-phase supply is divided up into 3 d.p. systems, each controlled by a main switch and main fuse board, with sub-mains and sub-fuse boards as required to suit the varying loads. All these main switches and boards are of William White make, of their standard ironclad H.O. type. The main cables are run in screwed tubing with 600 megohm C.M.A. cable, but from the boards most of the circuit wiring is Henley lead-covered.

The lighting installation provides for about 800 lamps, and there is an extensive system of two-way and intermediate switch control necessary, due to the various separate staircases and connecting corridors. The special fittings made up largely to designs of the architect have been supplied by Messrs. Gillman and Jones. The whole of the cooking (except a small reserve coal range in the house and two small coal ranges in cottages) is carried out electrically, the apparatus being of the General Electric Co.'s manufacture. The main kitchen equipment includes a large 4-oven island range; a 2-unit grill; a 2-unit fish fryer; a 2-oven pastry cooker; an 8-plate boiling table and various large tea urns, water boilers, etc. There is also an extensive range of auxiliary apparatus supplied mainly by the Washing-up Machine Co.

Heating points are also wired in most of the principal rooms, and a large number of electric fires of various sizes and types have been fixed. These also are of G.E.C. make. The main heating installation, carried out by Messrs. Beaven and Co., is oil fired, and the entire automatic control of this is electrically operated. The laundry has been equipped by Messrs. Manlove, Alliott and Co. An automatic telephone system has been installed. The exchange instruments were supplied by the Relay Automatic Telephone Co. Gillett and Johnston electric clocks and a mains operated Metro-Vick wireless installation, with an Amplion loud speaker, are also comprised in the equipment.

THESE pictures show the equipment installed at Ashridge House, by Messrs. Tyler & Freeman. The two top photographs show part of the main wiring and switchgear, whilst the lower views are of the kitchen, showing (left), the 4-oven island range, alongside the old-fashioned spit, and (right), the boiling table, fish fryer and double grill.

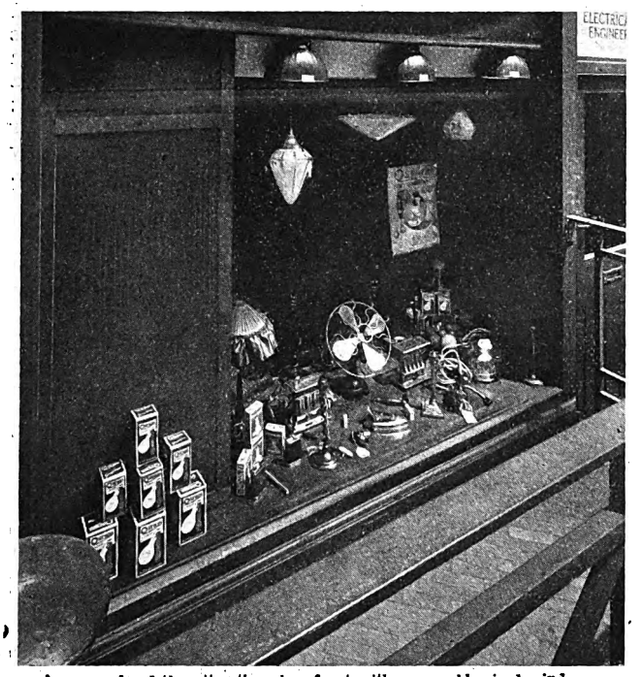
THE SHOP-FRONT AS AN AID TO INCREASED TRADE.

Points Specially Studied from the Aspect of Supply Authorities and Electrical Contractors—Opportunities in New Building Areas—The Employment of Specialists—Shop Fronts and Their Surroundings.

By A. EDWARD HAMMOND (Author of "Shopfitting and Display" and "Practical Aids to Retail Selling").

MANY electrical contractors adopt a policy of *laissez-faire* in regard to their shop-fronts. Their business provides them with a living—perhaps an indifferent, or possibly a very "comfortable" one. They are well known in the district, probably actively interested in local affairs. They give good service, and sell just the class of electrical fittings that the local people seem to want. What more could they ask for?



An example of the attractive shop front with reasonably-sized windows. (Mr. Alfred F. Roffey).

A new shop-front would, of course, be very nice if they could afford it; but, in present circumstances, it would be a luxury beyond their needs. Besides a new shop-front, however striking and attractive, would not bring more trade if it were not there to be brought. The man with a small lock-up shop, either in a populous thoroughfare or in a side street, who has no local reputation upon which to rely, takes up an equally sceptical viewpoint; but an inspection of his windows, in which the same dust-covered shades and fittings appear sometimes for a month on end, gives one the impression that it is more through indifference than from a studied policy on the matter that he neglects the appearance of his shop exterior.

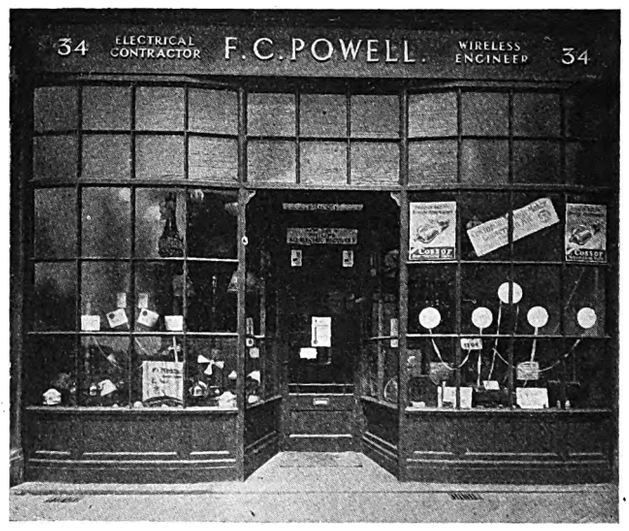
Thus these good people argue. Some contractors, while realising the shortcomings of their present premises, plead an inability to effect any improvements, on financial or other grounds. For them half-way measures may have to suffice, but that is better than doing nothing. Others regard their inconveniently arranged shop-front, with its small windows and its two steps leading up into a narrow doorway, as a definite factor in attracting trade. They point out that local people are used to it, and would not like to see a change because it would break one of the old associations of the district. Perhaps they take the local residents' affection too much for granted.

Now it must be admitted that there are shops with a definitely old-style atmosphere which forms a part of the sales policy of the business. People—and particularly visitors—do visit them because of, and not in spite of, the fact that they are old-fashioned; but these shops must have a character of their own, which will enable them to withstand the competition of the new and essentially modern premises which spring up around them, and the electrical contractor must not overlook the fact that many premises which are visited because of their antiquity are kept in a perfect state of repair, a process which often costs more than the straight-forward scrapping and modernisation method, for the renovation of ancient buildings is a specialised work to which experts have devoted considerable attention during the last year or so.

One realises that there are many influencing factors which attract customers besides the shop-front and window display. It will not be necessary to emphasise to small contractors the advantages in the shape of modern premises which many local electricity supply undertakings can offer—improved facilities for customers and so on; but the fact remains that those large concerns which are drawing customers by the aid of improved service are, almost without exception, employing modern shop-fronts. They realise that even the customers who are anxious to save a few shillings, or a few pence, as the case may be, generally exercise a certain amount of discrimination as to the nature of the surroundings in which they make their purchases.

The small contractor who feels disposed to clasp his hands and say: "What's the use?" might well look to his own shop exterior to see if he is doing his utmost to impress passers-by with the attractiveness of the retail side of his premises. There are ways and means of brightening a shop exterior without necessarily going to the expense of an entirely new frontage. If the fascia is of the out-of-date glass-fronted, incised variety, the whole shop-front might be smartened up by its replacement with one of the neat opal glass name-plates, with bronze or dark oak lettering. If the window has a straight run of plate glass from stall-riser to fascia, the contractor would considerably improve its appearance by the introduction of an imitation transome in the form of a strip of the specially glazed paper which so realistically represents leaded lights, or, alternately, by employing a fairly deep pelmet.

There are still many electrical contractors in a small way of business who seem to think that the renovation of the shop-front or the erection of a new one, is merely a job for the local decorator; but a close study of the needs of the one-man business has been made by many of the firms specialising in shop design, and the small contractor, no less than his bigger competitors, has ample opportunity for consulting the specialist as to the most economic and attractive treatment for his shop-front.



The bow-fronted, square-paned windows of Mr. F. C. Powell.

The tremendous building activities, and the rapid growth of the residential districts has brought about an increase in the need for electrical supplies, and, in spite of the activities of the local electrical authorities, it is interesting to note that the number of contractors with small shops continues to increase in many districts.

"Competition is good for trade," is a truism to which, applied in moderation, there is no exception even in the electrical trade, and the practice of the electrical authorities

Digitized by Google

in employing specialists to design and erect their shop premises should have the effect of waking up many of their smaller contemporaries to the possibilities of, or, rather, the necessity for, keeping their premises both up-to-date and attractive in appearance.

One difference between employing a specialist on the job and in calling in a builder and decorator who carries on shop-fitting as a side-line is that the specialist, by long training and experience, has an intuitive knowledge of the value of space. He will probably take longer in measuring up and planning, but the result will reveal the skill which has been applied in avoiding unnecessary angles and corners, and in ensuring that the maximum amount of room is available for display purposes.

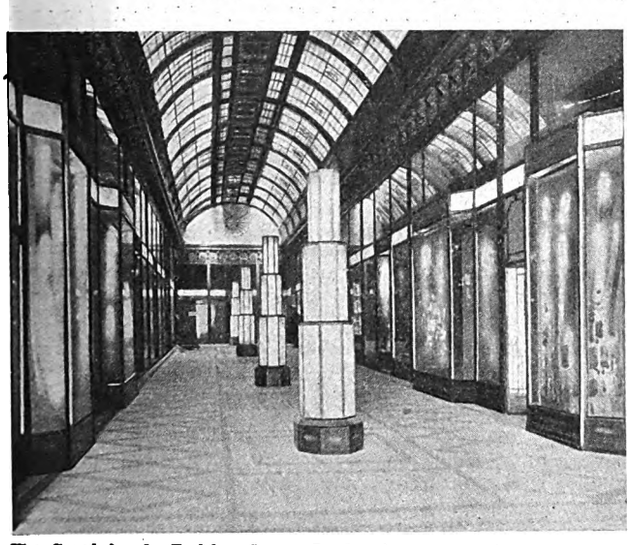
The architect is becoming more and more a vital factor in shop-front design and construction, and it is essential that he should work in close touch with the shopfitters, the metalwork producers, and the ventilating and flooring specialists. The construction of a modern shop calls, indeed, for the employment of specialists in all directions, but, fortunately for the contractor, he is not under the painful necessity of consulting each of them in turn. It is for the shopfitter to carry out this part of the business.

Although it should blend with its surroundings, it is not always advisable that the shop-front should be erected on lines which show a too close adhesion to the design of the remaining parts of the façade, especially if a bold, wide architrave is employed with pilasters in the same material, and in similar proportions. Such a treatment enables the shop-front itself to be carried out on modern lines, more or less corresponding to the building to which it is attached, without necessarily conforming to the architectural style and design in all its details.

A shop-front to be successful to-day must be entirely in keeping with its surroundings. The cathedral city hardly calls for modernist façades, nor is the period frontage generally suited to a shop in juxtaposition to entirely or even partially modern buildings.

In certain districts neither the modernist nor the period shop-front would harmonise with its environment. In a side street away from a shopping centre, or in a run of shops surrounded by stereotyped villas, a medium type of shop-front architecture, with no outstanding characteristics in design, would generally be more in keeping with immediate surrounding buildings.

At the present time public interest is being aroused in the efforts of bodies which aim at the preservation of both historical architecture and rural beauty to check the growth of inharmonious building, and to control outdoor advertising

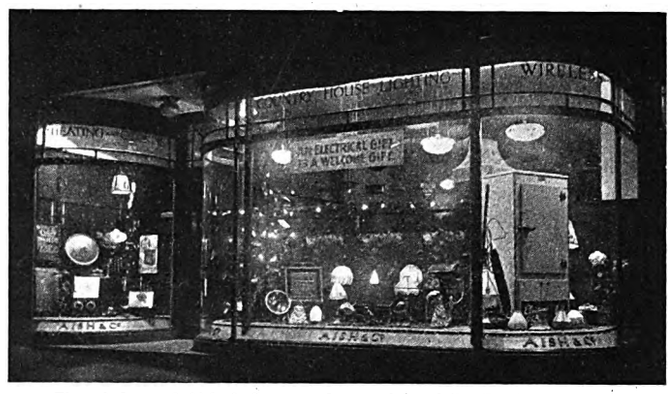


The Grand Arcade, Trafalgar Square, London, is a permanent advertisement of the value of light.

and commercial developments in the æsthetic interests of the nation as a whole.

Shop-fronts have received their share of criticism as well as posters and petrol pumps; but the electrical contractor is fortunately in a position to remedy the situation by placing his shop construction and renovation in the hands of specialists whose object it is to produce worthy exteriors for retail premises.

Arcades are becoming increasingly popular in shopping centres. Such sites provide many advantages for the electrical contractor, not only from the point of view of prominent position, but also in that, being well lighted, they give him excellent facilities for display. Both the new arcade in the municipal buildings at Nottingham and the Grand Arcade, Trafalgar Square, London, are permanent advertisements of the value of light, and would enable the electrical contractor who opened a shop in such surroundings to practise what he preached by showing his sales articles under the most modern lighting conditions.



The windows of Aish & Co., seen by members of the E.C.A. Conference during their stay in Bournemouth.

Light forms a prominent feature of the decorative part of both these arcades. In the Grand Arcade in London, a series of "Pillars of Light" occupy prominent central positions for the full length of the arcade. Both these and the illuminated surrounds of the shop-fronts are of translucent glass panelling lighted from the back. The effect of the lighting, however, is slightly marred by the fact that the actual sources of the light can be seen through the glass. A slightly thicker or more obscured glass would probably have prevented this and produced a softer illumination.

The new shopping way in Nottingham is "T" shaped in form, of ample width and unusually lofty dimensions; the barrel roofs are 60 ft. high, and at their intersection form the main dome feature, with an inner dome rising 90 feet above the pavement. This arcade contains on either side a series of high-class shops, which are faced in Bath stone with black marble bases, the shop-fronts being skilfully treated in bronze.

The illumination of the shops, the designing of which is left in the hands of their respective tenants, will supplement the arrangement of floodlighting by sixty-eight reflectors concealed behind the tall Greek vases arranged on each side of the arcade along the projecting masonry above the shop fascias. These reflectors are intentionally fitted with lamps of only a moderate wattage, in order to give a more subdued tone, thereby obviating any suggestion of competition with the necessarily greater degree of brilliancy required in the lighting of the shop windows.

Two interesting examples of contractors' shop-fronts are shown among the accompanying illustrations. That of Mr. Alfred F. Roffey (268, Vauxhall Bridge Road, London, S.W.1) is an excellent demonstration of how an attractive shop-front with a reasonably-sized window may be constructed on a building not originally intended for trade purposes. The shop entrance and the display window are partially below the level of the pavement, yet everything in the window can be seen clearly by passers-by. The window itself has an essentially up-to-date setting, comprising panelled backgrounds and a parquetry base, and the displays arranged in this window with its quaint green shop-front and green railings in front might be taken as an example by many contractors with larger and more conveniently built premises.

The shop-front of Mr. F. C. Powell (34, Church Road, London, S.E. 19), is a relatively new one, and has several old-style characteristics which give it a certain touch of intimacy not unsuitable for premises in which electrical household equipment is sold.

The windows are bow-fronted, and, instead of the usual unrelieved expanse of plate-glass, are divided into square panes set in wooden frames. The whole front is in wood with a grained finish. The lettering on the fascia is of gilt shaded red, and the section above the transome rail is glazed in semi-transparent fluted glass.

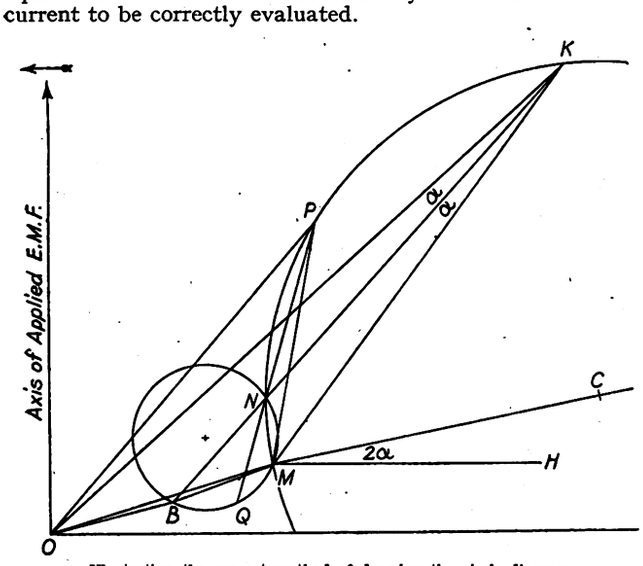
THE CIRCLE DIAGRAM OF THE INDUCTION MOTOR.

An Improved Graphical Proof of the Circle Diagram of Polyphase Induction Motors—A Simple Description of the Method Used—Motors Operating with Phase Advancers.

By LAURENCE H. A. CARR, M.Sc.Tech., M.I.E.E.

AN improved graphical proof of the circle diagram of the polyphase induction motor has recently been published by the author ("Journal I.E.E.", Vol. 66, p. 1174, November, 1928), its principal feature being that it enables the rotor equivalent current line to be correctly drawn and the rotor current to be correctly evaluated.



Illustrating the correct method of drawing the circle diagram.

It is therefore thought that a simple description of the method, omitting the somewhat lengthy proofs, will be of service to many of those who wish to use this correct method of drawing the diagram.

The proof states that if OM and OK be the magnetisation and short circuit currents respectively, there is a vector OB giving the magnetising current at short circuit, *i.e.*, the component of OK driving flux across the air gap at short circuit, which is of the order of half OM, and a vector BK the rotor equivalent current at short circuit.

The values of OB and BK may be determined by symbolic calculation if all the constants of the motor be known, but if not, as is usually the case when dealing with test results where only OM and OK are known, the point B may be found by bisecting the angle OKM and cutting off the length $BK = \sqrt{OK.\ MK}$.

Although this method is only approximate, the position of the point B found in this manner is usually almost indistinguishable from its position if determined by the full symbolic method.

The centre of the circle C, lies on a line MC, making an angle CMH with the horizontal MH, which is equal to the angle OKM.

Alternatively, the old rule of bisecting the vertical intercept between the point M and the line OK, and using the bisecting line as the horizontal axis of the circle, may be used, since it gives identically the same result.

If then any point P be selected on the circle with stator current OP, the rotor equivalent current is not MP, an approximation made by some writers, but is a line QP, which bears exactly the same relation to MP both for direction and magnitude as BK does to MK.

Hence, in order to determine rotor equivalent currents, it is only necessary to measure MP and to multiply this value by the ratio BK/MK.

It may be noted that with low values of short circuit power factor, the ratio BK/MK is approximately equal to

$$(OK - OM/2) \ / \ (OK - OM)$$

while if the short circuit power factor is higher than, say, 0·25 the same equation may again be used as an approximation, provided that the subtraction is done vectorially.

The line QP, therefore, need not be drawn for its value to be determined, but if a series of lines QP be drawn for information it is found that they have the two following properties:

(i) All lines QP (or QP produced) cut the circle in the same point N, which is the point where BK cuts the circle, and which also forms one end of the horizontal diameter of the circle.

(ii) The locus of the point Q is the circle which passes through N, M and B, in which the arc MQB is found to be similar to the arc MPK on the main circle.

The principal other point which arises from the proof quoted is that for any stator current OP the equivalent slip ring voltage at standstill is KP, where KB is the slip ring voltage calculated from the transformation ratio corresponding to the numbers of turns, winding factors, etc.

This enables starter volts to be correctly determined, while inherent in the above statement is also the fact that with open circuited rotor the slip ring voltage measured will be KM/KB times the theoretical "transformation ratio" voltage.

It also follows from the proof that where the point P is not on the circle, as for instance, in the case of a motor operating with phase advancer, the same law with regard to rotor current is true, that is to say, the rotor equivalent current is still BK/MK times the line MP.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

The Menace of the Amateur.

[To the Editor.]

SIR,—Your correspondent "Experto Crede" pays me a compliment in your issue of June 21st in reference to my efforts for "the elimination of the unfit in contracting," but, in his opinion, not enough attention has been given to what he terms "the menace of the amateur."

First of all, let me say how much I welcome the contribution of "Experto Crede," because it is a direct and valuable help to my efforts in connection with "the need for compulsory registration," "the elimination of the unfit in contracting," etc., etc., that I have been writing about in your columns for some considerable time.

Several of the photographs that have illustrated my articles have been of work carried out by amateurs, although the majority of them are of work executed by so-called electrical engineers.

I have pointed out the terrific risks that will be run, when the "grid" gets in operation, if wiring work is going to be carried out by anyone who cares to style himself an electrical engineer, irrespective of his qualifications, training, etc.

If "Experto Crede" has read all my articles and studied all the photographs illustrating same, he should have seen how I have repeatedly pointed out the dangers that exist when house wiring or any other wiring is carried out by the "amateur," "kerbstoner," and all other such incompetents, posing as electrical contractors and electrical engineers.

I am convinced that it ought to be a punishable crime for anyone to style or call himself an "electrical engineer" who has not got the necessary qualifications, as this class of person is an imposter of the worst kind.

I fully realise that the "menace of the amateur" is real, and I have realised this for some time, just as much as I realise that the unfair competition of the "kerbstoner" and other incompetents is real.

Having, however, realised these dangers, what are *we* to do about the matter? Under existing conditions at the present time, we, as contractors, cannot do much as an individual organisation, but with a National Register fully representative of *all* the best that exists in the contracting section of the industry, can do a great deal.

Nor is this all, as I am more convinced than ever that a more representative register will receive the hearty co-operation of other sections of the industry and particularly the supply and manufacturing sections.

"Call in an electrician" is not a proper slogan to use at the present time, for the simple reason that thousands of

Digitized by Google

nincompoops are posing as and calling themselves electricians, who have no right to such a name or title.

If the name I coined some time ago in connection with the competition in your paper, and for which competition, by the way, I won the prize, was adopted, and the name "Registrician" be registered and only allowed to be used by registered electrical contractors, then the slogan "Call in a Registrician," would be of some value.

This is where safeguarding would come in, and goodness knows, we in the contracting trade want some measure of safeguarding, either by means of a protectionist name such as I have mentioned, or a government measure to confine electrical wiring work to those firms who are recognised members of such an organisation as the E.C.A., or are members of the National Register.

The sooner the "trade" is protected, the sooner will the public be protected against "the menace of the amateur," against "the danger of the unfit in the contracting business," and in general against all the incompetents and imposters that are a blight and a positive danger in the electrical world of to-day.

One further word, "Experto Crede," let me have your help —don't let your pen go rusty. I am "all out" for anything and everything that will protect our section of the industry, because I fully realise that a healthier contracting section will be beneficial, not only to the trade as a whole, but to the public who are our customers, and livelihood.—I am, etc.,

HARRY MOSS.

Bradford.

The Boiling Plate of Today.

[TO THE EDITOR.]

SIR,—The article in your issue of June 7th, by Mr. Stanley F. Bickell, entitled "The Boiling Plate of To-day," omitted to state that the "Superspeed" plate was my invention and is patented. I am, etc.,

ARCH. J. HOWARD,
Borough Electrical Engineer.

Taunton,
June 28th.

ILFORD EXTENSIONS.

New Plant at Ley Street and Goodmayes — Automatic Power Factor Regulation.

AN inspection of new plant and apparatus at the Electricity Works, Ley Street, Ilford, was made by the Mayor, Ald. G. Gunary, and members of the Electricity Committee, on Thursday. The occasion was also marked by the starting up of a new 1 500 kW auto-synchronous motor-generator and automatic power factor regulator, and the putting into operation of a 1 000 kW rotary convertor at Goodmayes sub-station by remote control.

The plant was designed and installed by Messrs. Crompton Parkinson, Ltd., and with respect to the automatic power factor regulator it is interesting to note that the increased number of induction motors installed (due to the development of supply undertakings) necessitates the careful consideration of low power factor and its unprofitable wattless current circulating in the mains. Messrs. Crompton Parkinson point out that each of these machines requires a magnetising current that lags 90 deg. behind the supply voltage so that a greater kVA input is demanded than is really justified by the kW or the mechanical effort of the motor.

The actual value of the magnetising current depends, to a certain extent, on the pole pitch and the radial air gap; it may be as small as 25% of the normal full load current, or (on machines having a very large number of poles of small pitch) it may be as large as 60% of the normal full load current. As the number of poles of an induction motor is equal to twice the frequency divided by the synchronous speed, high speed machines have a relatively small magnetising current.

When the power factor is low, the voltage regulation is adversely affected and the efficiency is impaired, affecting not only the generating plant but the entire system to which it is connected. E.g., if the power factor of a system is raised from 0·6 to 0·8 by the use of a Crompton Parkinson auto-synchronous motor, an existing feeder carrying a full load of 600 kW will, it is claimed, transmit an additional 200 kW without any increase in the size of the feeder or the generating plant, and, at the same time, the system will be relieved of idle currents or wattless magnetising currents due to the existing induction motors.

ELECTRICAL RESEARCH.

National Co-operative Investigation for the Electrical Industry.

RECOGNISING the national importance of the work of the British Electrical and Allied Industries Research Association representatives of all sections of the electrical industry have been in conference during the past few months and have prepared proposals to secure the future finances of the Association and extend its activities. These proposals will be submitted shortly to the industry and are strongly supported by a letter signed by leading representatives of electrical manufacturers, of authorised electricity supply undertakings, and others.

A copy of the letter has been sent to us, the contents of which are quoted below :—

"The British Electrical and Allied Industries Research Association has for the past eight years carried out a series of far-reaching investigations with results of great value to the country in general and in particular to all interested in the production, supply and use of electricity.

"The importance of this work is our justification for asking your attention at the present time to the Association and its prospects.

Objects of the Association.

"The main objects of the Electrical Research Association may be briefly summarised thus :—

"(A) To investigate matters affecting the proper utilisation of plant, apparatus and materials, with a view to greater reliability in operation and extension of useful life of such plant, leading to a reduction in the cost of electricity.

"(B) To investigate materials and methods used in the manufacture of electrical plant and apparatus, to develop improved and simplified methods of test for ensuring that materials reach a proper standard, and so secure the establishment of standards for performance which can be relied on by the manufacturers and users of plant and apparatus.

"Such investigations, it will be realised, benefit not only the makers of electrical machinery but all who use it, and not least those who supply electricity to the public.

"The Research Association was originally founded under the scheme of Research Associations developed by the Department of Scientific and Industrial Research, and has received from the Government financial support without which its work would have been impossible. This support has in accordance with the approved policy for Research Associations been on a diminishing scale and, under the present scheme, terminates next year.

"Meanwhile the demands on the Association by the industry are steadily increasing, and it is urgently necessary that it receive help on a more liberal scale than hitherto.

"While the Association has in the past derived its main support from the manufacturers, they alone cannot be expected to accept the responsibility of replacing the assistance hitherto accorded by the Government; hence we appeal to the manufacturers, the authorised undertakers throughout the country, both local authority and company, and consumers of electricity, who directly benefit in reduced expenditure from the work of the Research Association, to take their part in this necessary effort to obtain further financial support.

"Proposals as to a reorganisation to enable the work to be carried on and, if possible, extended, will reach you shortly. These have been drawn up by a representative Conference, and it is in connection with them that we ask, in your own interests as well as in the interests of the industry generally, that you will give their appeal your careful and sympathetic consideration."

The letter is signed by Sir John Snell, Chief Electricity Commissioner; Sir Andrew R. Duncan, Chairman of Central Electricity Board; Lt.-Col. K. Edgcumbe, President of the Institution of Electrical Engineers; Mr. A. Nichols Moore, President of the Incorporated Municipal Electrical Association; Mr. W. B. Woodhouse, President of the Incorporated Association of Electric Power Companies; Sir Harry Renwick, Chairman of the Provincial Electric Supply Association; Mr. J. Bailey, Chairman of Conference of Chief Officials of the London Electric Supply Companies; Dr. S. Z. de Ferranti, President of the British Electrical Development Association; Mr. V. Watlington, Chairman of the British Electrical and Allied Manufacturers' Association; Mr. Maurice Solomon, Chairman of the Cable Makers Association; Sir R. T. Glazebrook, Chairman of Representative Conference.

NEWS IN BRIEF.

An Electrical Beauty—Engineering Wages—British Association Members Sail for South Africa—Rural Electrification—Electrical Training in Schools.

EALING T.C. has agreed to appoint an assistant mains engineer at a commencing salary of £250 per annum.

Paignton Electric Light and Power Co. is to provide strip lighting by means of 500 lamps on the Paignton sea front bandstand at a cost of £120.

The winner of the first prize, of £1 000, in the "Sunday News" beauty competition was Miss Dorothy Hustwitt, employed in the Sterling Telephone and Electric Co.'s works at Dagenham.

The proprietor of British letters patent No. 111 089, dated October 23rd, 1916, for "Electric welding machines," desires to dispose of the patent rights or negotiate for the grant of licences to work thereunder. Inquiries to Messrs. Mewburn, Ellis and Co., 70–72, Chancery Lane, London, W.C.2.

Wigan T.C. is to provide electricity showrooms in Standishgate, at an estimated cost of £5 500.

It is reported that electric light is to be installed in the Bodleian Library, Oxford, and that the work will begin during the vacation.

Hull Corporation Telephones Committee has accepted a German tender for 4 000 insulators at £83, which was £34 less than the lowest British tender.

The Science Sixth Form of Wellington College visited London on Tuesday to inspect the Holborn automatic telephone exchange, and were entertained at luncheon by the Telephone Development Association.

Mr. J. Farndale, chief constable of Bradford, informed the Bradford Rotary Club recently that the Corporation had now accepted his police box scheme, and the dozen police stations would be superseded by 100 police boxes.

At the annual conference of the Association of Teachers of Domestic Subjects, at Birmingham recently, Miss Hilda Shaw (staff lecturer, National Training School of Cookery), speaking on the subject of "Electricity in the Schools," said economy had too often been neglected in the past. Electricity saved time, labour and drudgery, but if the use of electrical appliances was not taught to children then the best use of the appliances would not be attained.

Lieut.-Col. E. P. Anderson says, in his report to the Ministry of Transport on the collision which occurred on the L. and N.E. Railway at Darlington on March 9th, "the accident is one which could have been prevented by suitably arranged track circuiting. A scheme for resignalling this station, which would embody this feature, had already been under consideration by the company before this accident, and will, it is hoped, be proceeded with. But I understand that arrangements are being made to instal at once track circuiting, which would prevent a recurrence of this accident, without waiting for the rest of the scheme."

The Summer Meeting of the Whitworth Society was held in Manchester during the Summer Meeting of the Institution of Mechanical Engineers. A donation from the Whitworth Society in the form of a cheque for £25, drawn in favour of the Manchester College of Technology, was handed to the Lord Mayor of Manchester, to be disbursed in the form of prizes to students who intend to compete for Whitworth Scholarships. The dinner was held at the Engineers' Club, Manchester, the chair being taken by the President, Mr. Fred H. Livens, Wh.Sc., who inducted into office the new President, Mr. William H. Fowler, Wh.Sc. The address of the hon. secretary of the Whitworth Society is: c/o Institution of Mechanical Engineers, Storey's Gate, Westminster, S.W.1.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *of July 5th, 1879:*

The electric lighting experiment at the Salon made portraits "look well," but with landscapes with grass and water the effect was "unpleasing."

When an electrical machine is in activity and giving strong sparks, the machine may be made to lose all tension if the red vapour of peroxide of nitrogen (N_2O_4) is allowed to escape into the space traversed by the sparks. This phenomenon was observed by M. Hempel.

* * *

Twenty-five years ago, THE ELECTRICIAN, *of July 8th, 1904, recorded that:*

The Bristol Electricity Department was using an electric launch for conveying passengers and goods between the Temple Bank and Avonbank generating stations.

* * *

Fifteen years ago, THE ELECTRICIAN *of July 3rd, 1914, announced that:*

The action between Marconi's Wireless Telegraph Co. and the Helsby Wireless Telegraph Co., with respect to infringement of the well-known letters patent No. 7777 of 1900, was being heard before Mr. Justice Eve.

An exhibition of electric lighting and cooking is open at the Old English Fair of the Hackney Rotary Club, and will close to-morrow (July 6th).

Ilford Electricity Committee has obtained sanction to borrow £5 000 for domestic apparatus to be let on hire. The borough Electrical Engineer and the Borough Engineer and Surveyor are to submit sketch plans of proposed new offices and showrooms at the junction of High Road and Clark's Road.

The first contingent of 170 men and women scientists who are taking part in the British Association's South Africa meeting at Table Bay left Tilbury for Cape Town on June 27th. The last contingent, including the president, Sir Thomas Holland, will leave to-day (Friday). Sir Oliver Lodge and Sir William Bragg are unable to go.

Herne Bay U.D.C. is considering a proposal to floodlight the grand pier pavilion and King's Hall.

A proposal to lay an additional telephone cable between Great Britain and France is under consideration.

A representative of Plymouth electricity department has been in attendance at Messrs. Spooner's departmental store for a week and has given cooking demonstrations in the store theatre and lectures showing the advantages of cooking by electricity.

An electrical exhibition organised by the Western Electricity Supply Co., Ltd., was held last week at Streatley. Mr. A. J. Bridge, development manager of the Company, explained the system whereby electricity was being extended throughout its area. He added that the new branch at Goring was under the management of Mr. E. Feltham.

Mr. F. M. Long, city electrical engineer, Norwich, said, in a paper read by him at the luncheon of the Norwich Rotary Club last week, on all farms a certain amount of power is required, and for this electric motors are especially suitable, not only on account of low first cost and economy in running, but because most of the operations are intermittent and with motors there was no time lost in starting up or in shutting down. Motors, too, could be put anywhere.

The Governing Body of Manchester Municipal College of Technology offers research scholarships under which research may be undertaken in the mechanical engineering, electrical engineering, chemistry (including electro-chemistry) and other departments. A limited number of such scholarships, tenable during 1929-30 and each of a value not exceeding £100, will be awarded in July, 1929.

Captain C. B. Platt, superintending testing officer, and Mr. G. A. Cutler, analyst, have reported to the Mines Department on an investigation made by them at the mines' testing station, Sheffield, of the safety of miners' electric cap lamps when the battery is short-circuited. They state that the danger to be apprehended from a short-circuited cap lamp battery is probably very remote, but an adequately designed fuse would eliminate an accident due to this cause.

On June 19th the Central Council of the Engineering and Allied Employers' National Federation were in negotiation with the representatives of over thirty trade unions having members employed in that industry on the subject of the claim of the unions for a wage advance of 8s. weekly all round to time workers and an equivalent advance in piece rates. The proposal on behalf of the employers to adjourn the matter till the end of the year was found unacceptable by the union representatives, and they agreed to report to their executives, and to reassemble on July 25th.

PERSONAL.

SOUTHEND-ON-SEA T.C. has granted the borough electrical engineer, Mr. Robert Birkett, a further three months' leave of absence.

Sir John Gatti, who was chairman of the London County Council in 1927/28, has been presented with a portrait of himself by his former colleagues on the Council.

Ald. H. Lazarus has resigned from the London and Home Counties Joint Electricity Authority, and Coun. G. Groves has been appointed in his place, as representing Stepney B.C.

Basingstoke T.C. has granted an honorarium of £75 to the borough electrical engineer, Mr. F. Swarbrick, and one of £40 to Mr. Castle, for additional services in connection with extensions in the rural area.

Mr. C. W. Charlesworth, of Marconi's Wireless Telegraph Co., Ltd., has accepted an appointment with the Gramophone Co., Ltd. Mr. Charlesworth is a director of the Sterling Telephone and Electric Co., Ltd.

Mr. S. E. Fedden has been presented with an antique table and a pair of sportsman's field glasses by the employees of the Sheffield Electricity Department. Mr. Fedden presented the department's sports and social club with a pair of silver cups for competition in the tennis section.

Mr. Alexander D. D. M'Kay has been appointed head of the mathematical department of Dundee Technical College, in succession to Mr. W. Cooper, who recently received an appointment at Leeds Technical College. In 1921 Mr. M'Kay was appointed lecturer in pure and applied mathematics at the Royal Technical College, Salford.

West Ham T.C., in accepting the resignation of Mr. F. W. Purse, borough electrical engineer and manager, on his appointment as chief engineer to the London and Home Counties Joint Electricity Authority, has decided to present to him an illuminated testimonial on vellum, expressing the Council's high appreciation of his valuable services.

Mr. T. E. Eachus, superintendent of the Northern area of the North Metropolitan Electric Power Supply Co., who is leaving to become managing director of the Young Battery Co., Ltd., was recently presented by the staff at St. Albans with a walnut card table and a leather bound album containing the names of the subscribers from the company's undertakings at Harpenden, Hertford, Royston, Stevenage, and Welwyn, and the Overhead Line Department. Mr. Eachus has been with the company 24 years, 21 of which he has spent at St. Albans.

Prof. R. Stanfield retires at the end of this session from the professional chair which he has filled at the Heriot-Watt College with conspicuous success for thirty years. A desire has been widely expressed that this occasion should not be allowed to pass without some demonstration to the Professor of the high esteem in which he is held by the thousands of students and others who have benefited from his instruction and friendship during the long period of his connection with the Heriot-Watt College. A committee has been formed to carry this wish into effect, and the honorary treasurer will be very glad to receive and acknowledge subscriptions from present and former students and colleagues, and any others who would care to be associated with the testimonial. The exact nature of the testimonial will be decided later in consultation with Professor Stanfield, but it has been decided to make the presentation in October. It is, therefore, essential that all subscriptions should reach the honorary treasurer, Mr. Wm. Watson, Heriot-Watt College, not later than September 15th.

Obituary.

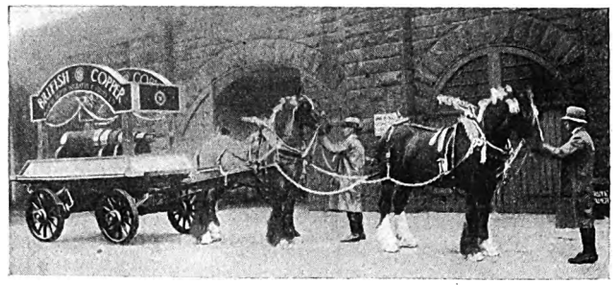
MR. RONALD MARSHALL, aged 56 years, formerly chief electrical engineer to Ayr Corporation. He was appointed burgh electrical engineer in 1903, in succession to Mr. A. Fuller, and he retired in 1923, when the undertaking was taken over by the Ayrshire Electricity Board.

MR. FRANCIS KENNEDY CASSELS, on June 18th, in his 70th year. Mr. Francis Kennedy Cassels was a pioneer of electrical industry in the Argentine, and was connected with that country for a great part of his life. He was educated at Percival House, Blackheath, Repton, and King's College, London. Between 1883 and 1900 he erected the first supply stations in the Argentine, at Buenos Ayres, La Plata and other cities. In 1908 he presented a scheme for the utilisation of the Iguasu Falls, and the transmission of power to Buenos Ayres, a distance of 750 miles. This scheme was not carried out, but it has recently come before the Congress again.

BUSINESS ITEMS.

THE address of the NORTH WALES POWER CO., LTD., has been changed to Artillery House, Victoria Street, London, S.W.1.

At a Horse Show and Parade of Tradesmen's Turnouts,



This team, entered by British Insulated Cables Ltd., in the St. Helens Horse Show and Parade of Tradesmen's Turnouts, was awarded a number of prizes.

recently held in St. Helens, BRITISH INSULATED CABLES LTD., who had entered a pair of horses and a decorated wagon, carried off four first prizes and one second, as well as winning the Shire Horse Society's Premium and Silver Medal.

The address of the HYDRONYL SYNDICATE, LTD., has been changed to Medway House, Horseferry Road, Westminster, London, S.W.1.

The address of the INDIVIDUALIST BOOKSHOP, LTD., has been changed from 84, Charing Cross Road to 53, Victoria Street, London, S.W.1 (Victoria 0850).

The CONCORDIA ELECTRIC WIRE CO., LTD., announces that new offices and stores will shortly be opened at 81, Milton Street, Sydney Avenue, London, E.C.2.

BRITISH INSULATED CABLES LTD., of Prescot, Lancs., have recently received orders for approximately 10 miles of supertension cable for overseas and 500 miles of steel cored aluminium strand for use on the English grid schemes.

The number of exhibitors at the Lyons International Fair, was 3 427, an increase of 65 over 1928, but a decrease in the number of foreign exhibitors. Amongst the principal industries represented were: metal manufacturers, 533 stands, and electrical trades, 126 stands.

DRAKE AND GORHAM, LTD., Rockingham Works, Newington Causeway, London, S.E.1, announce that Messrs. POOLEY AND AUSTIN, of 34, Broadway, Westminster, London, S.W.1, are their agents for the sale of e.h.t. and l.t. switchgear in London and the South Eastern counties.

BRUCE PEEBLES AND CO., LTD., Edinburgh, advise us they have appointed Mr. George E. Whitehead, of 102, St. Mary Street, Cardiff, as their representative for South Wales and the counties of Gloucester, Somerset, Devon and Cornwall, and that all arrangements have been made with regard to service in connection with existing plant, installations, etc.

TUNGSRAM ELECTRIC LAMP WORKS (GREAT BRITAIN), LTD., announce that the Manchester and district office, trade counter and warehouses, under the management of Mr. E. C. Thurley, are now at 9, South Street, and the Bristol branch, under the management of Mr. W. Weeks, has removed to 54/56, Victoria Street.

In conjunction with the Air Ministry, WIRELESS PICTURES (1928), LTD., are carrying out an interesting series of experiments. On Tuesday and Thursday between 2 p.m. and 2.25 p.m. synoptic weather charts are sent out from 5XX, and reports on the reception of these charts from as many different places as possible would be of value to those conducting the test. Any reader who possesses a "Fultograph" and is willing to co-operate can obtain a supply of prepared paper and envelopes, as well as full particulars of the reports required, by writing to Wireless Pictures (1928), Ltd., Dorland House, 14-16, Regent Street, London, S.W.1.

One of the season's most popular events is the R.A.F. Pageant at Hendon, this year to be held on July 13th. For the fifth successive year "Marconiphones" are being installed, and there will be nearly 60 loud speakers, 180 amplifiers, the last stage of which will employ five 32-power valve banks. The energy for the system is being provided by a motor generator giving 350 V and "Exide" accumulators aggregating 2 000 V, the total h.t. current being 6 000 mA at 350 V. The l.t. consumption will be over 350 A at six V. Twelve miles of heavy armoured cable will be buried for connecting thirty loud speaker positions round the aerodrome.

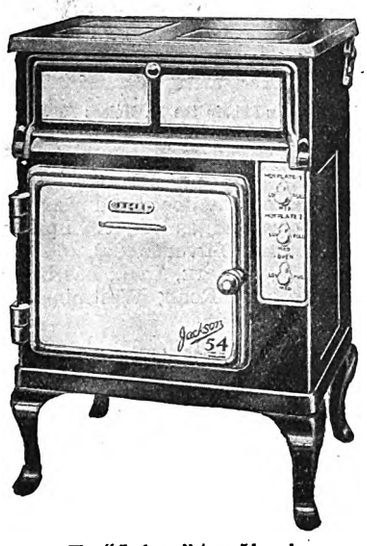
THE ELECTRIC COOKER TRADE.

Particulars of Some of the New and Improved Models—Designs to Suit Both Large and Small Requirements.

WHEN hot weather makes its re-appearance many will wish it were possible to get far away from their hot kitchens. If, however, the kitchen can be made cool, all is well, and in order to assist contractors in showing the public how easily this may be done, we give this week particulars of various electric cookers and allied apparatus.

Among newest cookers, the series of five recently put on the market by LANE AND GIRVAN, LTD., are worthy of notice. This firm, whose address is Caledonia Stove and Electrical Works, Bonnybridge, near Glasgow, have just added to their plant a "model" electrical factory, which is stated to be built and equipped on the most modern lines, so that standardisation and uniformity in design may be fully realised. Appearance is an important feature in the design of cooking appliances, and in "Caledonia" cookers porcelain enamel finishes predominate both inside and out. Lightness of outline is also studied, without strength being impaired. All parts are easily accessible and removable, and, where possible, corners, crevices and ledges have been avoided and rounded parts substituted. The oven interiors are provided with nickelled wire runners and can be automatically locked in position without fixing screws. Standard practice is for the inside of the oven to be porcelain enamelled, but plain finish can be obtained when price reduction is of paramount importance. Side and bottom heat is arranged for in the ovens, control and regulation being through one switch. The cool-grip door handle is stated to be the only handle that automatically takes up wear and ensures an adequately sealed door at all times. It is simple—comprising one casting only. Circular boiling plates, with pin and socket connection, are used. Earthing pins are included, and it is possible to adjust the level accurately by means of three adjustable screw pins. All boiling plates in Caledonia cookers are at present of the solid "Sadia" type, but Lane and Girvan, Ltd., are developing another solid type to interchange with the "Sadia." In these plates the resistance wires are welded into Monel metal pins, and the sockets consist of phosphor bronze laminated pieces.



The "Jackson" type 54 cooker.

The following are included among other electrical features to which the firm seek to draw special attention. All wiring is carried on porcelain insulators. The main terminal block is built on the unit principle to allow of wiring to any supply system. Switches are of the flush type, housed in a box at the side of the cooker. Either "Zed" or "Arctic" fuses are supplied, as specified. The grill element is arranged for heat regulation; for the radiant coils the reinforced type is chosen, to give long life. The oven elements contain coils working at low current density, and are said to be of specially simple design. It is stated all "Caledonia" cookers are tested on a 1 500 V flash test, as well as being heated up before leaving the works.

The Caledonia model 1554 is designed for households of six to eight persons. The overall size is 31 in. wide by 37 in. high by 22 in. deep, while the oven cooking space is 16 in. by 18 in. by 16 in. The total weight is 348 lbs. Total watts are 8 250, divided as follows: oven, 3 000; grill, 1 500; boiling plates, 2 000, 1 200, and 550 respectively. Two similar cookers are provided: one for households of four to six, and the other for smaller families, such as those living in the modern dwelling of housing schemes. The smaller of these two has only one three-heat boiling plate on the hob; the three-heat grill acts as top element in the oven, which in this model is not removable. The "Caledonia" domestic baking plate appears to be a most useful cooking appliance. It has been designed for the home baking of scones and similar table delicacies. The smaller plate, it is said, will bake half a gross of scones within an hour, with a consumption of less than a unit. This baking plate is finished in black enamel and has a bright polished top. The "Caledonia" breakfast cooker is designed so that grilling and boiling are possible simultaneously. When it is required for boiling only, an asbestos mat is inserted beneath the element to deflect the heat to the base of the utensil on the hob. For grilling only, the mat is placed on top of the hob.

A new cooker just brought out by THE JACKSON ELECTRIC STOVE CO., LTD., of 143, Sloane Street, London, S.W.1, is known as the "Overseas" model. It has been designed specially for export, and the firm hopes it will have a large sale in most of the Dominions. This cooker has an oven with cooking space 13½ in. high by 13½ in. wide by 15½ in. deep, loaded to 1 650 W and fitted with a drop-down door. The hob has a grill-boiling plate measuring 9 in. by 7½ in., loaded to 1 800 W, and two hotplates of the firm's latest pattern (No. 86). The hotplates are each size 8½ in. by 6 in., loaded to 1 500 W. All units are arranged for three-heat control, switches and fuses being fitted in the control space on the side of the cooker. A door of the drop-down type is fitted to the space between the hob and the top of the oven; the oven and the hot cupboard are both fitted with white panels, mottled grey, inside. The switch direction plate is finished in white vitreous enamel with black lettering. The Jackson No. 52 cooker supersedes model 19A. The oven has cooking space for three to four persons, and is loaded to attain a cooking temperature in about 20 minutes from switching on; the interior is of steel plate, finished in mottled-grey vitreous enamel. Special features of the No. 52 include rounding of all oven corners, improved lagging and protected free-spiral boiling plates of what is claimed to be an improved design. Various similar cookers in larger sizes are available, and there is also the No. 46 cooking cabinet de luxe, which can be obtained with "Marblon" mottled-enamel hob and front. The total watts are 7 850: under normal conditions the maximum load does not exceed 60%.

Another well-known cooker is the "Met-Vick Standard," with splash plate and rack.

SADIA, LTD., 22, Newman Street, Oxford Street, London, W.1, manufacture electric ranges for large kitchens—in hotels, restaurants, etc. The ten models offered have total consumptions between the limits of 19 000 and 41 000 W; the hotplates are 11¾ in. in diameter, and are loaded to 2 000 W. The smallest model is 57½ in. by 44¼ in. by 31½ in.; the largest, 110 in. by 52½ in. by 31½ in. Some of the ranges can be supplied for use from both sides. To each hotplate 8 deg. of heating can be given, while the ovens have 16-heat control. The two outside ovens can be opened from each end. Panel construction is used in the interior of the ranges, so that any element can be withdrawn. The elements are of michrome on mica blades. The boiling table is built in sections.

Digitized by Google

These cookers are wired in three sections, and each section is wired in three parts, in order to facilitate the use of a cooker with three-phase supply. For example, assuming the loading to be 30 kW, it can be split into two sections of 15 kW each, or six sections of 5 kW each, so that the system may be properly balanced. A tray for catching drips is fitted under each section of the boiling table. In the standard construction the top is of black cast-iron, the lower part of fire-blacked wrought iron, and the fittings nickel plated. The ranges can also be obtained in white enamel. A point particularly emphasised by the makers is the efficient lagging of the ovens.

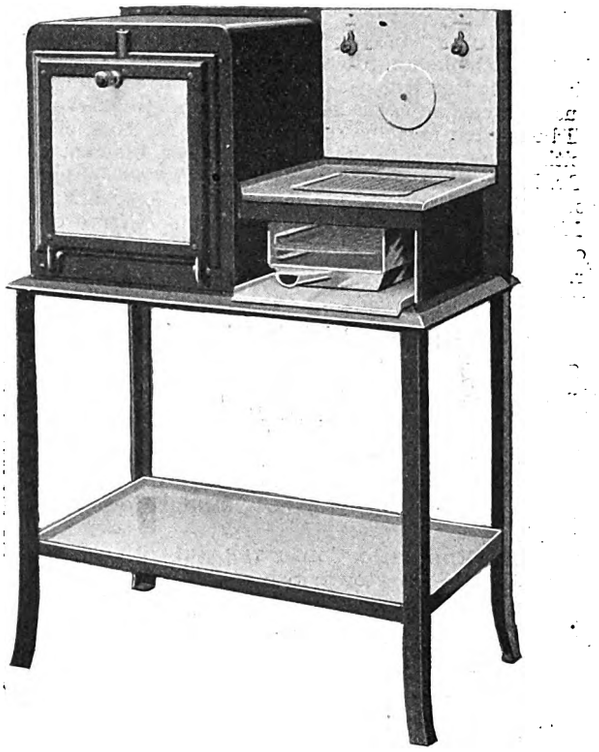
A new series of "Hotpoint Falco" cookers has recently been introduced by THE HOTPOINT ELECTRIC APPLIANCE CO., LTD., of 24, Newman Street, London, W.1. Unit construction of electrical parts is one feature of these cookers. The oven element assembly is in one unit, and can be removed from the oven by undoing two wing nuts and three terminal wires. Similarly, the switch assembly is made in one complete unit: it can be easily removed after detaching the right hand portion of the hob and disconnecting the leads from the boiling plates, grill and oven. The wiring of the cookers is simple. Where a long run of conductor is necessary, as under the hob to the boiling plate on the extreme left, the wiring is carried in a channel of cast iron, vitreous enamelled. This coating of enamel is made to withstand a voltage of 1 500 R.M.S. to earth. The unit switch assembly is common to several sizes of cooker, and many individual parts required in the mechanical assembly of the various cookers are interchangeable. The simple construction enables the cookers to be stripped in a few minutes. A cast iron crown plate with protecting rim is provided. The standard finish is as follows: Hob, oven and door pad—porcelain enamelled in mottled grey. Inner oven—mass coat vitreous enamelled. Doors to oven and grill chamber—porcelain enamelled panels in white. Other parts (with exception of the switch-indicating plate) stove enamelled in black.

Among the latest cookers put on the market by THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, is the "Magnet Minor," for families of three to four persons—or for the breakfasts of larger families. This cooker is provided with separate self-contained units for boiling and grilling, and the grill element, although part of the oven heater, is separately regulated. An additional switch is fitted to control the bottom heat when required. The 7 in. circular hotplate is totally enclosed, has three-heat control and is guaranteed for two years. Switches are of the reciprocating type; the separate Home Office pattern fuses for hotplate and grill-oven are provided with protection against accidental removal. The total wattage is 3 500.

A popular cooker by Lane and Girvan Ltd.

The "Magnet" electric cooker No. DC 5 765 is slightly larger, and side-heating is employed for its oven. A more completely equipped cooker is DC 5 760, which has oven, grill, and two enclosed hotplates, each arranged for three-heat independent control. In the standard finish the exterior, including facings and legs, is black stove-enamelled, the hob is porcelain enamelled mottled grey and door and switch panels are enamelled white. The de-luxe finish includes mottled grey porcelain enamelling of the hob and other exterior parts, with the front legs nickel-plated and polished.

A new cooker manufactured by THE MANOR ELECTRIC OVEN AND FIRE CO., 303, High Road, Chiswick, London, W.4, is known as the "Manorette." This inexpensive model is sold complete with or without stand, and has vitreous enamelled oven interior and door panel. The door and front frame are constructed of steel. The body is of 20 gauge mild steel, the base plate and back of 18 gauge and the stand of $\frac{1}{8}$ in. angle steel. All steel parts are treated with a rust-preventing compound, stoved on, and the exterior is finished in black stove-enamel. The space between the inner and outer walls of the oven is lagged with slag wool—$1\frac{1}{2}$ in. at sides and back,



The "Manorette" cooker, with stand, by the Manor Electric Oven and Fire Co.

and $2\frac{1}{4}$ in. at top and bottom. The interior dimensions of the oven are 12 in. by 12 in. by 11 in., and its loading is 1 200 W. The boiling plate and grill are of the standard plug-in type, loaded to 1 800 W. The oven and boiling plate are each controlled by a three-heat switch fitted at the back of the hob. All wiring, switches, fuses, main terminals, etc. (with the exception of the oven elements) are accessible from the front of the cooker. A vitreous enamelled crown plate is supplied, and a similarly finished pot shelf and a thermometer can be obtained as extras.

THE REVO ELECTRIC CO., LTD., of Britannia Works, Tividale, Tipton, Staffs, and 30, Great Queen Street, Kingsway, London, W.C.2, are makers of cookers in several shapes and sizes. One of the most notable features of these cookers is the vitreous enamelling on both sides of the sheet metal work. The exterior of the sides and back and the interior of the oven, door panels, and hot cupboard containing grid are all vitreous enamelled in mottled grey. This enamel has been chosen as standard on account of its hard wearing qualities, and because it does not show surface scratches readily, but it might well have been decided upon on grounds of appearance alone, as the cookers are most attractive objects. This double-side enamelling is claimed to add five years to the life of these models. Much has been done to improve the general finish of Revo cookers. All cast parts, except the hob, are now stove enamelled black after polishing. An improved door catch is fitted; it is said to be unique, and our representative gives a very good account of its effectiveness. The oven door will close firmly on a gentle push from the hand or foot, and by pressing down on the handle an almost hermetic joint can be obtained. The catch has no spring, but is operated by gravity on a new system, and its simplicity should ensure freedom from mechanical disorder.

METRO-VICK SUPPLIES, Trafford Park, Manchester, produce, among others, two electric cookers, known as the "small model" and the "standard model." The former has been designed for use in bungalows, flats and small houses where space is limited. The oven is double cased, effectively lagged and fitted with collapsible interior. In both models "Met-Vick" patent "trouble-proof" elements are fitted.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

BRACEBRIDGE MENTAL HOSPITAL.—Electrical installation (lighting, telephones, fire alarms, etc.) for two new villas now being erected at Bracebridge Heath, near Lincoln. Applications for inclusion in the list of contractors from whom tenders will be invited must be sent to Mr. H. E. Page, clerk to the Visiting Committee, 5 and 6, Bank Street, Lincoln.

ST. MARY'S SCHOOLS, LOWER INCE, WIGAN.—Electric light installation. Particulars from the vicar, Rev. S. Bryson.

MANCHESTER CORPORATION, July 5th.—Supply of 500 and 1 000 kVA static transformers. Specification (No. 254) from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

Electric Lighting Installation.

STOKE-ON-TRENT CORPORATION, July 6th.—Electric lighting of new cubicle block and garage at Infectious Diseases Hospital. Names to be sent to Mr. E. B. Sharpley, town clerk, by July 6th.

BELFAST ASYLUM COMMITTEE, July 8th.—Supply and erection of electric lighting equipment for main avenues. Specifications, etc., from the Secretary, Mental Hospital, Saintfield Road, Belfast.

CARLISLE EDUCATION COMMITTEE, July 8th.—Electric light installation in Newtown Schools. Particulars from the surveyor, Mr. Percy Dalton, 18, Fisher Street, Carlisle.

EDINBURGH CORPORATION, July 8th.—Automatic electric elevator, for Portobello power station. Specification (No. 101) from Mr. E. Seddon, engineer and manager, Electricity Department; deposit £1 1s.

LONDON COUNTY COUNCIL, July 8th.—Manufacture, supply and maintenance of (*a*) 150 electric tramcar bodies; (*b*) 150 sets of swing bolster bogie trucks; (*c*) 150 sets of electrical equipment for tramcars, with assembly of bodies, trucks, electrical equipment, etc., into complete tramcars; and (*d*) 150 sets of magnetic track and wheel brake equipments. Specifications, etc., from the Clerk, County Hall, Westminster Bridge, S.E.1; deposit £2 for each section, or £7 for the four.

RHONDDA URBAN DISTRICT COUNCIL, July 8th.—Three centrifugal pumps, with two electric motors and a crude oil or gas engine. Specification, etc., from the Engineer, Council Offices, Pentre, Rhondda.

SUNDERLAND CORPORATION, July 8th.—Manufacture and supply of 12 months' requirements of (*a*) paper insulated, lead sheathed cable, (*b*) rubber insulated wire, (*c*) consumers' meters, and (*d*) gasfilled and vacuum lamps. Specifications from the General Manager, Electricity Offices, Dunning Street, Sunderland; 10s. deposit for each section. Applications must state the classes of goods for which specifications are desired.

WARKWORTH PARISH COUNCIL, July 9th.—Installation of 19 electric street lighting lamps. Specifications can be seen at the office of the clerk, Mr. M. Weddell, Mill Bank, Warkworth, Morpeth.

DUNDEE CORPORATION, July 10th.—Supply of seven panel, e.h.t. compound filled sub-station switchboard, for 6 600 V, three-phase, 50-cycle system. Specifications from Mr. D. H. Bishop, Electricity Supply Department, Dudhope Crescent Road, Dundee.

ENNISKILLEN URBAN DISTRICT COUNCIL, July 10th.—Electric light installation in town hall. Specification can be seen at the office of the Borough Surveyor.

METROPOLITAN ASYLUMS BOARD, July 10th.—Supply and fixing of a wireless installation at Princess Mary's Hospital, Cliftonville, Margate. Specification, etc., from the Board's Office, Victoria Embankment, London, E.C.4; deposit £1.

NEWPORT EDUCATION COMMITTEE, July 10th.—Electric light installations at Alexandra and Eveswell Schools. Particulars from the Borough Architect, Town Hall, Newport, Mon.; £1 1s. deposit in respect of each contract.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, July 10th.—Supply and erection of Ironbridge power station of three boilers, each having normal rating of 225 000 lb. of steam per hour, with economisers, air heaters, fans, ironwork, pipework, coal pulverising plant, ash handling plant, etc. Specification (No. 3), etc., from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

WEST RIDING EDUCATION COMMITTEE, July 11th.—Electric lighting installation in Penistone Grammar School. Specifications, etc., from the Education Officer, County Hall, Wakefield.

BIRMINGHAM GUARDIANS, July 12th.—Electric light installation at the Quinton Hall Institution. Specification from the Clerk, Union Offices, Edmund Street, Birmingham; deposit £2 2s.

CARLISLE CORPORATION, July 12th.—Supply and erection of switchgear for use in 11 000 V, three-phase, 50 cycle substation. Specification, etc., from Mr. C. W. Salt, city electrical engineer; deposit £2 2s.

ILKLEY URBAN DISTRICT COUNCIL, July 12th.—Supply and erection of 11 000 V combined cubicle and truck type switchgear, transformer kiosk, 300 kVA and l.t. feeder gear; and 11 000 V feeder and l.t. distributors. Specifications from Mr. S. H. Fowles, Electricity Offices, Chantry Drive, Ilkley; deposit £1 1s. for each.

RIVER AVON JOINT COMMITTEE, July 15th.—Electrically-operated and controlled sluice gates at Tewkesbury. Specification, etc., from Mr. T. Hindmarsh, land drainage officer, Shire Hall, Gloucester; deposit £1 1s.

HULL CORPORATION, July 16th.—Installation of electric lift at Central Public Library. Specification from the City Architect, Guildhall, Hull.

CENTRAL ELECTRICITY BOARD, July 22nd.—Supply and erection of central indicators and telephones in connection with the Central Scotland Electricity Scheme. Specification (C.S.-S.S. 15) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

GAINSBOROUGH URBAN DISTRICT COUNCIL, July 24th.—Electric motors and pumps. Further particulars from Mr. S. W. Parker, waterworks engineer, Council Offices, Gainsborough; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, July 27th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Mid-East England Electricity Scheme. Specification (No. M.E.E.-P.L. 1), etc., from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, W.C.2; deposit £2 2s.

CARDIFF RURAL DISTRICT COUNCIL, July 29th.—Sub-station equipment, underground cables, overhead lines, etc., in parish of Radyr, near Cardiff. Forms of tender from Mr. R. Howard Fletcher, 3, Park Place, Cardiff.

NEWCASTLE ENDOWED SCHOOLS, August 24th.—Electric light installation in a new wing to be erected at each of two schools, viz.: Newcastle-under-Lyme High School, and Newcastle-under-Lyme Orme Girls' School. Specifications, etc., from Messrs. Cramp and Frith, 1, Dickinson Street, Manchester; deposit £3 3s. in respect of one contract, or £6 6s. in respect of both contracts. Tenders are invited only from firms on the National Register of Electrical Installation Contractors.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

IXELLES COMMUNAL ADMINISTRATION, July 5th.—Supply of a.c. meters. (Reference B.X. 5 400.)

INDIA STORE DEPARTMENT, July 5th.—Telephone cords, two, three, four and six conductor. Forms and tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

NEW ZEALAND POSTS AND TELEGRAPHS, July 6th.—Supply of v.i.r. wire (No. P. and T. 151/1 576). (Reference B.X. 5 411.)

NEW ZEALAND POSTS AND TELEGRAPHS, July 10th.—Supply of enamelled and cotton core, lead sheathed cable. (No. P. and T. 151/1 577). (Reference B.X. 5 413.)

INDIAN STORES DEPARTMENT, July 8th.—Supply of 30 kW oil-engine-driven generating set for Military Engineering Services, St. Thomas Mount, Madras. (Reference B.X. 5 364.)

Digitized by Google

LOURENÇO MARQUES PORT AND RAILWAYS BOARD, July 8th.—Supply of two 5-ton electric portal cranes (Circular No. 60). (Reference A.X. 7 994.)

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

NEW ZEALAND POSTS AND TELEGRAPHS, July 9th.—Supply of dial cords (No. P. and T. 151/1 557). (Reference B.X. 5 412.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 9th.—Resistances and reactances. (Reference B.X. 5 281.)

NEW SOUTH WALES GOVERNMENT RAILWAYS, July 10th.—One 750 kW turbo-alternator; 2 200 V ironclad switchgear; two switch operating batteries; and two motor generator sets. Specifications from the Chief Electrical Engineer, 61, Hunter Street, Sydney.

PORT ELIZABETH MUNICIPALITY, July 11th.—Transformers, overhead line equipment, etc. (Reference B.X. 5 375.)

CHILEAN MINISTRY OF MARINE, July 12th.—Supply and erection of two aerial towers for new wireless station at Arica, the aerial to consist of 8 phosphor bronze cables, 200 metres in length. (Reference A.X. 8 134.)

INDIA STORE DEPARTMENT, July 12th.—Supply of three continuous wave wireless transmitting sets (580 to 3 000 metres). Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

EGYPTIAN STATE RAILWAYS, July 13th.—Supply of underground, lead-covered, paper core telephone cables (approximate value £E.25 000.)

AUCKLAND ELECTRIC POWER BOARD, July 15th.—Supply of 22 000 V cable and accessories. (Reference B.X. 5 414.)

EGYPTIAN MINISTRY OF THE INTERIOR, July 15th.—Supply and erection at Mena power station of one Diesel engine driven a.c. generating set of 250 kVA. (Reference B.X 5 331.)

VICTORIAN ELECTRICITY COMMISSION, July 15th.—Two 750 kVA transformers and spares (No. 29/42). (Reference B.X. 5 325.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 16th.—Supply of 250 galvanised steel transmission line towers to carry copper conductors, or 190 towers to carry steel-core aluminium conductors. (Reference A.X. 7 735.)

POSTMASTER-GENERAL'S DEPARTMENT, Melbourne, July 23rd.—Telegraph instruments (schedule C. 436). (Reference B.X. 5 323.)

VICTORIAN RAILWAY COMMISSION, July 24th.—Electric overhead travelling cranes, spare motors, and down shop trolley wires (contract No. 42 672). (Reference A.X. 8 092.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, July 25th.—Supply of two 2-ton electrically-driven hoist blocks (tender No. 1 471). (Reference A.X. 8 072.)

Electric Pumping Plant.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 30th.—Motor driven centrifugal pump, to deliver 400 gallons per minute against total head of 50 feet, the motor to be wound for 230 V d.c. (Reference A.X. 8 150).

SOUTH AFRICAN RAILWAYS AND HARBOURS, August 1st.—One 10-ton electrically-driven overhead travelling crane, for Maritzburg workshops (tender No. 1 487). (Reference A.X. 8 105.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 1st.—Supply of telephone cable (tender No. 160). (Reference B.X. 5 345.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor, overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

NEW ZEALAND POSTS AND TELEGRAPHS, August 7th.—Enamelled and silk-covered resistance wire (No. P. and T. 151/1 497). (Reference B.X. 5 322.)

Telegraph Material for South Africa.

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 8th.—Telegraph material, including g.i. tubular side-arms, insulators, paper sleeves, insulator spindles, etc. (tender No. 161). (Reference A.X. 8 112.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, August 12th.—Supply and erection at Burrinjuck of auxiliary hydro-electric generating plant. (Reference B.X. 5 365.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 13th.—Supply of electric power plant, with underground and overhead network, for the town of Maghagha, Minieh Province. (Reference B.X. 5 318.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th.—Water turbine driven generating sets and switchgear, for Waitaki power development (section 2). (Reference B.X. 5 278.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply of h.t and l.t. cable, lamps and sundries, in connection with extensions of the electricity undertaking. (Reference B.X. 5 312.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply and erection of steam raising plant, engine, alternator and switchgear (contract A). (Reference A.X. 7 983.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 15th.—Supply and erection of additional Diesel engine and alternator at Zagazig power station. (Reference B.X. 5 393.)

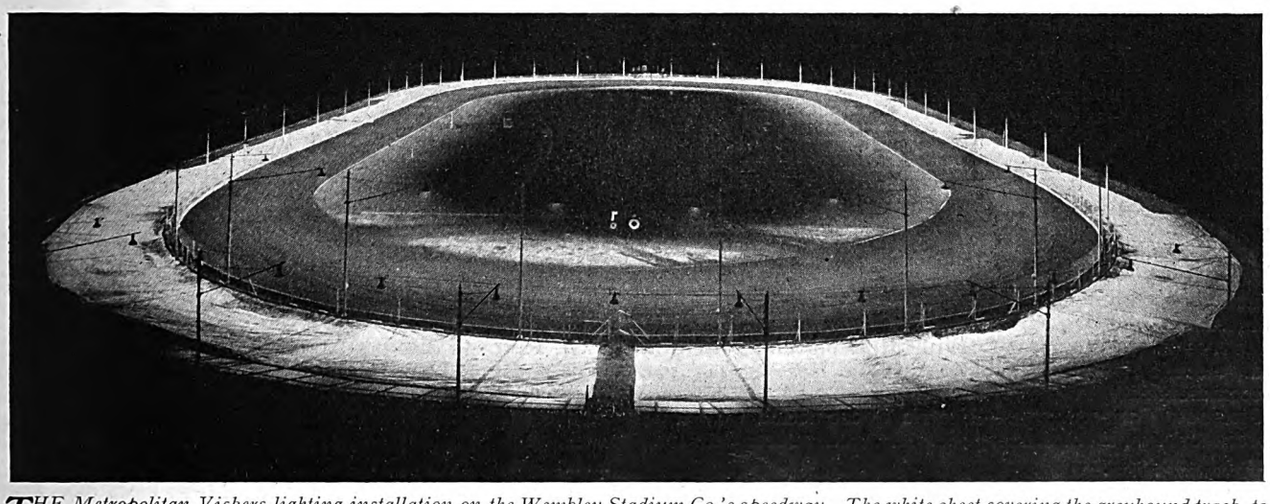
SOUTH AFRICAN RAILWAYS AND HARBOURS, August 15th.—Electrically driven plate bending and flattening machine (tender No. 1 498). (Reference A.X. 8 164.)

CHILEAN STATE RAILWAYS, August 16th.—Material for overhead lines, underground cable and cable boxes (Group 41); and material for lighting of locomotives and carriages (Group 43). (Reference C. 3 069*.)

CHILEAN STATE RAILWAYS, August 16th.—Telegraph and telephone materials, including copper wire and cable, switches, table telephones (Ericsson type), telephone cords, etc. (Reference C. 3 070*.)

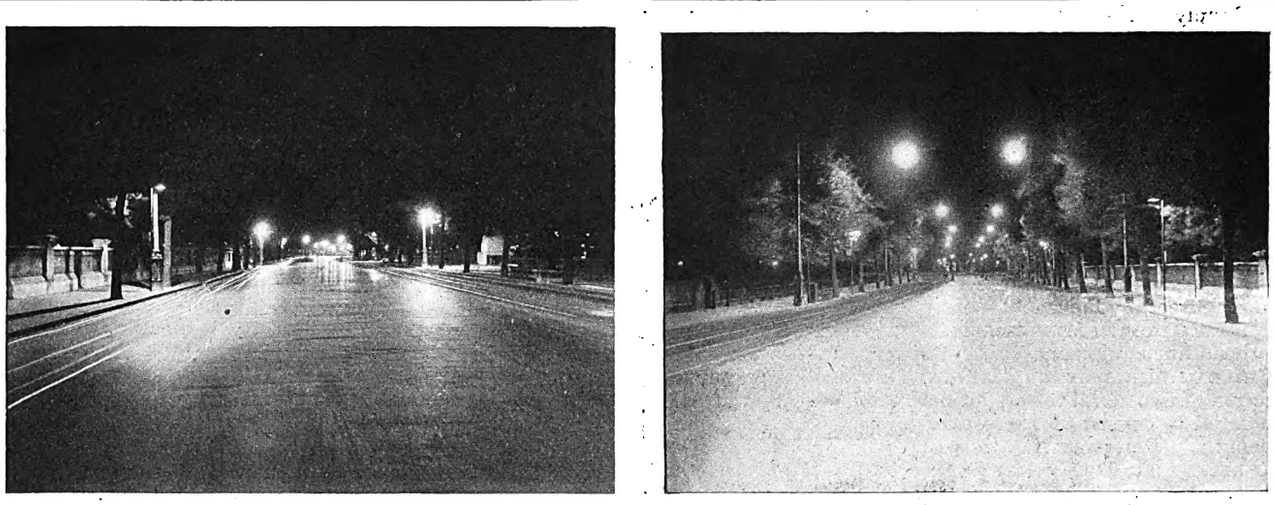
CHILEAN STATE RAILWAYS, August 16th.—Supply of instruments of staff or tablet type, for installation at 36 stations between Alameda and Talca, locking apparatus for switches, batteries and telephone combinations. (Specification C. 3 070*.)

AUCKLAND ELECTRIC POWER BOARD, August 19th.—Single-phase transformers. (Reference B.X. 5 324.)



THE Metropolitan-Vickers lighting installation on the Wembley Stadium Co.'s speedway. The white sheet covering the greyhound track, to prevent cinders getting on the grass, rather detracts from the photograph, as it has the tendency of making the track look less brilliantly illuminated than it really is. The centre of the field, however, affords the real contrast.

Digitized by Google



THE first five spans of the new Thames Embankment lighting at Westminster were completed by the General Electric Co., Ltd., on Saturday, June 29th. The new installation consists of five spans of twin overhead units comprising "Wembley" lanterns equipped with 1 500 W gasfilled lamps. These are suspended in pairs at 140 ft. intervals along the roadway, 30 ft. from ground level. The right-hand illustration, reproduced from a photograph taken at midnight, shows the intense lighting given by these new lanterns, while the left-hand picture shows the old lighting seen from the same position in the opposite direction. (See page 35.)

GREY ELECTRIC POWER BOARD, August 27th.—Supply and erection of generating plant, for the Arnold river hydro-electric scheme. (Reference B.X. 5 422).

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, August 27th.—Supply of cord type switchboards (schedule C. 448). (Reference B.X. 5 428).

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 7th.—Supply of v.i.r. wire. (No. P. and T. 151/1 573). (Reference B.X. 5 416).

LOURENCO MARQUES PORT AND RAILWAYS, September 11th.—Battery tractors and trailers. (Reference A.X. 8 172).

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply, erection and maintenance of coal conveying plant. Specification (No. 29/68) from the Agent-General, Victoria House, Strand, London, W.C.; deposit, £2 2s.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 15th. Seven 5 500 kVA single phase auto-transformers, with accessories, for Waitaki power scheme. (Reference B.X. 5 417).

Tenders Accepted.

NEWARK URBAN DISTRICT COUNCIL.—Macintosh Cable Co., Ltd., supply of cable, £507.

MACCLESFIELD GUARDIANS.—V. Brees, electric light and bell installation at casual wards, £58 16s.

BEWDLEY CORPORATION.—Hawkins Bros., installation of electric fittings at the Town Hall, £14 18s. 6d.

HULL MATERNITY HOME AND INFANTS' HOSPITAL.—A. Shaw and Son, electric light and bell installation, £2 079.

REIGATE JOINT HOSPITAL BOARD.—Tamplin and Makovski, Ltd., for extension of electric light system, £24 12s. 6d.

SOUTHPORT EDUCATION COMMITTEE.—McGoff and Vickers, Ltd., electric light re-wiring at Holy Trinity Schools, £169.

WATCHET URBAN DISTRICT COUNCIL.—Minehead Electric Light Co., public lighting, £3 per lamp per season, for five years.

CHERTSEY GUARDIANS.—Electric Supply Co., Ltd., electric light installation at the institution, £525 (36 tenders received; highest £1 600).

READING GUARDIANS.—S. E. Bradley, supplying and fixing eight Philips all-mains wireless receivers, £142, and yearly maintenance, £5.

METROPOLITAN ASYLUMS BOARD.—Holbrook and Tattersall, Ltd., electric lighting installation at The Hostel, £243 10s. (Recommended.)

GLASGOW CORPORATION.—Electric Construction Co., Ltd., motors for saw mill machinery; Tudor Accumulator Co., Ltd., renewal of battery.

LARNE GUARDIANS.—J. S. Loughnan, electric light installation in connection with conversion of workhouse buildings into a district hospital, £382.

WEST LANCASHIRE RURAL DISTRICT COUNCIL.—Electric lighting scheme for parish of Aughton: W. T. Henley's Telegraph Works Co., Ltd., cables, £13 350; British Insulated Cables, Ltd., meters, as per schedule.

HULL CORPORATION.—Clarke and Graham, standard electric lamps at list prices less 25%; General Electric Co., Ltd., bus lamps at list prices less 27%; Clarke and Graham, wiring pavilion at Tilworth Grange, £118.

LIVERPOOL CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply and erection at Clarence Dock power station of 50 000 kW maximum continuous rating, turbo alternator, with accessories, £193 370. (Recommended.)

SWANAGE URBAN DISTRICT COUNCIL.—Swanage Gas and Electric Co., electric light installation in the town hall, £75. Also tendered: Aish and Co., £84; Wright and Pull, £68; J. Parsons and Son, £91; E. H. Vivian, £98; S. T. Meggitt, £100.

MIDDLESBROUGH CORPORATION.—Supply of cables, for 12 months: British Insulated Cables, Ltd., and Macintosh Cable Co., Ltd. Meters, for 12 months: Ferranti, Ltd., Chamberlain and Hookham, Ltd., and Metropolitan-Vickers Electrical Co., Ltd.

SPALDING URBAN DISTRICT COUNCIL.—Crompton Parkinson, Ltd., 500 kVA step-up transformer, £278 18s., and kiosks, £402 and £425; Pirelli-General Cable Works, Ltd., 0·01 cable, £258; 0·06 cable, £221; W. T. Henley's Telegraph Works Co., Ltd., boxes, £41 0s. 8d.; Overhead, Ltd., pole line, £60.

REIGATE RURAL DISTRICT COUNCIL.—County of London Electric Supply Co., Ltd., underground main and accessories for supply of electricity for power to the Merstham outfall works, £51 2s. 9d.; Gwynnes Pumps, Ltd., supply of pump, 8½ H.P. motor, and air brake star-delta starter, £88 3s., and valves, £9 0s. 6d.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Hackbridge Cable Co., Ltd., supply of l.t. cables, £4 359. (Recommended.) Also tendered: Siemens Bros. and Co., Ltd., £4 442; Standard Telephones and Cables, Ltd., £4 552; Pirelli General Cable Works, Ltd., £4 597; British Insulated Cables, Ltd., £4 602; Croydon Cable Works, Ltd., £4 915.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Metropolitan-Vickers Electrical Co., Ltd., 1 000 kW motor-convertor, for Grafton Road sub-station, speed 1 000 r.p.m., three plain bearings, £2 543; 750 r.p.m., three plain, £2 740; 750 r.p.m., two plain, £7 740; 750 r.p.m., two roller, £2 740 (Recommended); 600 r.p.m., two plain, £2 950; 600 r.p.m., two roller, £2 950.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—W. H. Allen, Sons and Co., Ltd., supply of electrically driven condensing water pump to deal with 1 500 000 gallons of water per hour, £2 050. (Recommended.) Other tenders: Gwynnes Pumps, Ltd., £2 124; English Steel Corporation, Ltd., £2 144; Brush Electrical Engineering Co., Ltd., £2 145; Escher, Wyss and Co., £2 188; Rees Roturbo, Ltd., £2 206; General Electric Co., Ltd., £2 223; Drysdale and Co., Ltd., £2 273; Tangye's, Ltd., £2 430; Mirrlees, Watson Co., Ltd., £2 480; Mather and Platt, Ltd., £2 594; Worthington-Simpson, Ltd., £2 728; Lilleshall Co., Ltd., £2 980.

WORK IN PROSPECT.

ASHTON-UPON-MERSEY.—Houses, Green Lane. Particulars, the architects, Matley, Brotherton and Mills, Court Chambers' Old Millgate, Manchester.

BATLEY.—Sunday schools. Particulars, Messrs. C. H. Marriott, Son and Shaw, Church Street Chambers, Dewsbury.

BEDFORD.—Houses. Particulars, Mr. F. R. Chapman.

BEWDLEY.—Houses. Particulars, from Messrs. Gething and Rolley, Kingsley Hall, Kidderminster.

BEXLEY.—Additional 50 houses, Brampton Estate, for the Urban Council. Particulars, the Surveyor.

BIRKENHEAD.—School. Particulars, Tyson's, Ltd., Liverpool.

BOURNE.—Picture house. Particulars, Mr. A. J. Thraves, 12, Victoria Street, Nottingham.

BRIGHTON.—Extensions, Brighton College, to cost £12 000. Particulars, Messrs. Longley, Crawley.

BUCKHURST HILL (ESSEX).—Extensions to Forest Hospital. Particulars, the Secretary.

CHIGWELL (ESSEX).—School extensions. Particulars, the Clerk to the Governors.

CHIPPING NORTON.—Maternity ward. Particulars, Mr. Fred E. Openshaw, 65, St. Giles' Street, Oxford.

COOKHAM.—Houses. Particulars, Messrs. Canning and Sargeant, Wokingham.

COVENTRY.—Works, Stoke Heath, for the National Cork Industries, Ltd.

DARLINGTON.—Chapel. Particulars, the Borough Surveyor.

DEWSBURY.—Girls' secondary school. Particulars, from Borough Surveyor.

DONCASTER.—Housing scheme (36). Particulars, Mr. W. R. Crabtree, Nether Hall.—Extensions, Girls' school. Particulars, Mr. J. B. Richardson, 26, Printing Office Street.

DORKING.—Secondary school. Particulars, Mr. W. W. Finny, Kingston-on-Thames.

EASTLEIGH (HANTS). — Club, for Usher's Brewery, Trowbridge.

EWELL. — Houses, for the Allied Building Corporation, Newport, Mon.

FRESHWATER (ISLE OF WIGHT).—Re-erection of the Palace Theatre. Particulars, Mr. W. B. Barnard.

GRAYS. — Intermediate schools to cost £28 000. Particulars Mr. J. Stuart, Chelmsford.

GRETTON.—Houses. Particulars, Mr. George Dolphin, North Street, Uppingham.

HOVE.—Ice rink, to cost £67 500. Particulars from the Secretary, Ice Rinks, Ltd.

LUMLEY.—School (216 places). Particulars, Mr. F. Willey, 34, Old Elvet, Durham.

MIDDLESTOWN.—Shops and village Hall. Particulars, Mr. S. P. Fairhurst, East Thorpe House, Mirfield.

NORTHAMPTON.—Houses (45). Particulars, A. Glenn and Son, Ltd.

NORTHENDEN. — Housing scheme (34). Particulars, Mr. R. C. Cordon, 24-26, Station Buildings, Altrincham.

PRESTON.—Sunday schools to cost £16 000. Particulars, G. Hill and Son, Ltd.

READING.—Casual wards. Particulars from the Clerk to the Board of Guardians.—Housing scheme. Particulars from the Borough Surveyor.

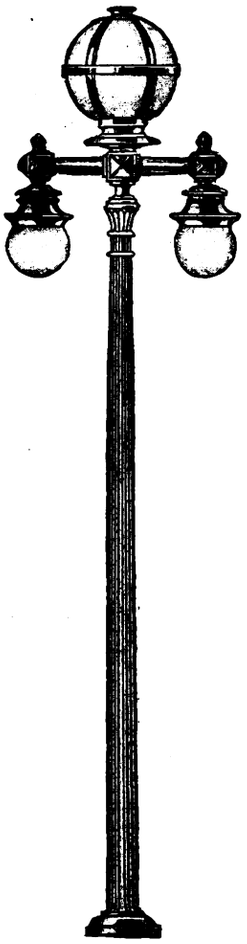
REDHILL. — 28 houses. Particulars, the Borough Surveyor, Reigate.

RYDE. — Reconstruction, Royal Isle of Wight County Hospital. Particulars, Messrs. John Seely and Paul Paget, 3, Queens Square Place, Queen Anne's Gate, London, S.W.

SIDMOUTH. — Market buildings to cost £3 300, for the Urban Council. Particulars, Mr. R. G. Spiller, Chard.

SMETHWICK.—Extensions, Holly Lane Hospital. Particulars, the borough engineer, Mr. R. Fletcher.

SUTTON (SURREY). — Houses (41), Green Lane, Worcester Park, for Messrs. Shuttleworth.—Houses (15), Westfield Road, for Mr. C. H. Runnalls. — Houses (22), Morden Way, for Braddy and Randall.



AN example of the lighting standards used in the grounds at the North-East Coast Exhibition. They are of B.T.-H. design and manufacture.

TRADE PUBLICATIONS.

BRITISH INSULATED CABLES, LTD., Prescot, have issued a new wire list in pocket form, complete with voltage drop calculator.

List No. X. 64/283, dealing with ironclad distribution fuse boards, has been received from the HARLAND ENGINEERING CO., LTD., of Manchester.

The JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, London, S.W.1, has published a leaflet describing a model luncheon club with an electric cooker.

The TUNGSTEN ELECTRIC LAMP WORKS (GREAT BRITAIN), LTD., 72, Oxford Street, London, W.1, have issued two leaflets relative to automobile and "D" gasfilled lamps respectively.

CALLENDER'S CABLE AND CONSTRUCTION CO., LTD., Hamilton House, Victoria Embankment, London, E.C.4, has issued a revised price list dealing with rubber insulated wires and cables.

The DRAYTON REGULATOR AND INSTRUMENT CO., LTD., of West Drayton, Middlesex, has published L. 113 dealing with liquid level regulators, and L. 122 describing the double relay pressure regulator.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, has issued an illustrated brochure entitled "G.E.C. Street Lighting Practice," and an illustrated leaflet, "Illumination of Laundries."

BRITISH INSULATED CABLES, LTD., Prescot, have issued C. 101 entitled "Copper Weld," which describes a product consisting of a core of tough steel on to which is welded a heavy layer of electrolytic copper.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, have published a new automobile lamp price list, reference No. 213. Leaflet No. 173 relating to "Duo-Tanclite" lamps has also been issued.

The IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C., has issued leaflet No. 1 701, relative to solenoid operated brakes for a.c. and d.c., type R.M.

An additional sheet for attaching to Section K of the catalogue recently issued and dealing with lighting accessories has been published by JULIUS SAX AND CO., LTD., West Lodge, 27, Lower Mall, London, W.6.

BRITISH INSULATED CABLES, LTD., Prescot, Lancs, have published a special circular dealing with pliable armoured cables, booklet P. 245, relative to electric resistance welders, spot welder section, and P.244, dealing with the seam welder section. P.245 replaces P.235.

List N.T.L. No. 8, giving nett prices and data of "Enfield" C.M.A. and Nonazo v.i.r. cable and wire, and list T.P.L. No. 7, dealing with "Enfield" v.i.r. and pure rubber flexibles have been published by the ENFIELD CABLE WORKS, LTD., Lincoln House, 296/302, High Holborn, London, W.C.1.

J. H. TUCKER AND CO., LTD., King's Road, Tyseley, Birmingham, has issued folder S. 9, dealing with ironclad gear; C. 2, describing flush tumbler switches, bell pushes and boxes; A. 5, concerning "Telacite" lampholders and switch-lampholders; and B. 10, devoted to a description of 15 A 250 V 3-pin switch socket.

J. J. EASTICK AND SONS, of Eelex House, 118, Bunhill Row, London, E.C., have published a new general catalogue of wireless and electrical specialities, which comprises some 250 pages. The list is arranged in alphabetical order under main headings and represents a ready reference to practically every type of component and accessory on the market.

A catalogue containing 25 pages of information relative to lampholders has been published by the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2. The catalogue shows in many instances substantial price reductions and includes details of a range of porcelain and bakelite lampholders. The former are made in B.C., E.S. and G.E.S. types in various patterns to cover all requirements, including the equipment of lanterns and reflectors for modern lighting conditions.

ELECTRICITY SUPPLY.

Bulk Supply for Walton-on-the-Naze—Newry's New Generating Station—Wandsworth to Press for Reduction of Flat Rate—Hire and Hire-purchase Scheme for Hull—Switchgear Required at Eastbourne.

CHELTENHAM Electricity Committee seeks sanction to borrow £10 000 for mains and services.

Manchester Electricity Committee recommends that sanction be sought for a loan of £7 000 for h.t. mains.

Walton-on-the-Naze U.D.C. has intimated that it is prepared to accept the terms submitted by Colchester T.C. for a bulk supply.

Beckenham U.D.C. has decided to have the battery of accumulators used in connection with the tramway supply renewed, at an estimated cost of £3 060.

Maidstone Electricity Committee is to apply to the Electricity Commissioners for sanction to borrow £11 683 for the purpose of supplying electrical energy to Malling district.

Acting on the advice of Mr. E. G. Phillips, consulting engineer, Leicester Health Committee proposes to instal two 75 kW generating sets, with the necessary switchgear, etc., at the isolation hospital and sanatorium, at a cost of £1 982.

Westminster Works Committee reports that it is proposed to control the sixteen 500 W lamps at Grosvenor Wharf with a selenium cell and a meter, which will register any hours of lighting above those agreed, viz., 3 949 hours per annum.

Halifax Electricity Committee is extending the heating and cooking tariff to embrace the heating of buildings used for commercial purposes. The charge for the first 160 kWh per quarter per kW of maximum demand, supplied through a separate meter, is 1½d. per kWh and any further consumption ½d. per kWh.

Chelmsford Electricity Committee recommends approval of a suggestion that the Electric Supply Corporation should carry out the conversion of the electricity supply in the town from 100 to 50 cycles at its own cost, such cost being put to a special account and reduced by a sinking fund, based on 5% contributions and 5% interest.

Brighton Electricity Committee has obtained sanction to borrow £7 608 for works in connection with the installation of a new 1 500 kW convertor and accessories at North Road sub-station. The borough electrical engineer (Mr. John Christie) and the borough accountant are to report fully upon the question of introducing a two-part tariff.

Viscount Craigavon, Prime Minister of Northern Ireland, formally opened Newry Urban District Council's new electricity works on June 26th. The generating plant comprises two 80 B.H.P. twin-cylinder vertical type oil engines, each coupled direct to a 44 kW three-phase alternator. There is also a four-cylinder 160 B.H.P. oil engine of the same make and design, direct-coupled to an 88 kW alternator.

Walton U.D.C. is applying to the Electricity Commissioners for sanction to loans of £4 000 for mains and services and £1 000 for meters, and the engineer and manager, Mr. E. A. Anderson, and the consulting engineer, Mr. A. H. Dykes, are to interview representatives of the Commissioners with regard to the borrowing of the balance of the £20 000 originally applied for in connection with the development scheme.

The scheme for supplying electricity to Chieveley was explained by Mr. A. J. Bridge, development manager, Wessex Electricity Co., at a recent public meeting in the schoolrooms, Chieveley. Mr. Bridge gave some details of the national electricity scheme, and an explanation of the uses of, and the charges for, electricity in the home, factory and farm. The meeting gave unanimous support to the scheme.

Wandsworth (London) B.C. Special Electricity Committee reports that in view of the very moderate proportion of the consumers of the borough who have elected to take advantage of the County of London Co.'s new tariffs, and in view of the fact that the company has given no assurance that it will consider any modification of its flat rate charge, the Committee feels that there is no alternative but to recommend the Council to press for the reduction to 4d. per kWh at the resumption of the adjourned inquiry.

Barking U.D.C. is to ask London County Council to bear the cost of erecting 114 lamp standards and fittings for street lighting of the Barking Section of the Becontree Estate, at an estimated cost of £8 12s. 6d. per column.—The L.C.C. has agreed to undertake the wiring of the houses now being erected by it in Barking.—Barking Electricity Committee recommends the scheme of the Fixed Price Light Co. for wiring and lighting small houses at a fixed price per lamp per week, the company taking a bulk supply from the Council at £5 5s. per kW connected, plus 0·8d. per kWh in selected areas of the town.

Newbury Corporation recently accepted a tender by Messrs. Hathorn, Davey and Co. for an electric pumping set to deal with the storm water at the sewage pumping station. The Committee has since favourably considered a report by Messrs. Howard Humphreys and Sons upon the question of the conversion to electric drive of the whole of the plant, and recommends that application be made for sanction to the borrowing of £1 800, the estimated cost of the work of conversion. The Committee also recommends a five years' agreement with the Urban Electric Supply Co. for a supply. The company agreed to supply electricity for driving the storm pumping set at 2d. per kWh, but for the whole of the pumping the charge would be 1½d. per kWh.

Mr. J. N. Waite, city electrical engineer, Hull, has reported that he desires to introduce a scheme of hire and hire-purchase of cookers and other domestic apparatus. The preliminaries are being completed, and tests of various types of cookers and other apparatus are taking place. The cooker scheme would include free maintenance and repair during the period of hire, and the necessary wiring and installation. The majority of the installations would be carried out to the department's specification at an agreed rate by approved contractors, and the repair and maintenance by the department's own staff. Mr. Waite recommends that, as a commencement, £25,000 of the reserve fund should be allocated for this purpose. The Electricity Committee has adopted the scheme.

Southwark (London) General Purposes Committee has reported on the question of increasing the charges for the administration of the electricity supply undertaking. At the present time the undertaking contributes £750 per annum for administrative expenses, in addition to an annual sum of £988 9s. 9d. for salaries of officers at the town hall engaged on accountancy work. The Committee is of opinion that any special services rendered by the borough engineer's department should be paid for by the undertaking, and that in future all architectural engineering or other work carried out for the electricity supply undertaking by the borough engineer's department should be paid for by the undertaking at the rate of 8% of the cost of the work or works involved.

Preston electricity department is to erect a 6 600 V overhead main from Hall Cross to Wrea Green, with a sub-station at Wrea Green, at a cost of £5 820, and application is to be made for sanction to borrow the money. The main transmission line between Blackburn and Preston will be required by the Central Board for the national scheme, and the Board is prepared to bear the capital costs relating to it from the appropriate date.

An agreement has now been reached between Blackburn Corporation and the Central Electricity Board concerning the terms on which the Whitebirk generating station will be taken over. The Board has decided that, while it cannot take over Whitebirk as a selected station owing to legal difficulties, it is prepared to pay 60% of the capital charges. This will mean an estimated gross saving to Blackburn of £20 500 per annum up to the year 1934–5.

In regard to the supply of electricity to be taken by Eastbourne Corporation from the national grid, it has been decided that four or five of the leading British manufacturers be asked to tender for the first portion of the switchgear required.—In reply to questions that have been put to him, the consulting engineer (Mr. W. C. C. Hawtayne) states that the total estimated additional cost of placing underground the 33 000V regional transmission lines in the areas proposed to be included in the new Order—approximately 16 route miles—allowing for increasing copper section from 0·10 sq. in. to 0·15 sq. in., would be £67 200. The 11 000 V mains are outside the borough, and (if they are as shown on Plan E.E.2) the additional cost of placing these underground will be in the neighbourhood of £17 500, allowing for increase of copper section to 0·15 sq. in. The Electricity Committee recommends the Council to bear the extra expense (estimated at £4 200) to place the 33 000 V transmission lines underground as far as the borough boundary only.

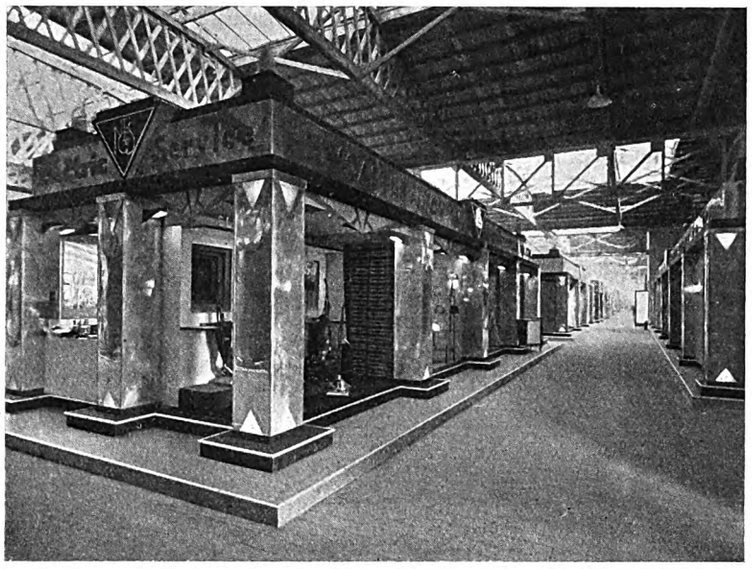
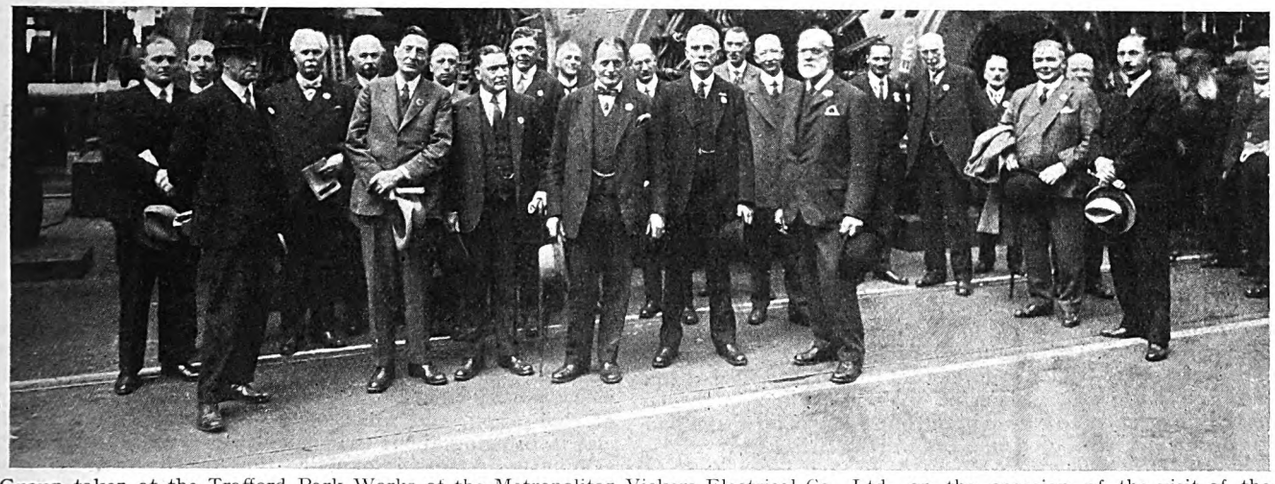
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

On Saturday, June 29th, the first five spans of the new Thames Embankment lighting at Westminster were switched on by Sir George Humphreys (left), chief engineer of the L.C.C., supported by Mr. C. A. Baker, divisional engineer, L.C.C., Mr. W. B .Thorpe, engineer-in-chief, Charing Cross E.S. Co., and Mr. W. J. Jeffries, mains engineer of the same company, all seen here to the right of Sir George.



A general view of the Newcastle-upon-Tyne E.S. Co.'s exhibit at the North-East Coast Exhibition. The columns and fascias of the stands are made of polished aluminium, and the lettering is illuminated by three-colour lighting. On the corner columns are boxes in which are 12-in. fans which keep in motion pieces of orange-coloured silk and produce flame-like effects. Amber lights in the boxes add a further touch of realism. Various tableaux on the stand include "Bruce and the Spider," "Alfred and the Cakes," the "North Pole" complete with Aurora Borealis and the "Evolution of Light." The exhibit covers no less than 3 500 square feet.



Group taken at the Trafford Park Works of the Metropolitan-Vickers Electrical Co., Ltd., on the occasion of the visit of the Institution of Mechanical Engineers last week. The photograph shows the President of the Institution, Mr. Daniel Adamson, past Presidents, vice-Presidents and Members of Council, together with Sir Philip A. M. Nash, chairman of the company. Following a tour of the works, the visitors were entertained to a luncheon, at which Mr. Adamson presided. Sir Philip Nash, in the course of a speech in which he proposed the toast of "The Institution," made a statement to the effect that last year, while his company had over 30 000 orders, some running into hundreds of thousands of pounds, the average value of each order was £115. They supplied plant to 22 different countries, and this not only involved the difficulty of dealing with nearly 22 different mentalities, but involved the somewhat arduous business of dealing with some 15 different governments. See page 38.

Burnham-on-Crouch U.D.C. has received a copy of the Burnham and District Electricity (Amendment) Order which the Commissioners propose to make, and which provides for the transfer of the undertaking from Dr. J. A. Purves to the County of London Electric Supply Co.

The Borough Surveyor and Electrical Engineer have reported to Tynemouth Electricity Committee with regard to experiments with 300 and 500 W lamps on the thoroughfares between the Coast Road and Tynemouth. It has been decided to substitute 500 W lamps for 200 W lamps at road junctions and other main points when necessary, and generally to substitute 300 W lamps for the present 200 W lamps.

Stoke-on-Trent Electricity Committee seeks sanction to borrow £2 500 for the erection and equipment of a sub-station in Campbell Road, Stoke. In accordance with the undertaking given to the Electricity Commissioners, the Electricity Committee has instructed the Engineer to proceed with the erection of the secondary transmission lines necessary to give supply to Whitmore pumping station and the Market Drayton Electric Light and Power Co., at a cost of £50 000. An experiment made to ascertain the consumption and load factor of supply to tubular heaters used to heat sanitary ware drying shops has shown that 7 kW had taken 17 077 kWh in four months, giving a load factor of 83%. The Committee has decided that for electric kiln and pottery drying, with maximum loads of less than 20 kW, the rate be 1d. per kWh with 50% load factor, falling by 0·1d. for each increase of 10% in load factor.

ELECTRIC TRACTION.

Further Developments of the Southern Railway Electric System.

THE directors of the Southern Railway have sanctioned an expenditure of £597 000 on further extensions of their suburban electrified system. The new sections for electrification are (*a*) Hounslow Junction and Whitton Junction to Windsor, (*b*) Dartford to Gravesend, and (*c*) Wimbledon to West Croydon. It is hoped that most, if not all, of the work will be completed in time for next year's summer service. The work will provide considerable orders for British firms. On the new electric lines there will be a service of trains in each direction every 20 minutes during busy periods and every 30 minutes at other times. These extensions will increase the Southern Railway suburban electric system to 800 track miles. Passengers carried in the electrified areas last year were 6½ million more than in 1927, and in that year the increase was 11½ millions over 1926. Further extensions are under consideration.

The tramway service of Wiesbaden (Germany) was discontinued recently, owing to the refusal of the municipality to renew the concession. This is the first of the larger German towns to abolish its tramways.

Manchester Tramways Committee recommends that 50 of the Corporation's existing electric tramcars be equipped with interior upholstery, improved lighting, and seats for the drivers.

The last of the Wolverhampton tramway routes has now been converted to the railless trolley system. The Corporation's trolley vehicle services now cover 25 miles of route.

Doncaster T.C. has decided to convert three tramway routes to the trackless trolley system, with an extension along Carr House Road to connect with the Racecourse route.

Of 101 new cars ordered for the District Railway (London) 25 are now in service and the remainder are being delivered at the rate of three a week.

THE JOHN BENN HOSTEL.

Annual Dinner at Savoy Hotel—Sale of a Wells Manuscript.

THE annual dinner of the East End Hostel Association took place on June 25th at the Savoy Hotel, London, Lord Melchett presiding over a numerous company.

Sir Tudor Walters, M.P., proposing the toast of "The London Boy," said he was of opinion that the London boy comprised probably the finest human raw material in the world. He possessed many distinctive qualities, and the most notable was his alertness. The spirit that pervaded the John Benn Hostel made for a new England. The boys themselves contributed £2 200 annually towards its upkeep. The courage and determination of the London boy conquered the whole world. He could turn his hand to anything, and knew not the maxim of "one man one job." During the war he had a record of which any race might well be proud.

The Dean of St. Paul's, in support of the toast, said that the institution was doing wonderful work, though it might be said that it was a mere "drop in the bucket." The hostel had turned out scores of good men and worthy citizens.

The Rt. Hon. Wedgwood Benn, M.P., Secretary of State for India, responding, said the London boy was the enemy of pomposity and sham. He gave real friendship in return for friendship that was offered on terms of equality.

Proposing "The John Benn Hostel," the chairman said it was founded in memory of Sir John Benn, and was being supported and carried on to-day by Sir Ernest Benn. It formed an example which should be extended and followed. Besides the £2 000 that the boys contributed, another £4 000 was needed to make up the running expenses. They hoped to raise that night at least £2 000 by contributions. He would be glad to contribute £100 towards the fund.

Lord Feversham, who acknowledged the toast, advised those who had not yet visited the hostel to follow the lead of the Prince of Wales and make practical acquaintance with its activities in the premises at Stepney.

During the evening Sir Ernest Benn sold by auction Mr. H. G. Wells's MSS. of "Aepyornis Island," which realised £950, and was knocked down to Mr. Gordon Robbins, acting on behalf of an undisclosed bidder. Sir Ernest said the manuscript was written in 1894 and was published for a fee of nine guineas in the "Pall Mall Budget." Any publisher in London to-day would gladly pay 1000 guineas for a like privilege.

DISPLAY CONVENTION.

Opportunity for Electrical Contractors to Air their Views on Window Display.

ELECTRICAL installation contractors and electricity supply authorities, who are now taking a more active part than heretofore in the organisation or encouragement of window displays, will be interested to know that the British Association of Display Men will hold its convention this year at the Central Hall, Westminster, from September 9th to 11th, inclusive. The four previous conventions have shown display men the beneficial information and the knowledge that is to be obtained from these conferences, and the forthcoming conference—the first of its kind to be held in London—will surpass all its predecessors. The three days will be filled with a variety of lectures, demonstrations and social events, all calculated to help in the furtherance of the art and practice of window display. The British Association of Display Men, knowing who are the best demonstrators and lecturers on window display, will arrange for experts to deal with the respective subjects appearing in the programme. Apart from the value of the conferences, there is the opportunity to enter into fraternal intercourse and the exchange of ideas with one's fellow-craftsmen from all parts of the country. This side of the Convention will be much encouraged, for a mutual deliberation of common problems is bound to be beneficial to all concerned. When it is realised that the Display Conventions in the past have attracted delegates from as far north as Aberdeen and as far south as the Channel Islands, it will be realised that their influence is wide and far-reaching. The Convention will open at 10 o'clock on Monday morning, September 9th, and continue till the night of September 11th. A dinner will be arranged, at which it is hoped all delegates and all London display men will be present.

The Convention is open to members and non-members of the B.A.D.M. The registration fee will be 5s. per delegate, and 2s. 6d. each for the wives of delegates. Badges will be supplied, and must be worn to gain admission to the conference hall. The dinner will take place on the evening of September 9th. Registration forms from the Secretary, 43, Blandford Street, London, W.1.

INDIVIDUALIST BUYING.

American Views on the Hire-purchase Method of Trading.

AT the 26th Individualist luncheon, held at the Hotel Cecil, London, on June 19th, Prof. Edwin R. Seligman, who occupies the Chair of Economics at Columbia University, New York, addressed a large gathering of professional and business men on the subject of "Instalment Buying." The Right Hon. Sir Donald Maclean, M.P., presided.

Prof. SELIGMAN stated that the prevalent and growing system of purchasing articles and goods of all descriptions by deferred payments formed the foundation of a great fundamental economic development which would eventually enable every worthy citizen to take his rightful place in the progress of civilisation, and which would assist more than anything else in bringing about that equality of wealth and participation in the advantages of civilisation for which they all hoped.

The more modern analysts had come to the conclusion that the former distinctions between productive and unproductive credit were inadequate, and had now substituted for them the theory of utilisation. Financing the consumer was, in the long run, the same as financing the producer, since it encouraged increased consumption, to meet which further production was necessary.

With regard to the objection that the instalment system, while permissible when applied to the purchase of necessities, encouraged extravagance and the use of luxuries to an unjustifiable extent, it was essential to realise just what was meant by a luxury, for the whole modern theory of social development was disposed to wipe out the distinction between luxuries and necessities. In any country that was making headway the luxury of yesterday was the comfort of to-day and the necessity of to-morrow.

As regards the manufacturer, one beneficial effect of instalment buying had been to equalise production throughout the year and eliminate seasonal fluctuations. In the United States a scheme was being investigated by which the instalment plan would become applicable to capital investment.

A vote of thanks was proposed by Mr. Harold Cox and seconded by Mr. John Benn.

COMPANY NEWS.

Electricity Supply and Traction Descriptions Remain Quiet—Manufacturing and Telegraph Holdings Mainly Steady—Market Generally Uninteresting—Dubilier Condenser Co. Negotiating Amalgamation.

THE market for electrical securities—supply, transportation, equipment and telegraph—has remained quiet during the past week. The favourite manufacturing shares have given way a little, under the lead of General Electrics, which have fallen 1s. 3d. from 52s. 6d. to 51s. 3d. English Electric 6% preference have dropped from just over 8s. to 7s. 6d., Siemens shares are 7½d. down at 30s., and Ever Readies and British Thomson-Houston preference, at 21s. 3d. and 23s., are each 3d. easier. Marconi's International Marine shares are half-a-crown lower at 62s. 6d. County of London Electric Supply ordinary shares are 6d. to the good, at 56s.

NOTTING HILL ELECTRIC LIGHTING CO., LTD.—Intm. div. of 5s. p. sh., less tax, on dfd. shs. of 1s. each will be payable on July 31.

EASTERN TELEGRAPH CO., LTD.—Div. at rate of 3½% p.a., less tax, on pref. stk., for qrtr. ended June 30, will be payable on July 15.

ST. JAMES' AND PALL MALL ELECTRIC LIGHT CO., LTD.—Intm. divs. at rate of 8·4d. p. sh. on £1 pref. shs. and 9d. p. sh. on £1 ord. shs. will be payable on July 27.

KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING CO., LTD.—Intm. div., on acct. of year endg. Dec. 31 next, of 9d. p. sh., less tax, on ord. shs. will be payable on July 20.

ELECTRIC AND GENERAL INVESTMENT CO., LTD.—Net pft. for year ended May 31, 1929, £10 221, agst. £8 016, plus £47 474 brt. in. Div. on ord. shs. 10% for year and on 1s. dfd. shs. 100%. To res. £18 538. Fwd. £20 024.

EDMUNDSON'S ELECTRICITY CORPORATION, LTD.—Extraordinary mtg. will be held today (July 5th) to consider a resolutn. to increase cap. to £3 150 000 by creatn. of a further 1 500 000 £1 ord. shs., with a view to acquisitn. of not less than 90% of issued sh. cap. of East Anglian Electric Supply Co. and Wessex Electricity Co. and investmts. in other electy. supply cos.

W. T. HENLEY'S TELEGRAPH WORKS CO., LTD.—Net pft for year ended March 31, 1929, £294 237 agst. £283 074, plus £529 931 was brt. fwd. Allowing for income tax (£27 257), pref. and int. ord. divs., and transferg. £50 000 to res., blce. is £691 530. Fin. div. of 2s. 6d. p. sh. is proposed on ord. shs., with bonus of 2s. p. sh. makg. total distributn. for 30% for year (agst. 25%). Fwd. £545 280.

ARON ELECTRICITY METER, LTD.—Pft. for past year, £6 594. Div. of 3% actual has been paid on cum. pref. shs., leaving £4 275. Directors recommend fixed div. of 6% p.a. on converted cum. pref. shs. for period from Oct. 1, 1928, to March 11, 1929, and 6% p.a. on 6% income deb. stk. for period from March 12, 1929, to March 31, 1929. No div. recommended on ord. shs. Fwd. £1 795.

WARD AND GOLDSTONE, LTD.—Net pft. for year ended March 31, 1929, £13 824, agst. £13 901. Directors propose to capitalise £8 000 for purpose of issuing 32 000 fully-paid ord. shs. of 5s. ea. to hldrs. of pref. shs, to pay fin. div. of 4% on ord. shs, agn. makg. 11%, and to pay fin. participatg. div. of 1% on cum. pref. shs., agn. makg. 8%. Fwd. £25 668, agst. £29 805.

LAMP MANUFACTURERS' WORKING AGREEMENT.—An agreement has been reached between the General Electric Co. of New York and the German Osram Trust, the incandescent lamp co. controlled by Siemens, the A.E.G. and Koppel and Co. The General Electric Co. has acquired 16% of the Osram shs., and agreemt. provides for technical and commercial co-operatn. The Osram Trust is a member of the international consortium of incandescent lamp mfrs., which extends to 18 countries.

DUBILIER CONDENSER CO. (1925), LTD.—Net pft. for year ended March 31, 1929, £15 946, agst. £33 331. Taxatn. absorbed £4 900, agst. £4 917. Half-yearly div. on pref. shs. paid on Nov. 30, 1928, absorbed £6 000, and, after paymt. of half yearly div. on pref. shs. due May 31, 1929, blce. is £11 052, agst. £12 006 brt. in. During year claim by Inland Revenue was decided agst. co., and £9 856 was paid in settlemt. and charged to cap. res. Mfrs. of broadcast receivg. sets have approached the co. with a view to amalgamation, and negotiatns. are proceedg.

EDMUNDSON'S ELECTRICITY CORPORATION, LTD.—Net pft. for year ended March 31, £149 272, agst. £125 083, plus £39 388 brt. in. During year cap. bonus equal to 150% was distributed to ord. shhldrs., increasing issued ord. cap. by £600 000, while a further 250 000 £1 ord. shs. were issued to ord. shhldrs. at par. Fin. div. of 4½% proposed on 1 000 000 ord. shs., makg. 8% for year, with div. of 4% on the 250 000 ord. shs. issued for cash. It is proposed to write off cost of increasing sh. cap., £8 501, and to place £25 000 to res. and £3 000 to staff benevolent fund. Fwd. £34 159.

TELEPHONE MANUFACTURING CO., LTD.—Net pft. for 1928, £20 220, agst. £35 234. It is proposed to utilise £10 000 in writing down new issue exes., and to carry fwd. £34 787. Unremunerative prices on mfg. side have continued, and, in

Digitized by Google

spite of increase of 80% in output, operatn. of this dept. resulted in loss of £16 305. Directors have under consideratn. scheme by which installatn. side of business will be formed into a separate co., which, on the pfts. earned, will at once become a div. paying investmt. Particulars of this scheme are to be circulated to shhldrs. at earliest possible date.

OFFICIAL QUOTATIONS.—The Stock Exchange Committee has granted official quotatns. to 316 000 £1, fully paid, ord.

PHOTOGRAPH taken on the lawn at the Sports Ground of the Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester, during the visit of the Institution of Mechanical Engineers on June 25th. (*See page* 35.)

shs. of Callender's Cable and Construction Co., Ltd.; 250 000 £1, fully paid, 7% cum. pref. shs. of the Atlas Light and Power Co.; 333 333 £1, fully paid, ord. shs. of British Insulated Cables Ltd.; 35 000 £1, fully paid, ord. shs. of the Folkestone Electricity Supply Co., Ltd.; 5 025 540 cap. stk., of no par value, of the International Telephone and Telegraph Corporation, and 14 441 £1, fully paid, ord. shs. of the Underground Electric Railways Co. of London, Ltd.

HALL TELEPHONE ACCESSORIES, LTD.—Intm. div. 4%, less tax, has been declared. Business has continued to be satisfactory in all branches, and gen. expansn. has occurred. Benefits of increased trade will accrue mainly in second half of year. No further patents have been sold, but trade under licenses granted in foreign countries has expanded. Indicatns. are that absorptive capacity of various countries served by co.'s. proprietary articles is increasing, and co. has been requested to anticipate dates on certain home contracts. It has been necessary to make additns. to factory premises and to plant and machinery, in order to meet present requiremts.

LISBON ELECTRIC TRAMWAYS, LTD.—After deducting int. charges in connection with the Companhia Carris de Ferro de Lisboa and paying £24 290 int. on debs., net pft. for 1928 was £161 399, plus £17 587 brt. in. To gen. and depreciatn. res., £50 000. Pref. div. and intm. div. of 3% net on ord. shs. have been paid, £10 000 has been transferred to staff benefit fund., and £10 000 to exchange res. Fin. div. of 4% net recommended on ord. shs., making 7% for year. Fwd. £16 880. Passengers carried 112 874 963, compared with 104 581 427.

THE CABLES AND WIRELESS MERGER.—At an extraordinary mtg. of Marconi's Wireless Telegraph Co., Ltd., on June 26th, it was announced that the necessary percentage of assents of all the companies concerned in the merger, Cables and Wireless, Ltd., had been obtained, and the consummatn. and operatn. of the scheme was now ensured. Resolutions approving of the merger were confirmed by the mtg.—On June 27 Cables and Wireless, Ltd., issued a statement that in pursuance of the provisns. of the plan for the merger of the cable companies and the Marconi Co.'s interests and the deposit agreemt. therein referred to, Cables and Wireless, Ltd., certify that the above plan has become operative and that on and after the evening of July 15, 1929, the special register referred to in such plan and deposit agreemt. will be closed. The plan and deposit agreemt. provide that after June 28, no one will be entitled to make a deposit under such deposit agreement or in any other way to accept the offer of exchange contained in the plan, unless the Co. agrees to his so doing. Persons who are desirous of acceptg. the offer after that date should apply in writg. to the Co., who will give them permissn. to accept, subject to such adjustmts. as may be necessary with regard to divs. Notice will be given by advt. in "The Times" and two other newspapers published in London when this permissn. is withdrawn.—The directors of Marconi's Wireless Telegraph Co. recently decided to postpone paymt. of the half-yearly div. on the 7% pref. shs., which would ordinarily be paid on July 1, until the merger plan had become operative and the necessary adjustmts. had been made in the sh. registers.

Company Meetings.

CHADBURN'S (SHIP) TELEGRAPH CO., LTD.—Mr. A. Chadburn Bamford, presiding at the meeting on June 27th, referred with satisfaction to the improved working of the company during the past year, which had enabled them to wipe out the debit balance and show a credit. This more profitable year, he said, had been brought about through increase in sales, and, although the telegraph business was still the mainstay of the company, the directors, for several years, had endeavoured to enlarge their scope of operations so as not to keep their business eggs in one basket. As a result new and additional sidelines were again proving of extreme value to the company. They had secured a valuable order for the manufacture of highly special instruments. The order books were in a healthy condition, with the result they had every reason for expecting the works would be practically fully employed for several months ahead. Trading conditions were still very difficult, competition being as keen as ever. The report was adopted.

GREENWOOD AND BATLEY, LTD.—Col. O. C. Armstrong, presiding at the meeting on Monday, said: The past year's history of the company has beenmore or less a repetition of the preceding lean years which we have been passing through. In spite of seven years' continuous bad trade, we are, however, in a position, subject to your approval, to maintain our dividend on the ordinary shares at the level of 5%. In comparison with last year's figures, creditors stand at £28 101, which is £5 737 more; the reserve account is constant at £162 344. The reserves and surplus of the profit and loss account total £196 000, or 55% of your paid-up ord. sh. capital. The carry forward is £11 396—£2 063 less than last year. On the asset side, after writing off £6 000 for depreciation, we have £385 036. Investments are £21 045 higher than last year, and now stand at £126 179. Stocks are higher by £874. Debtors are £6 288 lower; cash is £11 414 lower. The cash balance, £109 248, is adequate to meet all our present needs. Investments, stocks, debtors, cash, and bills total £380 818. The report was adopted.

LISBON ELECTRIC TRAMWAYS, LTD.—Mr. L. Breitmeyer, presiding at the meeting on June 26th, said the period under review had been one of steady progress, though depreciation of the escudo had caused a falling off in the sterling value of their income of about £22 500, despite the increase of 4 832 contos in the receipts. On the other hand, expenditure showed a decrease of some £22 000. The net result was a profit of £185 689, against £186 416. After deducting interest and redemption of debentures, placing £50 000 to general and depreciation reserve, £10 000 to staff benefit fund, £10 000 to exchange reserve, dividends on preference shares for the year and interim dividend on ordinary shares, there was a credit balance of £54 922. The directors recommended a final dividend on the ordinary shares of 4% net, which would make a total of 7% net for the year, and leave £16 880 to carry forward. A great improvement had taken place in the general conditions in Portugal. He felt that they could look forward to the future with confidence and that the business would further expand with the general growth of the city. The report and accounts were adopted.

ANGLO-ARGENTINE TRAMWAYS CO., LTD.—At the meeting on June 25th, Sir George A. Touche, chairman, said during the 12 months under review the traffic surpassed all records, the passengers numbering 570 079 027, an increase of 9 331 473. The balance carried forward to net revenue account was £1 026 132, plus £26 044 from interest and minor receipts in London. The number of passengers carried by omnibuses in the city of Buenos Aires during 1928 was estimated at 190 000 000, and the number carried by all the tramways was 675 000 000. The significance of this comparison lay in its contradiction of the common belief that omnibuses everywhere could equal if not surpass tramcars in fulfilling the modern transit needs of large populations. The roads in the outer limits were not yet suited for omnibus traffic. The strain on the vehicles was excessive, the cost of operating heavy, and the life short. Under such conditions there was every temptation to concentrate in the central streets. In that way the omnibuses tended to increase rather than to relieve the existing congestion. In September last other competition made its appearance in the form of taxicabs plying for collective hire.

Digitized by Google

Their entrance into the arena of the traffic struggle had aggravated the difficulties of an already very serious situation. Progress through the principal thoroughfares had been rendered so slow as to be a matter of general concern. The company had continued to pursue its policy of bettering services, on both the surface and underground lines. But there could be no real cure while the chief causes of traffic congestion remain. The best solution lay in a combination of tramway, omnibus and subway. Some 6 000 000 more passengers were carried in the subway than in 1927. The final plans for the second subway, which would run between the big railway termini at Retiro and Constitución, were presented during the year for the approval of the authorities. The board were now awaiting such action on the part of the municipality as would render procedure with the work of construction economically possible. The report and accounts were adopted.

GLOBE TELEGRAPH AND TRUST CO., LTD.—The Earl of Midleton, presiding at the meeting on June 25th, said their gross receipts for the 12 months ended May 31st, 1929, were £359 191, an increase of £4 331. The net income after deducting working expenses was £347 389, making, with the balance brought forward, £399 711, an increase of £5 048. The directors recommended final dividends of 3s. per share, less tax, on the preference shares, making 6% less tax for the year, and 5s. per share, net, on the ordinary shares, making a total of 10% for the year, and carried forward £77 370. There had been two important mergers during the year. The Mackay Companies had now become the Postal Telegraph and Cable Corporation and the International Telephone and Telegraph Corporation, and their holding of 1 050 preferred shares and 6 070 common shares was now converted into £16 800 5% gold bonds, £12 690 debenture stock, and 4 553 $100 shares of the preference stock of the Postal Telegraph and Cable Corporation, and $1 518 100 shares of the International Telephone and Telegraph Corporation. The latter had since been converted into shares of no par value at the rate of three shares for each $100 share, and they had received an allotment of 455 shares at $50 per share, which they had taken up. The present market price of these shares was about $83. With regard to the merger between the Eastern Associated Telegraph Companies and Marconi's Wireless Telegraph Co., at its inception the object of the founders of their company was to stabilise the securities of the Cable Companies at a time when the scientific development of a new industry was not regarded with the same economic confidence as it would be at the present day. For years their shareholders were content, or had to be content, with a very modest return on their original £3 000 000 of issued capital, which had been gradually increased to £4 165 000. Between 1910 and 1920 they gradually crept up to 8%, and since 1920 to date 10% had been paid. On May 31st, 1928, the value of their securities was £7 123 350, against a cost price of £3 968 990, showing an appreciation of £3 154 359. In 1929, at date of issue of their balance sheet, the value was £9 013 700, against a cost price of £3 977 509, showing an appreciation of £5 036 191. They had complete confidence in the future of the merger company, but the new Cables and Wireless company's dividend on the 7½% stock could not be declared until July, 1930, when the working of this year had been ascertained. Consequently, in the coming year they could not be sure of receiving the full revenue on their holding from dividends on the 7½% merger stock. They had, however, by the conservative policy of recent years, a reserve available for dividends of £158 000 apart from their balance forward of £77 000, so that they might hope to continue without any difficulty their dividend of 10%, free of tax, which had now been paid for 10 years in succession. The report and accounts were adopted.

New Companies.

GENERAL INSTALLATION CO., LTD.—Cap., £100. Electrical and general engineers, etc. Reg. Office: 183, Edgware Road, London, W.3.

J. H. EVANS AND CO., LTD.—Cap., £2 000. General, heating and electrical engineers, etc. Reg. Office: 18, Smithfield Street, Liverpool.

SWIFT TRANSPORTS, LTD.—Cap., £10 000. Proprietors of light railways and tramways, trolley vehicle systems, etc. Reg. Office: Staines Road, Hounslow.

ASSOCIATED ELECTRICAL SUPPLIES, LTD.—Cap., £5 000. Manufacturers of and dealers in electrical supplies, apparatus, plant, etc. Reg. Office: Lagan Mills, Dromore, Co. Down.

DISTRICT SUPPLIES, LTD.—Cap., £10 000. To acquire business of dealer in electric fittings, wireless instruments, etc., carried on by B. Usick at 43, High Road, Wood Green, London, N.

BLOOMFIELD STEEL CONSTRUCTION CO., LTD.—Cap., £2 000. Constructional engineers, electrical engineers, etc. Solicitors: Stockdale and Brown, Victoria Chambers, Wednesbury.

GOULD AND LAKE, LTD.—Cap., £1 000. To acquire business of dealers in wireless and electrical apparatus now carried on by C. H. Gould and H. G. Lake at Tram Terminus, Poole, Dorset, as "Radio House."

J. LYONS (ELECTRICAL AND WIRELESS), LTD.—Cap., £200. To acquire business of electrical engineer and wireless dealer carried on by H. Lyons, trading as "J. Lyons," at 300/10, Willesden Lane, Willesden Green, London, N.W.2.

WOODHALL AND PARTNERS (1929), LTD.—Cap., £1 000. Manufacturers of, agents for and dealers in electrical equipment, contractors for the installation of electrical appliances, etc. A director: E. S. Hare, 47, Port Tennant Road, Swansea.

VANDERVELL ELECTRIC REPRODUCING CO., LTD.—Cap., £100. Manufacturers and repairers of and dealers in wireless, telegraphic and telephonic apparatus, etc. Solicitors: J. D. Langton and Passmore, 111, Old Broad Street, London, E.C.

ADVERTISING APPLIANCES, LTD.—Cap., £200. To acquire rights in respect of patents or inventions relating to illuminated signs (moving or stationary), for advertising purposes, or for dissemination of news or propaganda work, etc. Reg. Office: 57, Gracechurch Street, London, E.C.3.

WEINBAU INCANDESCENT AND ELECTRICAL CO., LTD.—Cap., £10 000. To acquire the business of manufacturers, importers and exporters of and dealers in electric lamps and bells, electric meters, switchgear, electric fittings, etc., formerly carried on by M. Weinbaum at 419-423, Commercial Road, London, E.1. Reg. Office: 419, Commercial Road, London, E.1.

Sulphur—Flowers, Ton £12 0 0 *Copper Sulphate*—Ton £25 to £25 10 0
„ Roll, „ £10 10 0 *Boric Acid* (Crystals) „ £30 0 0
Sulphuric Acid (Pyrites, 168°) Ton £6 15 0 *Sodium Chlorate*—Per lb. 2½d.
Sodium Bichromate—Per lb. 3½d.
Rubber—Para fine, 11d.; plantation, 1st latex, 10⅝d.

***. The metal prices are supplied by British Insulated Cables Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

The market opened last week with a slightly firmer tone, but, according to James Forster and Co., prices later became easier though the tone remained steady.

Closing prices on June 28th were £23 7s. 6d. for June, £23 6s. 3d. for July, and £23 5s. for August and September, 8s. 9d. to 7s. 6d. per ton easier on the week.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

311 020 F. H. Royce. Electrical turning-gear for starting internal-combustion engines. (14/2/28.)
291 425 R. Bomig. Device for fastening electric bonding-conductors to rail base. (3/6/27.)
287 167 C. Lorenz A.-G. Alternating-current electrical generators. (18/3/27.)
286 317 Quarzlampen-Ges. Mercury-vapour lamps or quartz lamps. (4/3/27.)
311 045 J. Morris. Electric storage batteries. (16/3/28.)
311 055 P. Freedman and W. J. Rickets. Piezo-electric substances. (29/3/28.)
288 288 Siemens and Halske A.-G. Device for measuring electric resistances with the aid of a cross-tail instrument. (9/4/27.)
288 979 L. Mellersh-Jackson (Maschinenfabrik Esslingen). Electromagnetic transmission gearing. (14/4/28.)
311 071 Graham Amplion, Ltd., and P. K. Turner. Sound-reproducing devices (16/4/28.)
311 075 A. Carpmael (Telefunken Ges. fur Drahtlose Telegraphie). Picture telegraph, television, and the like systems. (21/4/28.)
294 976 Siemens and Halske A.-G. Arrangement for the testing of electric resistances by means of a cross-coil instrument. (3/8/27.)
311 082 General Electric Co., Ltd., W. Wilson, and T. W. Dann. Electric transformers. (1/5/28.)
290 973 Telefunken Ges. fur Drahtlose Telegraphie. Picture and the like telegraph systems. (21/5/27.)
311 091 G. Brewer (F. Krupp A.-G.). Electromagnetic controlling-apparatus for transmitting movement electrically. (4/5/28.)
311 096 General Electric Co., Ltd., and L. Gardner. Electric radiators. (7/5/28.)
293 446 Marconi's Wireless Telegraph Co., Ltd. Electrical filter and the like frequency selective circuits. (7/7/27.)
291 057 British Thomson-Houston Co., Ltd. Regenerative braking of electric motors. (25/5/27.)
311 131 H. W. Sullivan, Ltd., and W. H. F. Griffiths. Electrical condensers of the variable differential type. (22/6/28.)
294 172 H. Stammereich. Metal-arc or metal-vapour lamps. (19/7/27.)
294 249 British Thomson-Houston Co., Ltd. Liquid-film seals for use in gas-cooled dynamo-electric machines. (22/7/27.)
302 884 Geb. Junghans A.-G. Means for the generation of compressed air for electropneumatic devices, in particular clock installations. (22/12/27.)
298 073 A. Rupps. Electric cigar-lighters. (1/10/27.)
308 675 P. Schober and R. Schober (trading as R. Schober). Electro-magnetically-operated vehicle direction-indicators. (26/3/28.)
300 263 Siemens-Schuckertwerke A.-G. Frame-shorting protective device for generator plants having several bus-bar systems. (10/11/27.)
301 327 Marconi's Wireless Telegraph Co., Ltd. Picture and the like telegraph apparatus. (25/11/27.)
301 510 C. Lorenz A.-G. Piezo-electric control of valve oscillation generators. (2/12/27.)
301 518 C. Lorenz A.-G. Vacuum-tube oscillators controlled with piezo-electric resonators. (2/12/27.)
303 171 Telefunken Ges. fur Drahtlose Telegraphie. Circuit arrangements suitable for use in valve transmitters. (29/12/27.)
311 004 G. W. Pierce. Magnetostrictive and piezo-electric vibratory systems. (3/1/28.)
281 728 Radiofrequenz Ges. and H. Eberhard. Piezo-electric quartz resonator or oscillator. (24/12/26.)
311 065 E. Pye and J. Heale. Tubular electric lamps. (15/10/28.)

Applications for Patents.

April 16th.

11 797 Automatic Telephone Manufacturing Co., Ltd., and L. M. Simpson. Electrical relays.
11 767 E. Baron and W. Burwell. Apparatus for electrical transmission of orders, etc., to ship's telegraphs.
11 753 Bing Werk, vorm Bing Akt.-Ges. Electro-magnetic switch arrangements. (19/4/28, Germany.)
11 808 L. Wolf-Carnejero and M. Peiser. Obtaining electrical power.
11 784 E. W. Challans, R. M. MacGregor, L. H. Peter, and Westinghouse Brake and Saxby Signal Co., Ltd. Electric relays.
11 756 J. E. Collyer and Coventry Automatic Telephones, Ltd. Automatic telephone systems, etc.
11 690 F. A. A. Elmore. Apparatus for testing electric coils.
11 763 International General Electric Co., Inc. Oil switches, etc. (17/4/28, Germany.)
11 764 International General Electric Co., Inc. Temperature compensation devices for electric measuring instruments. (19/4/28, Germany.)
11 781 G. K. Jensen. Electric resistances.
11 782 F. Murphy and E. J. Power. High frequency amplification by thermionic valves.
11 794 N. V. Philips' Gloeilampenfabrieken. Magnet systems for telephones, etc.
11 795 N. V. Philips' Gloeilampenfabrieken. Loud speakers. (27/4/28, Holland.)
11 777 A. H. Seabrook. Armouring for electric cables.
11 838 Soc. des Etablissements Industriels de E.C. and A. Grammont. Connections for rectifiers. (17/4/28, France.)
11 816 G. Somajni. Electric control apparatus. (20/4/28, Italy.)
11 740 H. N. Soper. Electrically controlled shutters.
11 787 Telefonaktiebolaget L. M. Ericsson. Telephone systems. (21/4/28, Sweden.)
11 817 Telefunken Ges. fur Drahtlose Telegraphie. Directional aerial systems. (17/4/28, Germany.)
11 785 Westinghouse Brake and Saxby Signal Co., Ltd. Electric rectifiers. (17/4/28, U.S.)

April 17th.

11 955 British Thomson-Houston Co., Ltd. Electric transformers. (18/4/28, U.S.)
11 956 British Thomson-Houston Co., Ltd. Electromagnetic apparatus. (18/4/28, U.S.)
11 964 Burovax, Ltd., and S. C. Winfield Smith. Telephone systems, etc.
11 988 F. B. Dehn (Mills Novelty Co.). Switch mechanism for electrically-operated musical instruments.
11 977 A. G. Clark, W. O. Heyne, and Plessey Co., Ltd. Wireless receiving sets.
1 1965, 11 966, 11 967 Electro Bleach and By-Products, Ltd., and J. Hollins. Electro-deposition of metals. (25/2/28.)
11 862 T. W. Fairlie. Electric light fittings, etc.
11 850 R. E. Forster, Tramcar, etc., seats.
11 971 W. T. Henley's Telegraph Works Co., Ltd. Contact arrangements of links, etc., for insertion in electric circuits.
11 954 International General Electric Co., Inc. Transformers. (17/4/28, Germany.)
11 966, 11 967 D. Jepson. Electrodeposition of metals. (25/2/28.)
11 847 B. K. Kirkby. Electrical keyboard for receiving messages.
11 929 R. Mayrshofer. Electric plugs. (21/4/28, Germany.)
11 981 W. D. Rhys. Means for controlling battery ignition circuits for motor vehicles, etc.
11 934 Siemens-Schuckertwerke, A.-G., and F. Wellhofer. Current transformers.
11 950 Siemens-Schuckertwerke, A.-G. Submarine cables.
11 935 Siemens and Halske, A.-G. Arrangements for transformation of light variations into changes of electric current, etc. (2/5/28, Germany.)
11 899 W. E. Styles. Electric switches.
11 894 U. C. Tainton. Methods of electrolysis.

April 18th.

12 115 Associated Electrical Industries, Ltd.—Control systems for power plants. (19/4/28, U.S.)
12 035 J. L. Baird and Television, Ltd. Apparatus for production of electric signals, etc. (20/6/28.)
12 036, 12 037, 12 038 J. L. Baird and Television, Ltd. Television, etc., apparatus. (20/6/28.)
12 063 E. J. Bertles and English Electric Co., Ltd. Electric contactor apparatus for rheostatic purposes, etc.
12 088 British Thomson-Houston Co., Ltd. Frequency changers. (13/4/28, U.S.)
12 030 Electro Bleach and By-products, Ltd., and J. Hollins. Electro-deposition of metals. (25/2/28.)
12 031 Electro Bleach and By-Products, J. Hollins, and D. Jepson. Electro-deposition of metals. (25/2/28.)
12 095 F. W. Fawdry. Overhead conductors for electric tramways, etc.
12 122 Ferranti, Ltd., and G. I. Finch. Electric spark discharge systems.
12 026 W. G. Gale. Telephone receivers, etc.
12 104 W. Haddon. Accumulators.
12 008 L. Hewitt. Electric terminals.
12 033 S. A. Hunter. Resistance grids.
12 013 P. L. V. Lambert. Electrical device for developing agriculture.
12 071 A. E. O'Dell (Elektrotechnische Fabrik Schmidt and Co. Ges.). Electric hand lamps, etc.
12 069 Telefunken Ges. fur Drahtlose Telegraphie. High-frequency generators. (21/4/28, Germany.)
12 075 Western Electric Co., Ltd. (Bell Telephone Laboratories, Inc.). Electrical transmission systems.
12 074 Western Electric Co., Ltd. (Electrical Research Products, Inc.). Sound recording, etc., systems.
12 028 Westinghouse Lamp Co. Cathode ray tubes. (23/4/28, U.S.)

April 19th.

12 217 Associated Telephone and Telegraph Co. Telegraph switching systems. (30/4/28, U.S.)
12 216 Automatic Telephone Manufacturing Co., Ltd., F. Kessler, and J. Scowcroft. Telephone systems.
12 200 R. W. Biles and A. Reyrolle and Co., Ltd. Electric protective arrangements.
12 203 British Thomson-Houston Co., Ltd. Protecting systems for a.c. commutator motors. (20/4/28, U.S.).
12 161 G. B. Burnside. Electric water heating apparatus.
12 173 Callender's Cable and Construction Co., Ltd. Production of foundations for poles, etc.
12 205 Dubilier Condenser Co. (1925), Ltd. Thermionic valves. (20/4/28, Germany.)
12 240 Electro-Physikalische Ges. and E. Kassner. Electrical condensers.
12 149 S. Frais. Storage batteries.
12 204 International General Electric Co., Inc. Dynamo-electric machines. (23/4/28, Germany.)
12 246 H. T. Logan. Terminal mounts for radio sets.
12 197 Newton and Wright, Ltd., and H. A. Quinton. Electrical controlling apparatus for hot cathode X-ray tubes.
12 232 A. Peloux. Automatic cut-outs.
12 238 Pirelli-General Cable Works, Ltd. Apparatus for de-gasifying liquids.
12 179 J. R. Quain. Electric signs.
12 224 F. Savayo. Operating plurality of adjustable members of wireless receivers. (20/4/28, France.)
12 222 Siemens and Halske A.-G. Train controlling systems. (20/6/28, Germany.)
12 176 Standard Telephones and Cables, Ltd. Electronic device. (26/4/28, U.S.)
12 266 C. W. I. Thomas. Bell indicator and fire alarms.
12 198 R. A. L. Volet. Electrical machines comprising rotary working tools. (10/5/28, Belgium.)

April 20th.

12 366 British Thomson-Houston Co., Ltd. Electric meter compensating devices. (24/4/28, U.S.)
12 357 H. V. Carlisle and Ferranti, Ltd. Radio receiving systems.
12 345 Duro-Ray, Ltd., and R. W. Johnston. Electric lamps.
12 326 M. B. Field. Magnetic compasses.
12 363 V. H. Gilbert and Radiovisor Parent, Ltd. Manufacture of light sensitive bridges.
12 293 T. Hartley. Electric wiring, etc., clip.
12 335 A. P. Lundberg and Sons, Ltd., and G. Pegg. Electric lampholders.
12 304 L. H. Pearson and W. J. Randall. Means for controlling and operating electrical circuits.

COMING EVENTS.

Friday, July 5th (To-day).

Tramways and Light Railways Association.—Sheffield. Annual Congress.
Overhead Lines Association.—Summer meeting. Charabanc tour in the Mid-Cheshire area, starting from Winsford (L.M. & S.), 12.15 *p.m.*

Saturday, July 6th.

Physical Society.—Visit to Birmingham and meeting at the University. Leave Paddington, London, 9.10 *a.m.*

Monday, July 8th.

Electrical Contractors' Association (Liverpool Branch).—Ordinary meeting.
Electrical Contractors' Association (Hastings Sub-Branch).—Lewcocks' Restaurant. Ordinary meeting.

Tuesday, July 9th.

Electrical Contractors' Association (Leicester Branch).—Corridor Chambers. 2.30 *p.m.*
Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.

Wednesday, July 10th.

Electrical Contractors' Association (Eastbourne Sub-Branch).—South Street. Ordinary meeting.
Electrical Contractors' Association (Sheffield Branch).—Ordinary meeting.

Wednesday, July 10th—Friday, July 12th.

Electrical Association for Women.—Conference and Annual General Meeting at Newcastle-on-Tyne, by invitation of the North-East Coast Branch.

Thursday, July 11th.

Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.
Electrical Contractors' Association (East Yorks Branch).—Metropole Hall, Hull. Ordinary meeting.
Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.

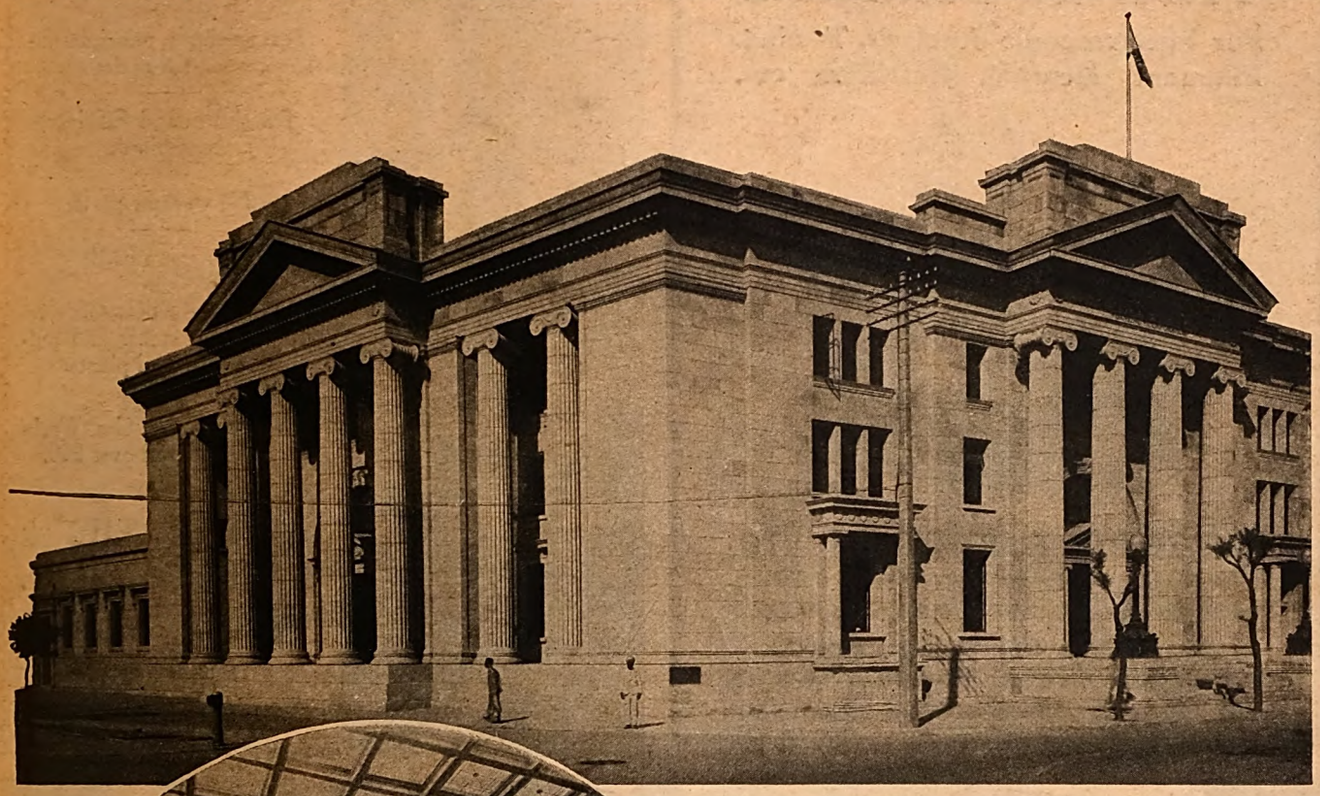
THE ELECTRICIAN

Vol. CIII.—No. 2667. Friday, July 12, 1929. [Registered at the General Post Office.] Sixpence



Another Chinese Bank

Henley V.I.R. Wires of 600-Megohm grade installed in steel conduit form the basis of the electrical installation of the Hong-Kong and Shanghai Banking Corporation's imposing building in Tientsin.

An interesting feature of this installation are the combined lamp standards and electric fans, shown in the smaller illustration.

At home and Overseas the best Contractors use the best possible wires for the best of installations.

There is a flexible cord which does not kink or break at the connector. It is Henley "Thermoid" Flexible Cord.

The Need for International Specifications.

A SERIES of meetings of the members of the International Electrotechnical Commission on questions relating to machinery and materials used in connection with electrical work was concluded in London last week. A large number of foreign delegates took part in the discussions, which were organised by the British Committee of the I.E.C., in conjunction with the Steam Turbine Section of the British Electrical Manufacturers' Association, which association, so far as work in regard to the formulation and amendment of standard specifications is concerned, is included in the Electrical Section of the British Engineering Standards Association. The time may, perhaps, be opportune to indicate briefly the relationship of the B.E.S.A. and the I.E.C. The Electrical Section of the B.E.S.A. is identical with the British Committee of the I.E.C., and this section or committee has long been of opinion that, in addition to purely electrical work, it is the proper body to deal also with the mechanical portion of plant used for electrical purposes. In pursuance of this policy, it raised, amongst other matters for discussion at the recent sessions, important proposals with a view to securing an international specification for cast iron and a recognised international standard providing a common basis on which tenders for machinery should be prepared. British manufacturers often fail to secure important contracts because foreign firms can undersell them, in consequence of the use of inferior materials, the defects of which are not discovered until after the makers' guarantee period has expired. To revert to the matter of the organisation of the I.E.C., the national committees in the various countries are in touch with the central office in London, and some of the said national committees are each made the secretariat of an international committee dealing with a certain subject. For instance, the British National Committee is the secretariat of an international committee dealing with the rating of electrical machinery, and the French National Committee is the secretariat of an international committee dealing with traction motors. Technical details of the results of the recent discussions will be published by the I.E.C. in due course, while a brief report of the social activities following the conclusion of last week's meetings will be found elsewhere in this issue.

The I.E.E. Conversazione.

THE annual conversazione of the Institution of Electrical Engineers, which was held on Thursday of last week, was, as usual, a most imposing function, and the vast assembly received by the president, Lieut.-Colonel KENELM EDGCUMBE, and Mrs. EDGCUMBE, included many notable scientists and engineers. The string band of the Royal Engineers gave able renderings of a variety of musical selections, and a company of talented artistes provided an enjoyable instrumental and vocal concert. The fact that the function is held in the Natural History Museum at South Kensington—which, like other buildings of a similar character, engenders a feeling akin to awe in most people, even when they are far past childhood—does not appear to reduce the attendance. We do venture to think, however, that if a sufficiently large hall minus collections of exhibits in glass cases could be secured for the conversazione, and if those who listened to the concert were not obliged to sit at—and almost on—the feet of skeletons of dinosaurs and other monsters in the Reptile Gallery, there would be no risk of its encouraging too great a departure from the solemnity which seems to be considered proper to the Institution's entertainments. Another advantage ensuing from a change of venue might also be liberty to smoke in some part of the premises, which would certainly be appreciated by a considerable number of the visitors.

Power Transmission in the United States.

THOUGH we in this country have perhaps always associated the transmission of power in the United States with long distance, such conclusions are apparently without foundation, for, according to the N.E.L.A., a review of the movement of electric power during the past few years indicates that the average distance traversed by the average kWh in its course from power house to consumer in the United States is about 22 miles. If the production of the State of California, with its power plants for the most part in the Sierras and its use in the lowlands along the sea coast, is excluded, the average for the rest of the States

Digitized by Google

is only 18 miles. It would seem therefore, that in spite of the progress in the interconnection of electric light and power systems and the extension of transmission lines during recent years, the bulk of the energy is still consumed in the vicinity of the power plants. To some extent this is the result of economic factors which have dictated the position of steam plants in the near neighbourhood of the large markets for their power in the seaboard cities and the industrial regions of the country. It is also the result of the increasing economies being effected in generation by steam near the centres of use, as compared with the cost of making water-power developments at a distance and of bringing this power to market over long transmission lines. Statistics indicate that this average distance travelled by electric power is becoming shorter and that this trend should gradually become more pronounced. Although the production of hydro-electric power in the United States was larger than the average during 1928, this represents a situation which probably will not persist, for many of the projects recently completed were determined upon and prepared at least five years ago, when the price of coal was at its peak and when the efficiency of steam generation was much lower than it is at present. Since then, the operating cost of generating by steam has, in America, been cut nearly in two, and, as a result, the attractiveness of most of the remaining undeveloped water-power plants has been seriously impaired. Five years from now, the oft-repeated prediction as to the shrinkage in the proportion of the total amount of electric energy produced in the United States by water power will, in all probability, be measurably fulfilled.

A Fallacy Re-exposed.

THE old mistaken theory that from the business point of view the holiday months must of necessity contribute a period of slackness has been the subject of frequent references in our columns in recent years, but careful observation this year has fortunately shown that the warning against holiday-time slackness is not nearly so applicable to the electrical industry now as it was three or even two years ago. The ideal of " business as usual " during the months of July, August and September is one that is well worth striving for. It has been shown over and over again that instead of having less to spend during this period most people are spending money more freely and at a greater rate than at any other time of the year. This tendency can obviously be turned to account on the domestic appliance side. In the heavier fields of manufacturing this expenditure of the savings of nine months is not a feature of the season, but the same old holiday spirit frequently holds up important constructional and development work, and in this and other ways profoundly affects the year's trading results. The remedy for this is easy, but it can only be applied when executives realise that deputies may—at least for a short time during their absence—quite capably carry out much of the normal work of their chiefs, and that by thus delegating responsibility they not only permit work to proceed unhampered but give those temporarily in charge a keener interest in, the job and an added sense of responsibility which cannot fail to be of value to their employers. We are glad to see that one of the popular daily papers is devoting a considerable amount of space to a re-exposure of the fallacy that holiday time is a slack time for business, and it is also interesting to note that some of the biggest national advertisers are giving practical evidence of their belief in the theory that the holiday months are particularly good ones for the advertiser.

Registration Progress.

THE latest figures of admissions to the National Register of Electrical Installation Contractors are distinctly gratifying. At its last meeting the Executive Committee had for consideration no fewer than 48 applications for registration, and of this number 37 were accepted. The current list of newly registered contractors is also of interest in view of the fact that 17 out of the 37 successful applicants are carrying on business in Leeds, where enrolment on the National Register is a necessary qualification for any installation contractor desirous of participating in work on the Corporation's wiring schemes. The supply authority's action at Leeds has been, and is being, imitated in other places, and it is becoming increasingly evident that suppliers who in the past have been critical of installations connected to their mains now have the remedy entirely in their own hands. By insisting that installations over which they have control are put in by registered contractors they not only help to raise the status of the installation side but also equip themselves—through the Registration Board—with disciplinary powers against any contractors who may transgress the accepted canons of sound installation work.

Domestic Appliances in Canada.

THE increasing use of electricity for domestic purposes in Canada is, as must be expected, having a direct effect on local manufactures of electrical appliances. From the standpoint of the number of individual units, the largest production in the entire industry is in dry cell batteries, followed by incandescent lamps, accumulators and irons. The growing popularity of radio has accounted for a greatly increased production, but the item which has made probably the greatest advance is electrical refrigeration. Whether one looks to electric cookers, stoves or vacuum cleaners, everywhere is there a considerable increase in manufacturing output to be found, showing that though Canada is still in advance of the mother country so far as the domestic application of electricity is concerned, there is still room for further development. As an Empire market Canada should offer opportunities to manufacturers in this country, and though much of the imported electrical apparatus is made in America, many of the Canadian people would prefer if possible to buy British. In many ways, Canada has become the Cinderella of the Empire so far as electrical manufacturers in the country are concerned, and though they look to Australia, New Zealand, India, and South Africa for orders, rarely do they remember the electrical importance of the Dominion of Canada.

Electrical Development in Belgium.

PERHAPS one of the most interesting developments of the electrical industry since the war is that taking place in Belgium. The majority of the distribution system is carried out with overhead lines, and it is interesting to note that the total length of lines, both of high and low tension, now attains 25 000 kilometres. This figure compares with 8 800 kilometres in 1900 and 14 000 in 1924, and of the total population of 7 930 000 as many as 7 270 000 are served with electrical energy. Public authorities are taking a lively interest in the use of electricity, either by means of subsidies for the construction of lines as in the case of Eastern Flanders and the provinces of Luxemburg and Namur or by participating in the formation of associations for the purpose of exploiting a system, as has happened in the Provinces of Antwerp, Limburg, Liège, Hainaut and Western Flanders. In the province of Brabant an association has just been formed which will serve nearly all the community within its boundaries hitherto unprovided with electricity. Centralisation in the industry is, as here, again noticeable, and the Union of Liège power stations have been joined by the power stations of Namur and Luxemburg with the title of " Linalux." Distributing companies have founded the Union Belge des Producteurs d'Electricité, whose aim is to group all producers without infringing the unacquired rights, while further mergers will probably take place with a view to a community of interest and consequent further development of the industry.

RECENT ELECTRICAL PROGRESS IN INDIA.*

Testing Out Automatic Telephone Exchanges—Electricity Supply Available in all Cities—Increased Demand in Calcutta—A Sub-station Equipped for "Siege Conditions"—The Position in Industrial Areas.

By A. T. COOPER, M.Inst.C.E., M.I.Mech.E., M.I.E.E., M.Cons.E.

DURING the past five years the total annual value of Indian imports of electrical apparatus, machinery and accessories has averaged 5½ crores of rupees (about £4 000 000), and has not varied more than 10% on either side of that average. Although this figure includes the cost of replacements of existing articles which have worn out or become obsolete, it does not include that of the many items of plant and material ancillary to electrical development. Assuming that the addition on the one hand cancels the omission on the other, and bearing in mind the growing tendency to manufacture many small electrical articles in the country, the steadiness of the absorption may be deemed to be indicative of substantial progress.

TELEGRAPHY.—The principal improvements in land line working, which have been introduced by the Government of India Telegraph Department during the last six or seven years, have been in connection with long distance circuits employing high-speed printing systems. The installation of regenerative repeaters or retransmitters has rendered quadruple "up-and-down" working on the Baudôt system possible over the longest circuits operated by the department. Calcutta—Agra, 808 miles, and Bombay—Agra, 843 miles, are worked satisfactorily without any intermediate retransmitting station.

Progress in Wireless Communication.

The most recent application of wireless telegraphy is of outstanding importance. In 1925 the Indian Radio Telegraph Co. was floated for the purpose of establishing a system of reciprocal wireless communication between India and Great Britain, and a short-wave transmitting beam station at Kirkee, near Poona, and a receiving station at Dhond, were officially opened by the Viceroy in July, 1927, and came into regular public use two months later. The success of the "Empiradio" wireless service was immediate, and the volume of traffic so far exceeded the estimates as to constitute an actual embarrassment. An extension of the beam system from India to other countries is under negotiation, and developments in this direction are anticipated as soon as the merger between the submarine cable and wireless interests has come into active operation.

Further uses for wireless telegraphy will no doubt be found in India, such as navigational direction-finding (stations at Karachi, Bombay, and Calcutta having already been installed) and also for communication with lightships and police outposts.

TELEPHONY.—Developments under this head may be broadly divided into two classes: (1 Those relating to the modernising of old exchange equipment. (2) Those in connection with long-distance working with the aid of thermionic repeaters.

Within the last few years a number of automatic exchanges have been installed by the Government in place of the original manually-operated plants. Details are as follows:

Name of Exchange.	Size. Present Equipment (Circuits).	Size. Ultimate Capacity (Circuits).	Type of Automatic Equipment.
Delhi	1 500	3 000	Peel-Conner, Machine
,,	1 400	3 000	switching.
Cawnpore ..	500	2 000	Ditto.
Nagpur	200	500	All-Relay (Relay Automatic Co.).
Poona	500	1 000	Ditto.
Amritsar	700	700	Strowger, Machine switching.
Rawalpindi ..	500	600	All-Relay (Relay Automatic Co.).
Quetta	300	300	Ditto.
Allahabad ..	220	300	Ditto.
Bengal Coalfield Exchanges (4) .	780	2 000	All-Relay (Peel-Conner).
Ootacamund ..	150	300	Ditto (Relay Automatic Co.).
Conoor	150	300	Ditto.
Meerut	80	160	All-Relay (Peel-Conner).

* Extract from a paper read before the Indian Section of the Royal Society of Arts.

Upon the working of these exchanges the Government will shortly be in a position to decide which system of automatic working is best suited to Indian conditions.

The telephone service in the three Presidency cities, and also in Karachi and Ahmedabad, are in the hands of private companies working under licence.

Bombay (9 000 subscribers) and Madras (3 000 subscribers) have both recently changed over to automatic working, but Calcutta (9 000 subscribers) still retains manual operation.

Extensive development in the Government long distance trunk service has recently taken place, and the network is now very comprehensive.

For distances of over 350 miles thermionic repeaters are used, and the quality of speech transmission is claimed to be good, as a rule, up to 1 000 miles, but beyond this distance difficulties in maintaining uninterrupted communication are met with. In the absence of "interruption" or "disturbance," "commercial" speech is sometimes possible between Calcutta and Bombay via Delhi, a distance of 1 800 miles, but as compared with Europe and the U.S.A., India is evidently very backward in long-distance telephony in spite of the urgent need for an efficient service for linking up the ports with the capital and with industrial centres.

So far, no provision for inter-continental telephony has been made, but it forms part of the future programme of the Indian Radio Telegraph Co.

ELECTRICITY SUPPLY.—A general supply of electrical energy is now available in all Indian cities of any importance, while many licences for supply in the smaller urban centres have recently been granted. In the secondary towns, with few exceptions, oil engines have been utilised as prime movers, while in the larger, apart from Bombay, steam turbines and water tube boilers are employed.

The demand per head of population varies over wide limits, ranging from 5 or 6 units per annum in some of the smaller cities to about 200 in the case of Bombay.

The following notes record some recent developments in the principal cities, taking them in the order of relative population of areas of supply:

Calcutta.—The demand has recently increased very rapidly, and energetic steps have had to be taken by the Electric Supply Corporation to keep pace with the requirements of its population of one and a half millions.

In 1925 100 million units were sold. Last year this output reached 148 millions, while the estimate for the current year is 168 millions.

The first section of a new Southern power station laid out for an ultimate capacity of 150 000 kW came into operation at the end of 1926. This is equipped with stoker-fired water tube boilers and turbo-alternators generating at three-phase 6 000 V, circulating water being taken from the River Hooghly.

So far, 24 000 kW of plant have been installed and a further 15 000 kW set is due for installation this year.

Circulating Water at 93 deg. F.

Although this new station was designed more with an eye to high reliability and low maintenance than to spectacular steam results, only 200 lb. pressure and a total steam temperature of 600 deg. F. being utilised, yet its actual performance works out favourably when compared with the modern home stations of the same size and equipped for much higher steam pressures and temperatures, the overall thermal efficiency for last year being in the neighbourhood of 14%, and this in spite of the many tropical disadvantages met with, including circulating water running at times up to 93 deg. F.

The Southern station is linked up with the older Northern station at Cossipore by means of two 6 000 V trunk feeders laid along separate routes.

The leading developments to be noted with regard to the general supply in the city are the recent completion of the transfer of the Tramway Company's load to the Electric Supply Corporation and the substantial progress made in the electrification of the jute mills and other large industries.

An interesting recent addition to the distribution system is a large rotary sub-station arranged for an ultimate capacity

Digitized by Google

of nearly 40 000 kW of convertor plant. As this is situated in a somewhat critical position in the bazaar, it is fully equipped for "siege conditions" during periods of communal disturbances, special window and door protection being arranged, together with provision for rationing and for emergency sleeping quarters for the running staff.

Bombay.—The outstanding recent development in Bombay was the completion of the change-over from a thermal power station to bulk hydro-electric generation. For many years the Electric Supply and Tramways Co., although owning a large steam power station on the waterside, had taken supply from the Tata Hydro group on outlying districts to avoid the necessity of running out costly feeder mains, and when, owing to the rapid increase in the demand, they came to be faced with the necessity for major extensions to their power station, a contract was entered into with the Hydro Companies for their entire requirements. The change-over necessitated building a large receiving station alongside the steam power station. This is fed at 20 000 V 3-phase from the Tata receiving station, and is equipped with 20 000/5 500 V transformers and the necessary switchgear. The change-over of the 550 V feeders to the new receiving station was of necessity a gradual one, but the whole of the load was finally transferred in January, 1926, and the power station shut down.

Development in the D.C. Area.

A more recent development in Bombay city has been the decision to deal with the direct current area in the Fort district by means of remote-controlled peak-load rotary convertor sub-stations located at strategic points and operated from a central control office.

As regards the general tendency of public electricity supply in this city, it is interesting to record that the middle-class Indian has not been slow in taking advantage of the domestic amenities which electricity has to offer in the way of refrigerators, water heaters and electric cooking appliances, while the electric *dhobi* is rapidly gaining favour, and the charcoal *sigri* will shortly become a suffocating memory.

The recent decision of the G.I.P. Railway to instal electric cooking apparatus throughout the large restaurant in the new building at their Victoria Terminus constitutes a significant confirmation of the adaptability of this application of electricity to Indian conditions.

The B.B. & C.I., the other railway running into Bombay, have adopted flood-lighting of their administrative block for notifying the arrival of their mail trains at night.

Madras.—This third city of India is supplied with electrical energy on the same lines as those obtaining in Bombay and Calcutta, i.e., direct current in the centre and alternating current in the outskirts. The Madras climate, which has been described as "three months hot and nine months hotter," calls for the continuous use of electric fans which, while contributing to the satisfactory annual load factor of 45%, have been recently utilised as a means of improving the power factor of the alternating current system. Condensers have been incorporated with all fan regulators, bringing the system power factor up to 0·95, and sometimes near unity.

Delhi.—Although the capital city of British India and fourth in order of population, the electricity supply arrangements in Delhi call for little comment. An English company has for many years dealt with the public supply in the old city from an oil engine plant, while the requirements of the new Imperial City and the cantonments are derived from a small steam power station put down by the Government in 1925 equipped partly with old and partly with new generating plant, transmission being at 6 600 V 3-phase, with distribution on the direct-current system. As the aggregate generating capacity of the two undertakings is only 6 000 kW, it is to be regretted that no combination of interests was found possible.

Lahore.—This city is now supplied by the local company on modern lines from a new steam turbine station with 3-phase generation and 6 000 V underground transmission to rotary and static sub-stations. Over 9 000 consumers are connected, and the annual consumption is about 5 million units.

As Lahore is shortly destined to become the terminal station of the long distance transmission from the Mandi hydro-electric installation referred to later, its supply of electrical energy appears to be well assured.

Ahmedabad.—Considering its population of only 200 000, Ahmedabad may claim to be one of the most industrialised cities in India, but although it possesses nearly 100 textile mills, it is only recently that a general power supply has been seriously contemplated. The successful local Electric Supply Co. with its Diesel driven plant has not been in a position to cater for large blocks of industrial load, and some of the more enlightened mill-owners have installed their own generating stations in order to obtain the advantages of the electric drive.

Last year, however, the Ahmedabad Power Electric Licence was granted authorising the supply to industrial users, and it is hoped that if sufficient support is forthcoming a concrete scheme may shortly be prepared. In view of the condensed nature of the industrial area on the one hand, and the comparatively low average individual capacity of the mills, viz., 700 H.P., on the other, there is evidently an opening for a successful power undertaking.

Karachi.—Although at present it stands ninth in the list of Indian cities as regards population, Karachi has a great future before it, not only as a maritime but also as an air port, and the local Electric Supply Corporation has been fully alive to the necessity of providing for the future. In 1924 a 6 600 V 3-phase power station was built alongside the old d.c. plants in order to enable outlying areas to be dealt with, and several schemes are projected for throwing over the load of small private generating plants on to the public distribution system. Diesel-type prime movers are used throughout.

Cawnpore.—No outstanding recent technical developments can be recorded in connection with the electric supply system of Cawnpore (which apart from the Presidency cities may be looked upon as the pioneer system in British India, general supply having been started on Christmas Day, 1906), yet attention must be called to the rapidity with which demand has been fostered during the past few years by the far-sighted administration of the Cawnpore Electric Supply Corporation. Following the laying down of a new riverside power station in 1921, the consumption of electrical energy has increased nearly fivefold, from 5½ million units in 1922 to 27 millions in 1928, while the average receipts per unit sold have been lowered during that period from 2·62 annas to 1·26 anna.

Aden.—Although this paper is only intended to cover the Indian Peninsula, and no attempt is made to deal with Burma and the numerous outlying islands and dependencies which fall within the Indian Empire, it may, perhaps, be permitted (as the writer had a hand in the scheme) to make reference to the electric supply undertaking at Aden, which, although 1 600 miles from the Indian coast, is yet included from an administrative point of view, in the Bombay Presidency. This arid "Gibraltar of the East" had long craved for the amenities which electricity can provide, and under the ægis of the Settlement (or Municipality) a general supply was inaugurated in February, 1926. An installation comprising oil-fired water-tube boilers and small geared turbo-alternators arranged as a miniature replica of a large modern steam power station now supplies the settlement and cantonments through 6 600 V 3-phase overhead lines stepped down to 230 V by transformers located in the bases of special transmission towers. The undertaking secured immediate support, and the initial outlay having been cut down to a minimum, the results for 1928, the third year of working, show a substantial surplus after paying all interest and sinking fund charges on a total capital expenditure of 11¾ lakhs of rupees.

(*To be continued.*)

INDICATING INSTRUMENTS.

REVISIONS of B.S.S. Nos. 89 and 90, dealing with indicating instruments and graphic (recording or chart recording) instruments respectively, have recently been issued. The technical requirements of these new specifications are similar to those of the previous editions, with the important exception, however, of the clauses dealing with the marking of the instruments and the issue of test certificates. In the past difficulties have been experienced in connection with the provision of the independent test certificate required under the conditions governing the use of the Mark "BeSa," and, in order to facilitate matters, a report is now called for in place of the certificate originally required. The substitution of the report for the certificate arises from the fact that "certificates" issued by the N.P.L. have acquired a special significance of their own in the eyes of the public, as something in the nature of a guarantee that the article concerned is a satisfactory one, quite independently of the B.S.S. covering the article submitted for test. What is often required is a plain statement from the testing authorities that the article submitted conforms in certain respects to the appropriate British Standard. Such a statement is now provided as a report.

Copies of the new specifications may be obtained, price 2s. 2d. each, post free, from the British Engineering Standards Association, 28, Victoria Street, S.W.1.

A HIGH FREQUENCY OSCILLOGRAPH.

Simultaneous Recording with Three Vibrators—Investigations at Telephone Frequencies—The Apparatus Described—Simplicity of Operation.

THE rapid advances which have been made in the analysis of complicated phenomena in electrical circuits have stimulated the demand for an oscillograph which is capable of producing simultaneous records from three vibrators. Such an instrument should of necessity be easy to operate, compact and sufficiently robust to withstand ordinary workshop conditions.

Within the last year or so instruments of this type have been developed by the Cambridge Instrument Co. for low frequency work in circuits up to 600 V, and also for high tension circuits up to 100 000 V. This firm has now designed a somewhat similar outfit for use on high frequency circuits. This apparatus, which is illustrated in Figs. 1 to 3, has the frequency and sensitivity of the original Duddell design, but possesses several additional features which render it particularly suitable for investigations at telephone frequencies.

The three vibrators, A, B, C, are separate units mounted in individual oil baths. They may thus be independently operated, and should one of the vibrators become defective, it may be easily and quickly replaced. Provision is made for adjusting the position of each vibrator so that the image of the vibrating mirror is brought to the correct position on the sensitive photographic surface. Each vibrator is protected by a fuse and controlled by a switch which enables the polarity of the supply to the vibrator to be reversed. The undamped natural period of the vibrators is 0·00008 sec., and the d.c. sensitivity (in oil) is 60 mA for a deflection of 20 mm. at a scale distance of 60 cm.

The three vibrators in their oil baths are mounted between the poles of an electro-magnet, which is of somewhat simpler design than the electro-magnet used in earlier types of Duddell oscillographs. The provision of a small air gap between the magnet cores and the coil windings minimises the conduction of heat to the vibrator elements and thus reduces any changes in the viscosity of the oil in the oil bath, and hence in its damping effect. The magnetising coils may be connected in series for use on a 220 V d.c. circuit, or in parallel for a 110 V d.c. circuit. The oscillograph stands in a metal case on the front of which is a switchboard accommodating the necessary terminals, fuses, switches, etc. A metal cover prevents any extraneous light reaching the vibrators when a record is being taken. A lamp connected across the windings protects the electro-magnet against voltage surges on switching off.

The oscillograph in its case, the automatic arc lamp E and the camera F are mounted on a substantial base-board. The carbons of the arc lamp are fixed at right angles to each other and are controlled by an automatic feed. This type of lamp has been used satisfactorily for some years. Provided that the voltage of the supply is reasonably steady, no troubles occur due to flickering or hissing. The light from the lamp passes through an optical system which ensures that a separate beam of light is brought to a focus on each vibrating mirror, an adjustment enabling a more intense light to be obtained at higher frequencies, if desired. The reflecting beams from the vibrating mirrors pass through a cylindrical lens which reduces the long slit images to bright spots of light on the photographic surface, which travels in a vertical plane at right angles to the plane of the vibrating beams. When the camera shutter is closed, the beams of light, instead of passing into the camera, are reflected by means of a polished stainless steel mirror fitted at the back of the shutter, on to a semi-transparent celluloid screen. On viewing the movements

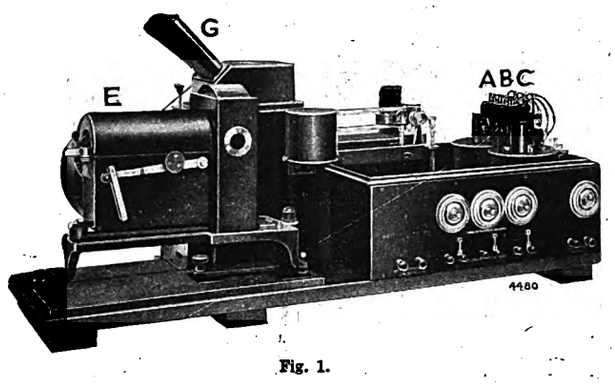

Fig. 1.

of the spots of light on the screen by means of a system of rotating mirrors, the operator sees the wave form of the circuit under investigation. The rotating mirrors are driven at the correct speed by means of a belt from the spindle which drives the camera; this, in turn, being driven by means of an electric motor. The wave forms are viewed through the aperture G.

Prior to taking a record the adjustment of the vibrators is facilitated by projecting the light images reflected by the vibrating mirrors on to a white screen, which may be brought in front of the cylindrical lens. Having roughly aligned the spots of light with the aid of this screen, it is hinged out of position. The shutter is then opened and the light images after passing through the cylindrical lens, pass through the aperture on to a frosted screen in the same plane as the photographic surface. The final adjustments may then be made. The standard outfit includes a drum camera taking film or paper 7 cm. wide by about 48 cm. long. The shutter is spring-operated, and it is released and controlled by means of two electro-magnets. These electro-magnets are operated through an adjustable contact device on the camera driving spindle, the contacts being so set as to utilise the whole length of film or paper in either one, two or four exposures, as desired. The shutter is reset (that is closed) by means of a plunger and the process of resetting extends the control spring to its maximum position. On energising the first electro-magnet, the shutter moves to the fully open position. At the completion of the desired exposure, the second electro-magnet is energised, which allows the shutter to complete its travel, and again close the aperture. It is only when the shutter is closed that the stainless steel mirror reflects the spots of light from the vibrating mirrors for visual observation. Since it is desirable to have the drum rotating at the required speed

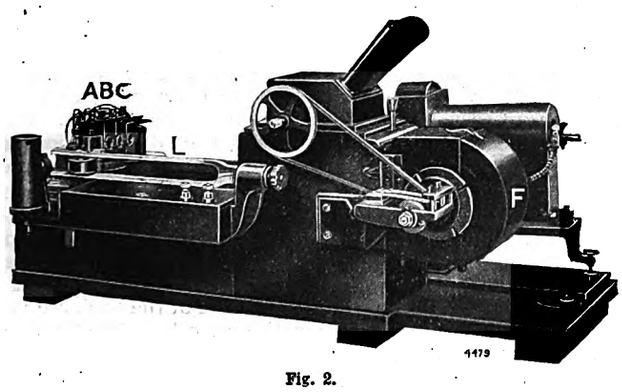

Fig. 2.

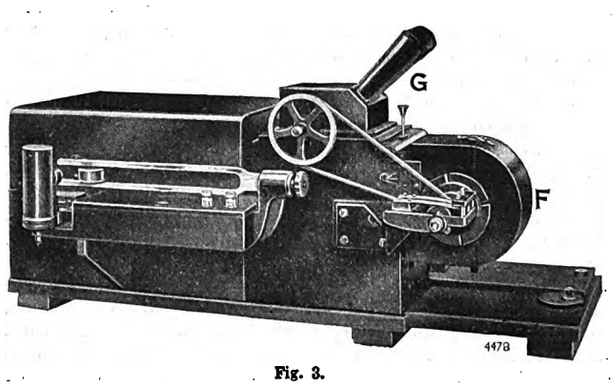

Fig. 3.

Digitized by Google

while the wave form is being observed visually, it is necessary to prevent the shutter operating at each revolution of the spindle until it is desired to take a photograph. A tapping key is therefore connected in series with the spindle contacts, and, when the operator desires to obtain a record he depresses this key, thereby closing the circuit to the contacts on the spindle and energising the electro-magnets in the correct sequence.

When the outfit is to be used for investigations lasting a considerable time, the drum camera may be replaced by a film camera using film having a width of 6·4 cm.; records up to 30 metres in length may be obtained. When using this camera, the camera shutter is closed until the operator moves a lever which tightens up the driving belt, through the medium of a jockey pulley, thus transmitting the drive to the camera and, at the same time, closes a contact which allows the shutter to open. The shutter remains open as long as the camera is running—that is, as long as the operator holds the lever over. When the record has been obtained the lever is allowed to return to its original position, when the driving belt is slackened and the circuit opened, thus stopping the movement of the film and closing the camera shutter.

A convenient accessory is a timing device consisting of an electrically maintained tuning fork L (see Fig. 2) to each prong of which is fitted a metal plate with a horizontal slit.

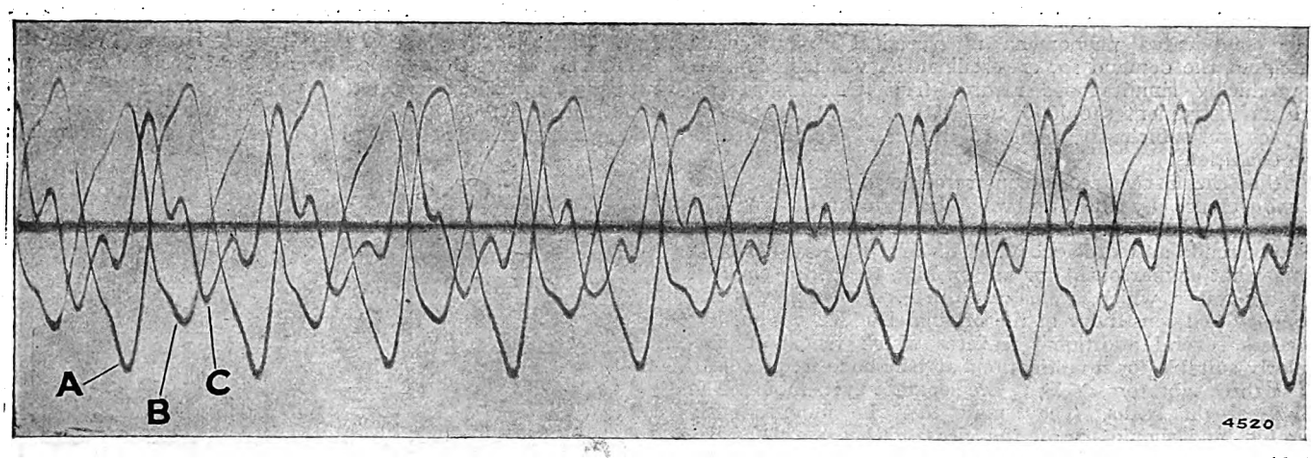

Fig. 4.

When the fork is in the position of rest these slits are coincident and allow a beam of light from a metal filament lamp to pass through the optical system on the fork and come to a focus on the photographic surface. When the fork is vibrating the slits come into coincidence at each passage of the fork prongs through the zero position, causing a horizontal shadow to be marked on the photographic surface. The fork has a frequency of 50 cycles per second, so that time markings are produced on the record at 0·01 second intervals.

Fig. 4 shows a full-size reproduction of a portion of a record obtained on bromide paper. Curves A and B represent two non-inductive loads while C is a capacity load consisting of a condenser (capacity 0·05 mfd.). The source has a frequency of 600 cycles per sec. The horizontal line in the record is obtained by means of a zero mirror.

BOOK REVIEW.

A Course in Electrical Engineering. Vol. II. Alternating Currents, 2nd edition. By CHESTER L. DAWES. (London: McGraw-Hill Publishing Co.) Pp. xvii+618. 20s. net.

Six years have elapsed since the publication of the first edition of Prof. Dawes' volume on alternating-current working. The book was designed to give a course for engineering students who were not specialising in electrical engineering, so that a wide range of subjects was included, while the treatment was essentially elementary and largely descriptive. It would seem, however, that the book has also found favour as a text-book for students taking electrical engineering courses in schools and universities. In view of the higher standard of attainment demanded for the latter, and the changes and progress which have been made in almost every branch of electrical engineering since the first appearance of the book, a new edition has been considered desirable.

The author assumes a knowledge of the principles of direct-current working on the part of the student, and begins with an account of the fundamental laws of alternating currents and alternating current circuits on familiar lines. The sequence followed, in a few cases, is not to be recommended. One example occurs in chapter two, where power is treated before inductance and capacity in the a.c. circuit. Again, it would be better to discuss the polyphase wattmeter after, and not before, polyphase working and three-phase power measurement. However small such points may appear, every teacher knows that a correct sequence is of the utmost importance, when a subject has to be developed from first principles. The chapters on elementary alternating-current theory, taken together, are well done; while the new chapter on complex quantities is particularly valuable in many calculations of alternating-current networks for steady conditions. The numerical examples, fully worked out in the text, should be of great help in rendering more familiar the employment of complex quantities expressed in terms of polar vectors or of real and imaginary components.

Chapter IV deals fairly adequately with measuring instruments, and includes descriptions of the action of different wattmeters, frequency and phase meters, the oscillograph, and a short account of an impedance bridge. The alternator, introduced by a description, with many diagrams, of stator windings, is followed by accounts of alternator construction and the calculation of the e.m.f. Regulation and other problems relating to alternator characteristics are then considered, and the usual methods of voltage prediction under various loading conditions explained. The method recommended by the American Institute of Electrical Engineers is included.

Transformers, induction and single-phase commutator motors, synchronous motors and convertors each have a section of about 120 pages, and notwithstanding the limits imposed by the size of the book, receive adequate treatment. Contrary to what is found in so many American text-books, which endeavour to cover such a wide field, proper theoretical exposition and vector representation of working principles are not neglected in favour of photographs which convey little more than the appearance of machines and apparatus. Typical three-phase transmission line calculations are given in connection with the transmission of power by alternating currents, assuming, of course, short lines with lumped constants.

A new chapter appears in this edition entitled "Electron Tubes." This proves to be a popular account of the properties and principal applications of the thermionic valve. The action of the valve as an amplifier, rectifier and oscillator is given in an easy fashion, but the explanation offered of the leaky condenser in connection with the rectifying action of a detector valve is not at all satisfying, although quite plausible.

The concluding chapter on illumination and photometry finds a place in this book on alternating currents, because the subject is "important in a general course in electrical engineering." The main facts are stated, but the more recent developments are too much obscured by generalities.

The questions and problems at the end of the book are very varied. Many of them are repetitions, others like "define a transformer" are of doubtful usefulness, but the numerical examples, which have a direct bearing on the text, should be useful to students and teachers.

NEW SWITCHGEAR ASSEMBLY SHOP.

Manufacturers' New Plant in Full Production—Special Provision for Rapid Assembly—Unique Testing Equipment—A Heated Storeroom for Insulating Materials.

THE new building recently added to the Trafford Park works of the Metropolitan-Vickers Electrical Co., Ltd., is designed chiefly for the assembly of metal-clad and outdoor switchgear, including large high voltage oil current-breakers. and is supplementary to the older works switchgear departments, which, including the main switchgear aisle 900 ft. in length, are still given up entirely to switchgear manufacture. This building, undertaken a little over a year ago, has recently been put into full production. It consists of a single-storey open-type shop, 420 ft. in length and 220 ft. in width, with provision for extensions to several times the present size. In its structure, its lay-out and its equipment it has many interesting features and constitutes an excellent example of modern factory planning. It provides for the assembly, testing, and handling of switchgear units up to the largest sizes, and for the highest voltages which are likely to be employed in transmission systems. It has special provision for the rapid assembly of standardised units and for the testing of all kinds of apparatus at the place where it is assembled in the shop, thus obviating the trouble and delay of moving equipment in and out of a test area. The test supplies, even at the highest voltages, are extended over the assembly area for this purpose, and a system of portable interlocking screens is provided for the safety of operators and others. The testing equipment is of particular importance, including, as it does, a 500 000 V testing transformer and a Schering bridge equipment for measuring the energy losses in insulation at working pressures up to 390 000 V. The latter equipment, which has been constructed by the Metropolitan-Vickers Electrical Co., is claimed to be the only one of its kind built or installed in this country, and probably the first in the world to be installed for use up to so high a voltage.

Effective Lighting.

Like the main works, the new building consists of a steel framework with brick walls filling in the girder structure. The roof is saw-toothed, the northern side of many sections being of glass, as are also both sides of the large section of roof at the northern end. The roof lights, together with large windows provided in the north wall, give very effective natural lighting.

The floor of the building is of reinforced concrete faced with a special variety of red brick. The new roads which serve the building are also of reinforced concrete. Railway communication has also been provided, extension lines which connect with the main railway systems being laid into the north end of the building, and four lines are laid into the

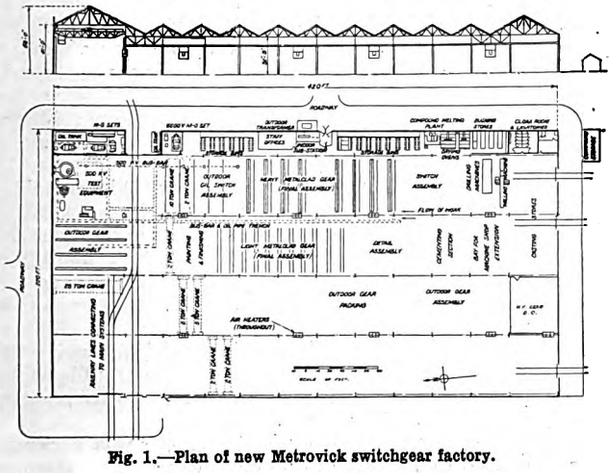

Fig. 1.—Plan of new Metrovick switchgear factory.

south end from the shunting system of the works. Heating and ventilation are provided by a series of steam-heated air-circulation units. The system circulates the air at the rate of 1·61 changes per hour, and has a heating capacity of 4 690 000 B.Th.U. per hour. The artificial lighting is of a high standard, and includes 30 lamps of 1 000 W in concentrating reflectors, mounted 40 ft. from the floor, and 92 lamps of 500 W in angle reflectors mounted 16 ft. from the floor.

Fig. 1 shows the lay-out of the equipment and operations, while Figs. 2 and 3 show typical views of the assembly bays, with switchgear of various types in course of construction. Fig. 2 shows also one of the features of equipment introduced to facilitate the work of assembly, namely, the use of mounting plates let into the floor in such positions that they serve as temporary mounting bases for the assembly of units of different sizes. As seen in Fig. 2, and indicated in Fig. 1, the floor plates for metal-clad units are arranged to suit various sizes of supporting frames. Fig. 3 gives a general view over

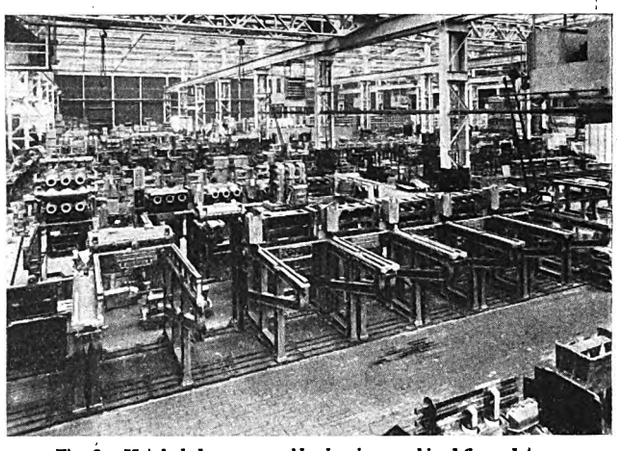

Fig. 2.—Metal-clad gear assembly showing machined floor-plates.

the area in which circuit-breakers of the outdoor type are assembled. The units seen in this illustration are a small part of orders for 132 000 V and 115 000 V gear for the British "grid" and for transmission systems abroad.

As noted on Fig. 1, the flow of work in each assembly bay is from south to north. The assembly bays are served by seven travelling cranes ranging from two tons to ten tons capacity, while the north-end bay is traversed by a 25-ton travelling crane, and has a small jib crane in the test area. The travelling cranes are all equipped with motors, control gear and protective panels of Metrovick manufacture.

Notable Shop Equipment.

Several items of shop equipment are worthy of special mention. One of these is a heated storeroom in which all bushings, bakelite and other insulating materials are stored until they are required for use. In order to prevent the deterioration which might result from moisture condensing on these materials, the room is maintained at a temperature of 15 to 20 deg. F. above the atmospheric temperature. Adjoining the heated bushing store are two drying ovens, one 12 ft. high, 7½ ft. wide, and 14 ft. deep, the other 7½ ft. high, 11½ ft. wide, and 14 ft. deep. The former oven is used in conjunction with the assembly of porcelain rainsheds on high voltage condenser bushings. The porcelain rainsheds undergo a preliminary drying out before assembly, and the rainshed on the assembled terminal is submitted to prolonged drying out before compounding. The latter oven finds its chief application in the drying out of castings before compound filling in the case of the higher voltage metal-clad switchgear, and also for a large quantity of miscellaneous work.

A special plant of improved design is installed to facilitate the melting and pouring of the bitumen compound which is used extensively in metal-clad gear. The plant consists of two boilers fitted with motor-driven stirring paddles to prevent excessive local heating of the material. The plant is installed in a convenient position opposite the detail assembly sections, and most of the filling of apparatus is done direct from the boilers. For operations in other parts of the shop the compound can be conveyed in a crane ladle. As most of the machining operations are done in the main shops the machine-tool section is limited in extent. The equipment includes a double-headed, double table, horizontal milling machine for machining the side frames for metal-clad gear, a number of radial arm drilling machines fitted with direct motor drive for both pillar and saddle, and a number of small drilling and grinding machines.

The supply of power for services in the buildings and for

C

Digitized by Google

testing purposes is brought by means of a new 6 600 V feeder, which has been laid from the main works sub-station to an outdoor sub-station, and an indoor sub-station provided at the east side of the new building. The outdoor sub-station consists simply of a weatherproof transformer mounted, together with the necessary isolating switches, in an enclosure of expanded metal screen work. The transformer

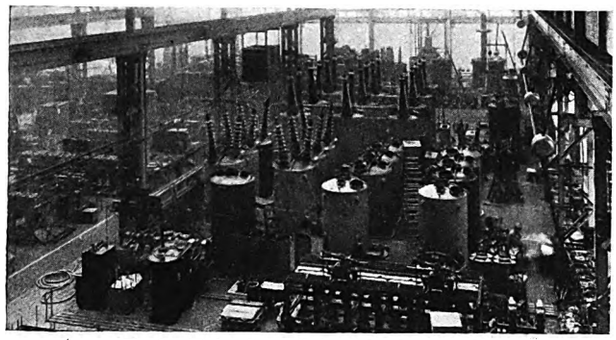

Fig. 3.—High voltage oil circuit-breaker assembly.

is of 625 kVA capacity, giving its output at 440 V, three-phase, 50 cycles for general use, including the supply to the cranes, heater fans, shop lighting and testing. The indoor sub-station equipment includes a motor generator set consisting of a 6 600 V synchronous induction motor driving a 500/250 V direct current generator which supplies a three-wire system for the variable speed motor drives and for testing purposes.

The arrangements for testing are marked by interesting and novel features. It has already been mentioned that the equipment includes a 500 000 V transformer, and a Schering bridge equipment, for direct measurement of energy losses in insulation under working stresses up to 300 000 V, and apart from these items of the equipment, a new principle has been introduced. In place of the usual practice of bringing finished apparatus into a test area, the requisite supplies are made available throughout the assembly areas. The principle has been extended even to the supply at 500 000 V, involving the design of a 500,000 V busbar which itself is believed to be unique in switchgear factory equipment. The 500 000 V transformer is seen on the extreme right of Fig. 4, which shows also, in the centre, the large air condenser of the Schering Bridge equipment, and on the left, an oil tank with condenser type bushings mounted for test, and an oil circulating pump. Another oil tank, 18 ft. in length, has now been installed between the transformer and the condenser, as shown in Fig. 1, to provide for tests on high tension terminals completely immersed in oil. Both oil tanks are fitted with automatic temperature control. The supply to the transformer, which has a ratio of 1 000 / 500 000 V, is provided by a motor generator set housed in the adjoining annexe, the voltage being regulated by means of a motor operated rheostat in the alternator exciter field, the alternator giving a true sine wave voltage curve at varying frequencies. The complete control of operation, whether of the transformer alone, or with the Schering bridge equipment, is effected by means of push buttons from a control desk on a gallery which commands a view of the whole of the test equipment and the area into which the high voltage supply is extended. The equipment of the control desk includes a crest voltmeter which gives direct indication of the high tension pressure. Provision is made near the 500 000 V transformer for the production of artificial rain, so that high voltage tests may be made under wet weather conditions.

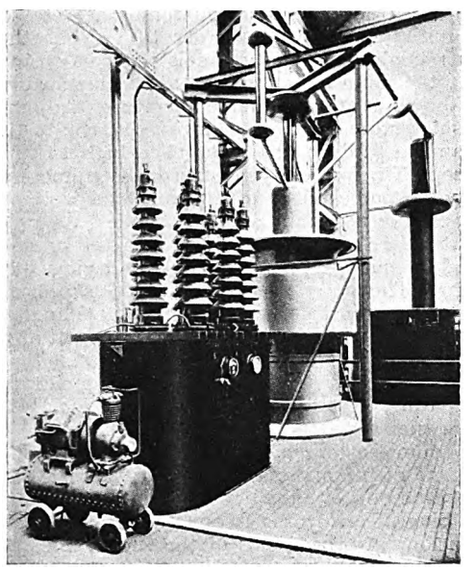

Fig. 4.—500 000 V transformer, with Schering bridge condenser and 132 000 V condenser-type terminal bushings under test.

The high voltage testing supply is carried over the assembly area for outdoor gear by means of a collapsible busbar running from the transformer throughout the length of the erection bays. The supports are bakelite tubes, compound filled and shielded from brush discharge by aluminium spinnings carried on the busbar. When not in use the busbar is lowered into a convenient position close to the stanchions.

For tests at from 2 000 V to 120 000 V a number of portable equipments are provided. The largest comprises a 440/120 000 V 50 kVA transformer with an induction regulator and control panel with a crest voltmeter, which form a separate portable unit. Other equipments provide a.c. testing supplies up to 35 000 V, 10 000 V and 2 000 V respectively.

Close on each tapping on the busbars is a pipe connection with oil under pressure for filling circuit-breaker tanks quickly by means of flexible pipes. As the motor-driven oil pump is reversible the same connections can be used for pumping the oil back to the storage tanks.

Even in the short time during which the new works have been in commission, the whole organisation has thoroughly justified itself, and we are given to understand that it has shown a marked improvement on previous practice with regard to convenience and efficiency of operations in this branch of the company's work.

CABLE SUBWAY FIRE.

Important Recommendations Made by London Inquest Jury.

DR. F. J. Waldo, coroner for the City of London and Southwark, and a jury, concluded last week an inquiry into the cause of the fire which occurred on the night of June 6th in the telephone subway under the Victoria Embankment, London.

The coroner said three other fires had occurred under the Victoria Embankment in the last nine months, and in each case the cause had been determined as due to the ignition of combustible material by sparking from electrical apparatus and cables. All these fires were discovered shortly after the switching on of the electric current for lighting the Embankment. The jury at the inquiry into the cause of the fire of September 8th last, expressed the opinion that the London County Council's electric lighting system was obsolete and dangerous.

Mr. C. A. Baker, divisional electrical engineer to the London County Council, said if a fire were burning in the subway the heat might readily damage the insulation of the cable to such an extent that the fuse would blow. A new electric lighting system was approved by the Council on January 16th, and the work was now well advanced. The new system ran the cables under the footpath, and not in the subway.

Mr. Baker added that the voltage in telephone cables was only 5 or 6. He thought it would be satisfactory to have the high voltage cables in a subway.

Mr. E. Gomershall, G.P.O. superintendent engineer, said the linking up of the lighting leads of the refuge lamps with some other wires might have caused the trouble. Another cause could have been short circuiting in the refuge lamp leads. The leads to the refuge lamps had no metal covering. The work was of a makeshift character and, in his opinion, was unsound.

Mr. W. J. Jeffrey, distribution engineer to the Charing Cross Electricity Supply Co., did not agree that the trouble arose in the connection between the armoured cable and the vulcanite india-rubber leads to the refuge.

The jury returned a verdict that the fire was accidental, and was caused by sparking at a defective porcelain connector temporarily used by the L.C.C. to replace the cut-out or switch-box formerly placed at the junction of the main cable with the overhead lighting cables. They recommended that the Exchange Telegraph Company be requested to replace the gutta-percha insulation of their cables by a more recognised and efficient method of insulation. They added riders recommending that all cables carrying over 200 V be removed from the subways and that all subways should be permanently wired for lighting according to the Institution of Electrical Engineers' rules, so as to eliminate all portable means of illumination.

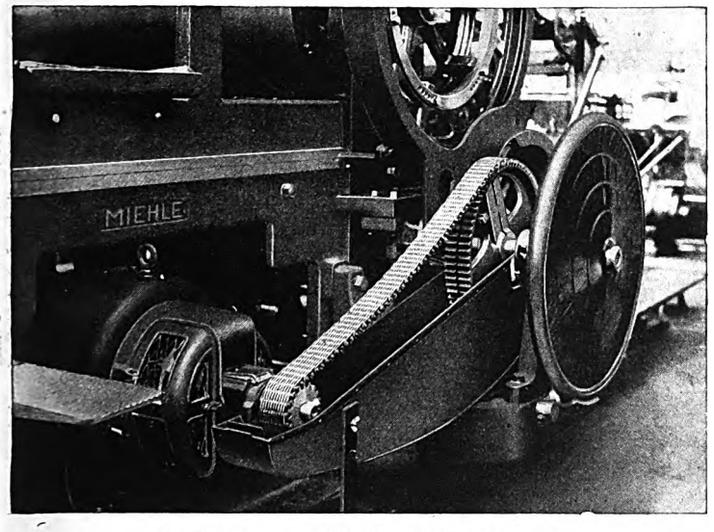
MANUFACTURERS' EQUIPMENT.

Extinguishing Devices for Electrical Fires—Automatic Systems of Fire Protection—Chain Driving of Works Machinery.

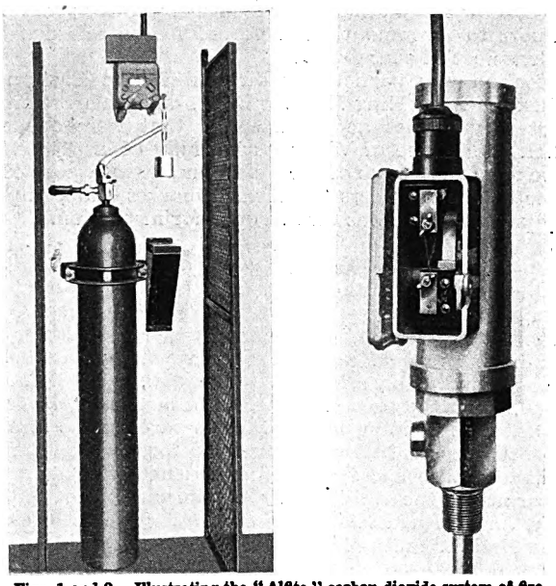
IN connection with the increasing popularity of chain gearing for power transmission, some details of the Morse chain drive may be of interest to our readers. With all chain drives there are the obvious advantages of positiveness and the feasibility of using short centre distances, thus often enabling floor space to be saved by placing motors on brackets close to the lineshaft. Moreover, chains require little attention, and, if of the silent type, run with a marked reduction of transmission noise. The Morris rocker-joint chain drives, manufactured by THE MORSE CHAIN CO., LTD., of Letchworth, Herts, which were formerly known as Westinghouse Morse chains, have now been considerably improved, and are claimed to be distinctly superior to the ordinary round pin chains, with their liners or bushings. In a Morse chain, the joint consists of two hardened steel pins—the one rocking on the face of the other as the chain passes on and off the wheels. These pins are locked in alternate driving links, but have clearance on their backs in the intermediate links; the process is reversed in the opposite holes of the links. As a result, there is no sliding friction between links and pins, while between the pins themselves there is no sliding friction but only a rocking motion as the one pin, termed the rocker pin, rocks over the face of the other, termed the seat pin. An important gain in mechanical efficiency is thus obtained. Furthermore, wear at the joint is reduced to a minimum, while the construction is not so dependent on elaborate lubricating devices as some other methods of link connection. The rocker pin normally extends the whole width of the chain up to and including the outside link, while the seat pin also extends through the complete width, but has a shoulder on either side, beyond the outside of the link, on to which are driven washers, secured by a riveting construction. In this way, the links are held in place on the pins, and the rocker pin has perfect freedom—when actuated by the links with which it is fixedly connected—to rock over the face of the seat pin. The chain thus has the merit of a full bearing the width of the chain, in contradistinction to chains in which bushings, holding two or more link plates together, bear against a round pin.

The link form of the Morse chain is so designed in conjunction with the shape of its wheel teeth that when, ultimately, wear takes place, the chain takes up a higher position on the driven wheel teeth; all units in contact continue to take their share of the load, so that this link form may be described as of the compensating type. Morse chains are made in 12 standard pitches, and up to 30 in. maximum width. Sprockets from 13-T up to about 130 are generally used. Drives in operation range from fractional H.P. at 2 500 r.p.m. to 1 000 H.P. at 200 r.p.m. The accompanying illustration shows a 6 H.P. Morse chain drive to a Miehle printing press.



A 6 H.P. Morse chain drive to a Miehle printing press.

The "Alfite" carbon dioxide system of fire protection developed by FOAMITE FIREFOAM, LTD., 55-57, Great Marlborough Street, London, W.1, has several interesting features. The merits of CO_2 as a fire extinguishing medium in cases where air is sufficiently confined to be easily diluted by the gas are generally known, but it may be mentioned here that it is non-poisonous, does no damage to materials, leaves no residue, and is a non-conductor. The last fact is an important advantage when it is necessary to extinguish fires which have broken out in h.t. equipment, as it is not essential to kill exposed terminals. A single battery of "Alfite" cylinders, suitably arranged in a power station, is claimed to give adequate protection for generators and other rotating equipment, switchgear and transformers. Provision for automatic closing of air ducts is made when the open system of cooling is in use with rotating machinery; by means of a time-delay unit the "Alfite" gas can be admitted to the space between rotor and stator at intervals, in order to maintain the required proportion of CO_2 until the rotor comes to rest and re-ignition of insulation is impossible. In the instances of transformers and switchgear, means are provided for flooding with gas the spaces above the oil, so that the burning liquid is smothered and time allowed for its temperature to fall below the flash point. Differential relays operate the cylinders and directional valves when the system is automatic. A special feature of the "Alfite" system is the cylinder discharge valve, in which one copper disc seals the cylinder and acts as a safety valve, while the same orifice is used for recharging. The possibility of leakage is thus reduced to a minimum. Discharge is effected by depressing the valve cutter, which may be accomplished manually or automatically: the operating head, which is screwed on to the cylinder valve, varies according to the nature of the risk to be protected. In one form of automatic operation the lever head is so arranged that downward motion cuts the disc: a weight is attached to the end of the lever, which is suspended from the arm of a "Lowe" release connected through conduit with an actuator placed near the risk.



Figs. 1 and 2.—Illustrating the "Alfite" carbon dioxide system of fire protection.

In Fig. 2 is shown the head used in another method of operation. When an outbreak occurs a current is passed through the fuse wire shown, by automatic or semi-automatic means. Immediately this wire breaks, a weight in the cylindrical portion of the head drops, and depresses the cutter of the valve, so piercing the disc. In addition to "Alfite" permanent installations, in which each cylinder may have a capacity of 50 lbs., Foamite Firefoam, Ltd., supply portable extinguishers containing about 7 lbs. of liquid gas. These are recommended for fires involving telephone switchboards.

SOUTH MIDLAND I.E.E.

Inspection of the Electrical Equipment in Use at the Port of Bristol.

ABOUT 120 members and friends of the I.E.E., South Midland Centre, on July 2nd, spent an instructive day studying the application of electricity to the loading and storage of foodstuffs, and harbour engineering generally, at that very favourable locality, the Port of Bristol. The party was efficiently conveyed from Birmingham by the Great Western Railway in special dining-cars, in which lunch was served on the way down and dinner on the return journey; while local transport to Avonmouth and Clevedon was afforded by an excellent fleet of charabancs.

Attention was particularly directed to the Eastern Arm Extension of the King Edward Dock, on which are situated the great granaries and cold stores that were opened by H.R.H. the Prince of Wales during May of last year. The Centre were the guests of the Port Committee, whose officials conducted the members about the wharves and equipment, every part of which was thrown open for inspection.

Electrical Applications.

A start was made at the frozen meat stores, where electrically driven ammonia refrigerators and long distance electrical thermometers were first demonstrated. The latter were especially interesting, the temperatures throughout the great building being at once indicated on a dial, by the resistance method, upon the pressing of one of a large battery of push buttons, corresponding to the various parts of the structure. The electric goods lifts were employed for the conveyance of the visitors, who had the novel experience of plunging from the warmth of the West Country summer to the cold of midwinter, and of then wandering among thousands of carcases of New Zealand mutton and pork that were awaiting distribution.

The grain is unloaded from the ships by suction conveyors, assisted by electric capstans and cranes, the whole requiring over 3 300 H.P. of induction motors. These have been installed by the English Electric Co. and are almost all of the squirrel cage type; but the majority are of the high torque pattern. The operation of the cranes, which is more usually carried out by direct current, is notable in that two-speed squirrel cage machines are employed, controlled by Igranic contactor gear, almost entirely by means of direct switching and pole changing.

The enormous capacity of the grain stores, as well as the convenience and economy of the transport equipment, excited the admiration of the visitors. The actual storage is accomplished in tall compartments known as silos, each of which is 4 ft. square and 90 ft. high. Numerous belt conveyors of about one third of a mile in length are responsible for the horizontal movement of the grain.

Thanks to the courtesy of the local staff, the modern equipment and methods were inspected in a very pleasant manner; and the gratitude of the Institution was voiced by the Chairman, Mr. S. H. Holden, at the conclusion of the complimentary tea provided by the Harbour Committee, at which Mr. Hartley Hodder formed the genial host.

After leaving the docks, the conveyances took the party through the picturesque environs of Bristol, reaching the sea coast at Clevedon, where a halt of about an hour was made, the return to Temple Meads Station being effected by a different route.

The Midlanders were much impressed by the fine architecture both of the public and domestic buildings in the district through which they passed, in every way worthy of a city which was second in importance only to the capital in the days when architecture was a living art. The Gloucester and Somerset scenery through which the route to Avonmouth and Clevedon lay was looking its best in the pleasant weather. Hay meadows alternated agreeably with wood-clad hills and old-world villages; while the rural distribution activities of the Somerset Electric Power Co., though sufficiently unobtrusive, were a constant reminder that our Western colleagues are not neglecting their opportunities.

On a grander scale were the limestone gorge of the Avon and its suspension bridge, which were inspected both from below and from above. The staff work was excellent throughout the day, and it was a highly satisfied band that reached Snow Hill in the evening.

A selection of reproductions from snapshots illustrating various phases of the tour is printed on the opposite page.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Mains Operated Wireless Sets.

[TO THE EDITOR.]

SIR,—Your correspondent, Mr. W. I. Jones, in your issue of June 21st, states that "every wireless set, whether mains operated or not, clicks when a light is switched off or on." That is a very sweeping statement, and it would be interesting to know whether Mr. Jones attributes such pick-up to (1) the aerial, (2) the set, or (3) the earth. If it *is* due to any of these why is the click so much more pronounced on a mains operated set than with a battery set? Assuming that the noise or click is due to a spark when the switch is made or broken, surely such "transmission" should be received at equal strength on either set, always providing that the same type of circuit is used.—I am, etc.,

The E.T.B.I. Competition.

[TO THE EDITOR.]

SIR,—I note with interest that the Electrical Trades' Benevolent Institution is to launch a competition with the object of increasing its funds, and the purpose of this letter is not only to wish the organisers of the competition every success, but to express disappointment in the fact that such means of raising money are necessary. I suppose the electrical industry may be regarded as one of the most prosperous, and its principals among the wealthy, yet here we have a thoroughly deserving institution finding it necessary to run competitions in order to raise the wherewithal to meet the demands upon its charity.

During the last few years the funds of the E.T.B.I. have been the subject of print in many of the electrical papers, and though my reading extends also to trade papers outside the electrical industry, rarely, if at all, have I seen any editorial reference to similar institutions in other industries. It may, of course, be argued that the trade Press of other industries is not so sympathetically inclined towards charities, but the facts of the case are that other trades make sure that such sympathy is not required.

The E.T.B.I., as everyone knows, has done considerable good, and everyone connected with the industry should not only enter the competition, but should make their donation as much above the 2s. 6d. asked for as they can possibly afford.—I am, etc.,

COMMERCIAL.

Harwich.

Concrete Pole Problems.

[TO THE EDITOR.]

SIR,—In his article on concrete poles printed in THE ELECTRICIAN of June 28th, Mr. W. T. Taylor gives a table which sets out the first cost and annual expenses of wood, steel and concrete pole lines. These tables appear to show that reinforced concrete is undoubtedly the most economical form of construction, but in the absence of details regarding the basis of his estimate of first cost and the manner in which the annual expenses are calculated, it is not possible to make a critical examination of Mr. Taylor's conclusions.

The total figures given apparently include all costs incidental to the erection and maintenance of a line of a certain length, but to appreciate the part played by the type of pole used there should be some splitting up of the over-all figure into poles, wires, etc., and details of the annual expenses would be particularly welcome.

Mr. Taylor's statements on such a matter are of considerable weight, and in view of the importance of this subject perhaps he could be prevailed upon to expand the figures.—I am, etc.

NEWS IN BRIEF.

Plumstead Traders' Suggestion—Hackney and Electric Irons—I.E.E. Contract Conditions —The Patents Committee—Safety First and Insulating Tape.

MEMBERS of the Diesel Engine Users' Association visited Leatherhead electricity works recently.

Isle of Thanet Joint Hospital Board has decided to instal at the hospital at Haine an electric lighting plant at an estimated cost of £3 200.

The short circuiting of a battery in the recharging room of Messrs. A. R. and E. Wallis, wireless and electrical engineers, 41, Torquay Road, Paignton, resulted in a fire on June 27th, which did damage to the extent of £30.

The trunk telephone service was extended to the Isle of Man on June 28th.

Gravesend Town Hall Committee has considered schemes of heating the town hall by low pressure hot water and by electricity and has decided that a sub-committee should view a building heated by electricity before coming to a decision.

The daily average of electricity generated in Canada for Canadian use during December, 1928, and January and February, 1929, amounted to 43 746 000 kWh, 45 912 000 kWh and 44 622 000 kWh respectively, compared with 39 047 000, 38 588 000 and 38 858 000 kWh respectively for the same months of the previous year.

At a recent meeting of the Plumstead Traders' Association, Mr. C. G. Everett put forward a combined lighting scheme whereby the three hundred traders in the district using electricity could co-ordinate their lighting displays to attract extra custom and at the same time obtain their supply from the Council's electricity undertaking at a reduced cost.

An electrical laundry is to be established at Norris Green by the Liverpool Co-operative Society, provided the recommendation of the Liverpool Housing Committee to sell the necessary site to the Society is adopted.

The whole of the Vatican City is to be equipped with an automatic telephone system. Arrangements have been made for the International Standard Electric Corporation to make the installation as soon as possible. The exchange will have a capacity of 1 800 lines, and will have 500 numbers at the outset.

A revision of Manchester Corporation's hire-purchase wiring scheme has been agreed to by the Electricity Committee. A standard schedule price has been fixed, and it is open to any contractor on the National Register to carry out installations for which he can, by canvassing, obtain orders direct from consumers.

Hackney (London) Electricity Committee proposes to put into operation a scheme of hiring electric irons of British manufacture at 1s. a quarter. In the event of hirers wishing to buy their irons, a credit of 50% of the aggregate paid in rental is to be given towards the purchase price. It is estimated that the consumption per iron will be 50 kWh per annum.

Users of the Institution of Electrical Engineers' model forms of general conditions for contracts are reminded that revised editions have been issued as follows:—Form A (Home, with erection), April 1929; Form B1 (Export-delivery F.O.B.), December, 1928; Form B2 (Export, including erection or supervision of erection), December, 1928. In addition, there are available:—Form C (Sale of goods other than cables—Home, without erection), issued, April, 1924; and Form D (Sales of Cables—Home, without erection), issued, April, 1924.

Ripon Gas and Electricity Committee has passed plans of the proposed showrooms, and has decided to obtain tenders.

Nearly 200 persons, from Europe and America, have indicated their intention to be present at the congress of metallurgists in Düsseldorf from September 9th to 12th.

The new rural automatic telephone exchange which has been opened at Aughnacloy in the Clogher Valley, co. Armagh, is the first automatic telephone exchange to be completed in Northern Ireland.

Sir Herbert Baker has undertaken the design of the Victoria Embankment elevations of the new head office of Cables and Wireless, Ltd., and Imperial and International Communications, Ltd.

York Electricity Committee is to apply to the Commissioners for sanction to borrow £10 000 for domestic appliances and £2 000 for assisted wiring.

London County Council Education Committee recommends that, in view of the establishment of the new constitution of the University of London, consideration of the application for a grant of £10 000 towards the erection of a high voltage testing laboratory at East London College be postponed.

At the annual conference of the Institute of Public Cleansing, at Blackpool, Mr. C. L. O'Shaughnessy stated, in a paper on "Electrical Engineering in Modern Cleansing Work," that at Birmingham the major portion of the steam generated by means of the heat from the refuse incinerator was turned into electrical power. The efficiency of the electric refuse vehicle, with its ease of control, still gave it a pre-eminence in that field. A striking apparatus in the handling of house refuse was the electro-magnetic separator.

Associated Municipal Electrical Engineers of Great Britain and Ireland has informed Hammersmith B.C. that the salary which should be offered to the successful applicant for the position of borough electrical engineer and manager, according to the Association's scale, should be £1 415 per annum. In the invitation of applications for the post, the salary offered is £1 200, rising by annual increments of £50 to £1 400. The Electricity Committee does not recommend that the Association's suggestion be adopted.

The Patents Committee under the chairmanship of the Rt. Hon. Sir Charles Sargant has begun its investigations, and persons and associations who wish to submit suggestions or to give evidence before the Committee are invited to communicate with the Secretary, Mr. R. W. Luce, Industrial Property Department, Board of Trade, 25, Southampton Buildings, London, W.C.2. The Committee was appointed by the Board of Trade to report whether any amendments in the Patents and Designs Acts, or changes in the practice of the Patent Office, are desirable.

At an inquest last week into the death of an employee at the Derbyshire and Nottinghamshire Electric Power Co.'s works at Spondon as the result of a shock due to the deceased man having touched a cable joint, Mr. H. W. Swann, a Home Office expert, said the insulation tape commonly used by electricians was not safe, and it had been responsible for a number of fatal accidents. Drawn tightly over a sharp surface, it became brittle and the insulation was impaired. It would be better if the metallic sheathing of the cable were extended. He had known a case in which as many as eight layers of tape had proved ineffective.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *of July 12th, 1879:—*

Members of the International Telegraph Conference were entertained by Mr. John Pender, M.P., at a garden party at Foots Cray.

The need for some sort of standardisation in electrical terminology was receiving attention.

The death was announced of Sir William Fothergill Cooke, who was described in our memoir as "literally the father of English electric telegraphy, and in a not very remote sense, the father also of electric signalling throughout the world."

* * *

TWENTY-FIVE years ago, THE ELECTRICIAN, *dated July 15th, 1904, recorded that:—*

Four out of the 14 clauses of the Supply of Electricity Bill had been passed by the House of Lords Committee.

Bradford Corporation was recommended to purchase 30 500 lamps for free distribution to consumers.

Tenders for wiring a West Ham school ranged from £320 to £960 10s.

* * *

FIFTEEN years ago, it was stated in THE ELECTRICIAN *for July 10th, 1914, that:—*

Dr. Oliver Heaviside was granted an additional Civil List pension of £100.

Explosions in bitumen mains were the subject of the report of a Departmental Committee, of which Sir T. Edward Thorpe was chairman.

Digitized by Google

PERSONAL.

MR. J. McAnaney has been transferred by the Electricity Supply Board from Dublin to Waterford.

Mrs. May M. McDowell has joined the Liverpool electricity showrooms in Whitechapel, as a demonstrator.

Mr. D. M. Pitt has relinquished his post with the Cambridge Instrument Co., Ltd., to return to the domestic side of the industry as London sales engineer to Electrical Utilities, Ltd.

Estate of the gross value of £20 755, with net personalty £19 796, was left by the late Major-General Reginald Henry Mahon, deputy chairman of the Calcutta Electric Supply Corporation.

Mr. Joseph Dickson, post office sectional engineer, Llandudno, has retired after 46 years' service with the Post Office. At a farewell gathering of his colleagues he was presented with a handsome piece of furniture.

The Albert Medal of the Royal Society of Arts for the current year has been awarded to Sir Alfred Ewing, Principal and Vice-Chancellor of the University of Edinburgh, "for his work on magnetism and his services to technical education."

The marriage was solemnised at St. John's Church, The Height, Salford, on June 26th, of Mr. Harry Brooks, a contract engineer with W. T. Glover and Co., Ltd., and Miss Muriel Clarke.

Mr. C. W. Charlesworth, works manager for Marconi's Wireless Telegraph Co., Ltd., at Chelmsford, who is leaving to take up another appointment, has been presented by the staff with a gold cigarette case, together with a gold vanity case for his wife.

Mr. J. D. Peattie, distribution development engineer in the Manchester electricity department, having resigned to take up a position with the Central Electricity Board, the following new appointments have been made:—Mr. H. Hawkins, distribution development engineer; Mr. P. T. Fowler, h.t. mains engineer; Mr. A. W. Crompton, assistant distribution development engineer.

Arrangements have been made for Mr. S. R. Mullard to relinquish his position as managing director of the Mullard Wireless Service Co., Ltd., and the Mullard Radio Valve Co., Ltd., in order to devote more of his time to other interests. Mr. Mullard will retain his offices as chairman of the Mullard Wireless Service Co., Ltd., and director of the Mullard Radio Valve Co., and will be general adviser to the companies.

Mr. H. Francis White, marine contracts manager of the Radio Communication Co., has been appointed manager of that company. After 17 years with the Marconi International Marine Communication Co., Mr. White entered the service of the Radio Communication Co., in 1920, as their agent in the Newcastle area. Two years later he was appointed marine contracts manager at their head office, a position which he has held until his present appointment.

The sequel to Mr. W. H. Peak's resignation as managing director of the Relay Automatic Telephone Co., Ltd., is to be found in the appointment of Mr. B. B. Johnson and Major W. Burningham White as joint general managers. Mr. B. B. Johnson has been associated with the company for many years, and has for the last four or five years been chief engineer. Major W. Burningham White created the sales department of the company and has developed the present sales organisation.

At the conclusion of the summer meeting of the Institution of Mechanical Engineers, honorary degrees of Doctor of Science were conferred by Manchester University upon Mr. Daniel Adamson, president, and Sir Henry Fowler, a past president of the Institution. Sir Henry Fowler is well known as the chief mechanical engineer of the Midland Railway. Mr. Adamson was responsible for the design and construction of the first three-motor electric overhead travelling crane ever built in this country.

At the last meeting of the Pretoria Town Council, Mr. L. L. Horrell was appointed electrical engineer and manager at the Electricity Department, at a salary of £1 200 to £1 375 per annum. Mr. Horrell has been connected with the department as assistant electrical engineer for the last twenty years. Before going to South Africa, Mr. Horrell may be remembered being on the staffs at Bedford, Coventry, and Walsall electricity undertakings. His early mechanical training was gained at the old Great Northern Railway works at Peterborough.

Mr. D. Wyles, late chief of the radio department of the National Electric and Engineering Co., Ltd., of New Zealand, has been presented by the Electrical Federation of New Zealand with four bound volumes of gramophone records as a mark of appreciation by the trade for his work in connection with the improvement of local radio trade conditions. The presentation was made at an official farewell gathering prior to Mr. Wyles sailing for Melbourne to take up the position of sales promotion manager of Philips Lamps (Australia), Ltd.

Mr. A. J. Railing, who has been asked to become joint-managing director of the G.E.C.

One of the most interesting statements made by Sir Hugo Hirst at the general meeting of the G.E.C. last week was that expressing his intention to ask Mr. A. J. Railing to become joint-managing director. Mr. Railing has held his present office of general manager for the last 18 years, having been with the G.E.C. for 38 years. During the absence of Sir Hugo in Australia with the Government Mission, much additional responsibility rested upon Mr. Railing, and Sir Hugo, when making the announcement of the impending appointment, paid tribute to the success with which the work of the company was carried on. Much of the company's progress is attributable to the outstanding capabilities which Mr. Railing has brought to bear, the expansion of the company both at home and overseas making the office of general manager increasingly arduous. It is fitting, therefore, that such abilities should be given greater scope, and though the position he is shortly vacating has shown to advantage the courage and rare capacity for detail which are not the least of Mr. Railing's qualifications, still greater success may attend the new appointment.

The Council of the Institution of Electrical Engineers has made the following award of Students' premiums for papers read before the Students' Sections during the Session 1928–29: PREMIUMS OF THE VALUE OF £10 EACH: E. J. Evans, "Food Heating by Extracted Steam in Generating Stations"; R. C. Henniker, "The Commercial Testing of Power Transformers"; F. Roberts, "Errors in Current and Voltage Measurements at High Frequencies." PREMIUMS OF THE VALUE OF £5 EACH: V. E. Connor, "The Manufacture and Testing of Submarine Telegraph and Telephone Cables"; T. A. Long, "The Loading of Transformers on a Thermal Basis, with Special Reference to Temperature Indicators"; V. P. Mackay, "Power Factor Correction"; C. F. J. Morgan, "The Resonance Method of Wave-Form Analysis"; H. H. Taylour, "Electric Welding"; and D. J. Watkins, "Electric Locomotives."

Obituary.

Mr. ALEXANDER D. GOODALL, aged 72 years. He was for 40 years in business as an electrician at 4, East Norton Place, Edinburgh.

Mr. RICHARD FREDERICK CLARKE, on June 25th, aged 52 years. Mr. Clarke was in business as an electrician at 10A, Park Lane, Folkestone.

Mr. SIDNEY O. ALLEN, district manager of the North-Western area of the Post Office telephones. He resided at Westmorland Road, Southport.

Mr. WILLIAM WILD SMITH, on June 10th. He was in the Engineering Department of the Post Office and was an associate member of the Institution of Electrical Engineers.

Mr. WILLIAM SYMES ANDREWS, on July 1st, at Schenectady, aged 81 years. Mr. Andrews was a pioneer in electrical engineering, and was for many years assistant to Edison. He constructed the first Edison chemical electric meter, and was responsible for patents in connection with X-rays. He was a martyr to scientific progress, his death being traceable to X-ray burns. He was born at Saltford, Somerset, and went to America, where, in 1881, he became superintendent of testing at the Edison Machine Works, New York. He was afterwards chief electrical engineer of the Edison Electric Construction Co., general superintendent of the Marr Construction Co., vice-president of the Leonard and Izard Co., superintendent of the Edison Manufacturing Co., New York; technical assistant at the Edison General Electric Co., superintendent of the Peterborough Works of the Canada General Electric Co., and general manager of the Edison Electric Illuminating Co., Lancaster. Since 1894 he had been with the Edison General Electric Co.—during recent years as consulting enginneer.

LEGAL INTELLIGENCE.

The Barton Station—Trade Name Injunction —Loud Speaker Patents.

THE petition of Erewash Electric Wire Co., Ltd., for a compulsory order to wind up Telephones and Accessories, Ltd., was dismissed by Mr. Justice Eve in the Chancery Division on July 3rd.

Mr. Johnston said it was a judgment creditors' petition which had stood over on two occasions to enable the parties to come to terms. They had done so, and he asked that the petition should be dismissed without costs.

Mr. Justice Eve: Your request is granted.

Alleged Nuisance.

Adverse judicial decisions upon alleged nuisances arising from the emission of fumes from the Barton power station of the Manchester Corporation came this week, in the House of Lords, for review and final decision, in the appeal of the Manchester Corporation *v.* Mr. Arthur Farnworth. Mr. Justice Talbot, before whom the matter first came, decided in favour of the Corporation, but the Court of Appeal set aside his decision and entered judgment for the respondent. The Corporation now appealed to the House of Lords.

Electric Lamp Patents.

Judgment in default of defence was entered by Mr. Justice Clauson in the Chancery Division on Tuesday in actions by the British Thomson-Houston Co., Ltd., against Charles Marks, trading as the Standard Supply Stores, Higher Broughton, Manchester, and J. Howard, Temperley Road, Balham, to restrain infringements of their patents relating to improvements in incandescent electric lamps.

Edison Accumulators *v.* Edison Storage Batteries.

In the Chancery Division on July 2nd Mr. Justice Clauson heard a motion on behalf of Edison Accumulators, Ltd., against Edison Storage Batteries, Ltd., for an interlocutory injunction to restrain the defendant company from carrying on business under their present name or any name calculated to lead to confusion.

The Hon. Stafford Cripps, K.C., for the plaintiffs, said the Accumulator and Storage batteries were the same. The defendants were an English company which had been promoted by an American company of the same name. In 1913 an agreement was entered into between the American company and the Edison Accumulators, Ltd., plaintiffs' predecessors in title, when the American company had a number of patents in this country for protecting the manufacture of their accumulators. Those patents had since lapsed, and the effect of the agreement was to give plaintiffs' predecessors sole selling rights of Edison accumulators except the sales to Government. The agreement continued in force until March, 1925, when it was substituted by another agreement for a period of five years, with a provision for 90 days' notice to terminate in the event of any breach.

In July, 1929, the original Edison Accumulators, Ltd., split themselves into two companies—Britannia Batteries, Ltd., and Edison Accumulators, Ltd., the last-named to have the benefit of the agreement of March, 1925. On March, 19th, 1929, after the present plaintiff company had been registered, notice was received from the solicitors to the American company purporting to terminate the agreement on the ground that there had been breaches. On April 8th, 1929, the defendant company was registered as a private company to carry on business of, amongst other things, selling accumulators in this country. What really had happened was that the American company cancelled the agreement, on the allegation that there had been breaches which were denied, and had formed the defendant company to carry on the same business in this country. There were two considerations: one was whether, apart from the agreement, the American company could register a private company and carry on business under a name which was identical with the plaintiffs' name, and whether in view of the agreement they were stopped from so doing. Counsel submitted that the name of the defendant company so closely resembled plaintiffs' that there was bound to be confusion, and the plaintiffs were entitled to the injunction.

Sir Duncan Kerly, K.C., for defendants, submitted that there would be no confusion. The name and description of the goods which were sold and the mere use of an honest description of goods could not be stopped.

His Lordship, granting an interlocutory injunction in the terms of the notice of motion, said he was satisfied that it would be impossible for defendants to trade under their present name without causing some confusion.

On the application of Sir Duncan Kerly, his Lordship suspended the injunction pending notice of appeal.

Lektophone *v.* S. G. Brown.

The Court of Appeal, consisting of the Master of the Rolls and Lords Justices Lawrence and Russell, heard on Monday an appeal by the Lektophone Corporation, of Exchange Place, Jersey City, U.S.A., from a judgment of Mr. Justice Tomlin in the Chancery Division in an action brought by the appellants against S. G. Brown, Ltd., of Victoria Road, Willesden Lane, London, W., to restrain an alleged infringement of their patent, No. 16602, granted in 1914.

Mr. Trevor Watson, who appeared for the Lektophone Corporation, explained that the defence of the action was non-infringement and invalidity, and Messrs. Brown counter-claimed for revocation.

The case was one of considerable importance, because there was large commercial activity to-day in the wireless loud speaker, which was the type of machine Messrs. Brown had put on the market, and which the Lektophone Corporation alleged was an infringement of their patent.

The Lektophone Corporation complained that Messrs. Brown had sold a loud speaker called "The Mascot" at the National Radio Exhibition in September, 1927, which was alleged to be made in accordance with the appellants' specification.

Mr. Justice Tomlin held that the appellants' specification referred to sound regenerating machines called talking machines and phonographs operated by a stylus and records, and without a horn or trumpet, and not to loud speakers in the modern sense for transmission of wireless sound waves.

His Lordship held that "The Mascot" did not infringe the appellants' patent and upheld the validity of the patent. He accordingly dismissed the claim and counter-claim. From that decision the Lektophone Corporation now appealed and Messrs. Brown cross-appealed.

Mr. Trevor Watson dealt in detail with the factors which govern sound and the methods employed to produce it, and said that his general criticism of Mr. Justice Tomlin's judgment was that his lordship dealt with the matter too exclusively upon the wording of the specification without paying sufficient regard to the evidence which had been given as to the state of the art and as to the problems with which the inventor was really dealing.

Hearing adjourned.

IN PARLIAMENT.

Electrification Schemes amongst Works Proposed by Government to Relieve Unemployment.

IN the course of the debate on the Address, in the House of Commons on July 4th, the Chancellor of the Duchy of Lancaster (Sir O. Mosley) said the Liverpool Street Station electrification scheme, if it went through, would involve orders of between £75 000 000 and £100 000 000, which would go very largely to the steel trade. The present Government was setting to work again the Lord St. Davids Committee, on a basis in which it could properly function. If the Committee sanctioned schemes of public work at the same rate as formerly, it would mean that 150 000 men would be employed annually.

Sir L. Worthington-Evans questioned the accuracy of the figures of £75 000 000 and £100 000 000.

Sir Herbert Samuel said with regard to the Liverpool Street Station scheme, they had been told that the Government were proposing to allot a sum for that purpose of from £75 000 000 to £80 000 000.

Mr. J. H. Thomas said they did not intend anything of the kind. If a proposition of that kind could be self-supporting in one, two, or three years, it would be madness for any Government to give a guarantee for ten or fifteen years.

Replies to Questions.

The following are points from recent answers to questions in the House of Commons:—

The Electricity Commissioners are in communication with the Law Society with a view to the provisional settlement of a draft of a proposed form of wayleave agreement, and they propose to submit the draft to associations of the electricity supply industry, and to landowners and farmers and other interested parties.

I.E.C. DINNER.

Delegates of the International Electrotechnical Commission in London.

THE British National Committee in association with the Steam Turbine Section of the B.E.A.M.A., gave a dinner at the Hyde Park Hotel, London, on July 4th, the guests of honour being the delegates of the Advisory Committee on Steam Turbines of the International Electrotechnical Commission, now in London.

Mr. CHARLES P. SPARKS (chairman), in proposing the toast, "The Visiting Delegates," said that the I.E.C. was now supported by the committees of 25 nations, the latest supporter being Portugal. The latter country was considering schemes of electrification and as a potential purchaser saw the advantage of being in direct touch with this parliament of electricians and following the debates. Having been connected with the activities of the I.E.C., since its first meeting in London in 1906, he expressed a word of warning to the effect that the electrical field internationally was in danger of becoming confused owing to too many international congresses and conventions. The multitude of congresses was bound increasingly to lead to overlapping. Moreover, it was a heavy tax on both the manufacturing and professional interests to send representatives to attend these innumerable meetings and yet they were forced to do so as they were bound for their own interests to maintain touch with international opinion. Some co-ordination was necessary in the general interests. The I.E.C. had taken the initiative in forming a Comité d'Entente, which was a clearing house for dates of international meetings and the exchange of ideas on the various programmes of work. This, however, was not far enough and it was hoped that some definite steps would eventually be taken towards bringing about a solution of this growing overlapping of efforts. The I.E.C. had now won its position as the official channel for promulgation in national recommendations in all matters relating to standardisation in electrotechnics.

PROF. CLARENCE FELDMANN, President of the International Electrotechnical Commission, in responding to the toast, said that he was fully aware of the danger of the existence of so many independent international organisations in the same field, which approach each other sometimes, and sometimes trespass on each other's work. The Comité d'Entente had done much, and it was hoped would do more, to prevent overlapping of dates of international meetings, but it could not go very far. The men delegated to attend these meetings were always men of high standing, specialists and experts, and neither Governments, municipalities, nor indeed industry itself, were able to give these people so much leave as would be necessary for them to visit the majority of the international meetings. If we went on in the way that we were going we should have a new type of man coming into being who attended all international meetings, and did nothing else.

The I.E.C. and the B.E.S.A.

Mr. MAURICE WILSON, Chairman of the British Engineering Standards Association, stated that he believed that the I.E.C. owed its inception to Col. Crompton who suggested its foundation some 25 years ago. The B.E.S.A. was founded somewhere about the same time by Sir John Wolfe Barry, and the two bodies have grown up in close and friendly relationship for more than a quarter of a century. The B.E.S.A. took the keenest interest in the work of the I.E.C. and recognised that body as the official channel through which international recommendations regarding electrotechnical matters were promulgated.

Dr. W. F. DURAND, leader of the delegates for the United States of America, in reply to the welcome, said that though he had heard references to the first meeting of the I.E.C. in London in 1906, members in the United States had been taking an agreeable satisfaction in believing that the birthplace of the organisation was at St. Louis in 1904. There was a rather simple explanation of the reason why engineers were able to act as pioneers in the development of international understandings and organisations. Fundamentally the engineer the world over thought in terms of the same basic units and ideas. There might be differences of language, terminology and symbols, but the ideas at the bottom were the same.

On Friday, July 5th, members and friends numbering about 60 in all, and including about 25 foreign delegates, and a number of lady visitors, had an enjoyable all-day outing, which began by a train journey to Oxford and was followed by visits to some of the Colleges; an excellent luncheon at the Carfax Assembly Rooms, and a motor coach jaunt to Hurley Lock. Here the party embarked for a delightful four-hours' trip to Windsor, at which place the motor coaches were in waiting to complete the journey back to London.

After the luncheon, at Oxford, Mr. Pyk, a Swedish turbine designer, expressed the foreign delegates' admiration of the wonderful results that had been reached at the recent conferences. He and his compatriots, he said, would be much honoured to receive the conference in Sweden next year, and they would look upon this meeting as an example of the things to be arranged, and would do their best to make and carry out similar arrangements.

BUSINESS ITEMS.

IN the King's Cup air race, 22 of the 23 machines completing the course were fitted with B.T.-H. magnetos.

The GENERAL ELECTRIC CO., LTD., announces that the price of the "Gecophone" portable screen grid 4-valve receiver has been reduced.

The address of the NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO., secretarial, accountants and transfer offices, has been changed to Northmet House, Cannon Hill, Southgate, London, N.14.

Messrs. G. W. WATSON AND SON, of Turl Street, Oxford, carried out electric lighting effects for the commemoration balls at Merton, University, Trinity, Brasenose, Wadham and Exeter colleges.

The CONCORDIA ELECTRIC WIRE CO., LTD., points out that the new London offices and stores at 81, Milton Street, Sydney Avenue, London, E.C.2, referred to on page 27 of our last issue, are already opened.

At the Herts Royal Agricultural Show, which took place recently, stands were occupied by the NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO., LTD., and Messrs. GIFFENS, electrical engineers, of St. Albans.

BRUCE, PEEBLES AND CO., LTD., Edinburgh, have appointed Mr. George E. Whitehead, of 102, St. Mary Street, Cardiff, as their representative for South Wales and the counties of Gloucester, Somerset, Devon and Cornwall.

The ANGLO-GALVANISING CO., LTD., Abbey House, Victoria Street, London, announces that A. LEE AND SONS, LTD., of Bessemer Road, Sheffield, have entered into an agreement for galvanising strip with the "Bianco" process of electro-galvanising.

Messrs. BASTIAN AND ALLEN, of Farnham Road, Trading Estate, Slough, announce that there may be seen at their works a "Mascarini" 300 kW 460 V 3-phase electro steam boiler, capable of producing approximately 900 lb. of steam per hour. This notice is in response to numerous applications to see this boiler in action, and arrangements have been made for demonstrations.

The MULLARD WIRELESS SERVICE CO., LTD., announces that the sales and accounts departments have been transferred from Nightingale Lane, Balham, to the company's new premises in Charing Cross Road.

The ENGLISH ELECTRIC CO., LTD., has received an order from the Maidstone Corporation for seven six-wheel, double-deck, top-covered trolley omnibuses; each vehicle will have seating accommodation for 56 passengers. The equipment will consist of an 80 H.P. motor with standard camshaft foot-operated controller. These vehicles complete will be built at the company's Preston works.

The Race Course Betting Control Board has selected "Kathanode" batteries for operating totalisators, and an order has been placed with the D.P. BATTERY CO., LTD., of Bakewell and London, for six 100 V, 500 Ah batteries, which will be mounted on lorries for transport to and from different race courses. Similar batteries are also being adapted by London and provincial omnibus proprietors for bus lighting, as the construction renders them particularly suitable for this class of work.

We are asked to announce that Mr. JAMES DUNCANSON, 29, Waterloo Street, Glasgow, C.2, has been appointed sole representative for Scotland for ALFRED GRAHAM AND CO., LTD., and the ARTIC FUSE AND ELECTRICAL MANUFACTURING CO., LTD., in succession to Messrs. John Bentley and Co., who have relinquished these agencies owing to their having taken over the Glasgow office of the now associated companies Messrs. Lawrence Scott and Electromotors, Ltd. Mr. Duncanson will continue to represent Messrs. CALDWELL AND CO., Glasgow.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

SALFORD CORPORATION.—Sub-station and pit type single-phase transformers. Specifications from the City Electrical Engineer.

STOKE-ON-TRENT CORPORATION.—Overhead wiring and services to 230 houses at Vivian Road and Warrington Street, Fenton, 28 at Marlborough Street and Evelyn Street, Fenton, and 20 at Shelton New Road, Basford. Specification from the City Electrical Engineer, Stoke-on-Trent; deposit £2.

BIRMINGHAM GUARDIANS, July 12th.—Electric light installation at the Quinton Hall Institution. Specification from the Clerk, Union Offices, Edmund Street, Birmingham; deposit £2 2s.

CARLISLE CORPORATION, July 12th.—Supply and erection of switchgear for use in 11 000 V, three-phase, 50 cycle sub-station. Specification, etc., from Mr. C. W. Salt, city electrical engineer; deposit £2 2s.

11 000 V Switchgear.

ILKLEY URBAN DISTRICT COUNCIL, July 12th.—Supply and erection of 11 000 V combined cubicle and truck type switchgear, transformer kiosk, 300 kVA and l.t. feeder gear; and 11 000 V feeder and l.t. distributors. Specifications from Mr. S. H. Fowles, Electricity Offices, Chantry Drive, Ilkley; deposit £1 1s. for each.

RIVER AVON JOINT COMMITTEE, July 15th.—Electrically-operated and controlled sluice gates at Tewkesbury. Specification, etc., from Mr. T. Hindmarsh, land drainage officer, Shire Hall, Gloucester; deposit £1 1s.

STIRLING COUNTY EDUCATION AUTHORITY, July 15th.—Electrical installation in new school at Callendar Road, Falkirk. Schedules, etc., from Mr. A. N. Malcolm, Old Burgh Buildings, King Street, Stirling, until July 15th.

BANGOR (N. IRELAND) CORPORATION, July 16th–23rd.—Ironclad and cubicle switchgear, 6 600 and 400/230 V; three-phase transformers, 200 and 100 kVA; underground cables for 6 600 and 400/230 V; and meters. Specification until July 16th from the Town Clerk; deposit £1. Tenders are invited from British manufacturers only.

HULL CORPORATION, July 16th.—Installation of electric lift at Central Public Library. Specification from the City Architect, Guildhall, Hull.

RENFREWSHIRE EDUCATION AUTHORITY, July 17th.—Electrical installation in gymnasia at Camphill Secondary School, Paisley, and gymnasium at Renfrew High School. Schedules, etc., from Mr. J. H. Pullar, County Education Offices, 16, Glasgow Road, Paisley; deposit £1.

WEST HAM GUARDIANS, July 18th.—Additional electric lighting installation in 26 wards at Whipps Cross Hospital, Leytonstone. Specifications from the clerk, Mr. L. E. Fraquet, Union Road, Leytonstone, London, E.

METROPOLITAN ASYLUMS BOARD, July 20th.—Alterations and additions to electric lighting installation at Grove Park Hospital, Lee, S.E.12. Specification, etc., from the Board's Office, Victoria Embankment, London, E.C.4; deposit £1.

CENTRAL ELECTRICITY BOARD, July 22nd.—Supply and erection of central indicators and telephones in connection with the Central Scotland Electricity Scheme. Specification (C.S.-S.S. 15) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

HINDLEY URBAN DISTRICT COUNCIL, July 23rd.—Erection of two electric motors and two centrifugal pumps at Strangeways pumping station. Specification from the Surveyor, Council Offices, Hindley; deposit £1 1s.

GAINSBOROUGH URBAN DISTRICT COUNCIL, July 24th.—Electric motors and pumps. Further particulars from Mr. S. W. Parker, waterworks engineer, Council Offices, Gainsborough; deposit £2 2s.

DOWN COUNTY REGIONAL EDUCATION COMMITTEE, July 25th.—Electric light installation in Newcastle Technical School. Specifications, etc., from Mr. Castor J. Love, 5, Wellington Street, Belfast; deposit £1 1s.

EPPING GUARDIANS, July 25th.—Electric power installation, for laundry and well at the Institution. Specification from the Clerk, Union Offices, High Street, Epping; deposit £1 1s.

CENTRAL ELECTRICITY BOARD, July 27th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Mid-East England Electricity Scheme. Specification (No. M.E.E.-P.L. 1), etc., from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, W.C.2; deposit £2 2s.

CARDIFF RURAL DISTRICT COUNCIL, July 29th.—Supply, etc., of sub-station equipment, underground cables, overhead lines, etc., in parish of Radyr. Forms of tender, etc., from Mr. R. Howard Fletcher, 3, Park Place, Cardiff.

DUNDEE CORPORATION, July 30th.—Electric light installation in connection with Fleming Trust housing scheme. Particulars from Mr. G. Baxter, 91, Commercial Street, Dundee.

MANCHESTER GUARDIANS, July 30th.—Circulating pumps and electric cable, at Crumpsall Institution. Specification from Superintendent of Works, Union Offices, All Saint's, Manchester.

NEWCASTLE ENDOWED SCHOOLS, August 24th.—Electric light installation in a new wing to be erected at each of two schools, viz.: Newcastle-under-Lyme High School, and Newcastle-under-Lyme Orme Girls' School. Specifications, etc., from Messrs. Cramp and Frith, 1, Dickinson Street, Manchester; deposit £3 3s. in respect of one contract, or £6 6s. in respect of both contracts. Tenders are invited only from firms on the National Register of Electrical Installation Contractors.

COMMITTEE OF VISITORS OF GLOUCESTERSHIRE MENTAL HOSPITALS, August 26th.—Electric wiring of Wotton and Coney Hill Mental Hospitals, on "Stannos" earthed concentric system. Specification, etc., from Messrs. Handcock and Dykes, 11, Victoria Street, Westminster, S.W.1; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

CHILEAN MINISTRY OF MARINE, July 12th.—Supply and erection of two aerial towers for new wireless station at Arica, the aerial to consist of 8 phosphor bronze cables, 200 metres in length. (Reference A.X. 8 134.)

INDIA STORE DEPARTMENT, July 12th.—Supply of three continuous wave wireless transmitting sets (580 to 3 000 metres). Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

EGYPTIAN STATE RAILWAYS, July 13th.—Supply of underground, lead-covered, paper core telephone cables (approximate value £E.25 000).

AUCKLAND ELECTRIC POWER BOARD, July 15th.—Supply of 22 000 V cable and accessories. (Reference B.X. 5 414.)

EGYPTIAN MINISTRY OF THE INTERIOR, July 15th.—Supply and erection at Mena power station of one Diesel engine driven a.c. generating set of 250 kVA. (Reference B.X. 5 331.)

VICTORIAN ELECTRICITY COMMISSION, July 15th.—Two 750 kVA transformers and spares (No. 29/42). (Reference B.X. 5 325.)

FREDERIKSBERG (DENMARK) MUNICIPALITY, July 16th.—Two 10 000 kVA transformers. (Reference B.X. 5 435.)

INDIA STORE DEPARTMENT, July 16th.—Supply of 6 500 special electric lamps for signalling purposes, etc. Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 23rd.—Telegraph instruments (schedule C. 436). (Reference B.X. 5 323.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 23rd.—Adhesive insulating tape (schedule C. 457). (Reference B.X. 5 459.)

VICTORIAN RAILWAY COMMISSION, July 24th.—Electric overhead travelling cranes, spare motors, and down shop trolley wires (contract No. 42 672). (Reference A.X. 8 092.)

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY CO., July 26th.—Supply of electric overhead travelling cranes,

Digitized by Google

etc. Forms of tender and specification (£1, not returnable) from Mr. S. G. S. Young, Secretary, 91, Petty France, Westminster, S.W.1.

MIDDLEBURG (S. AFRICA) MUNICIPALITY, July 29th.—Supply and erection of steam raising plant, steam driven alternator, condensing plant, 6 600 V transmission line and switchgear. (Reference B.X. 5 348.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th.—Water turbine driven generating sets and switchgear for Waitaki power development (section 2). (Reference B.X. 5 278.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply of h.t. and l.t. cable, lamps and sundries, in connection with extensions of the electricity undertaking. (Reference B.X. 5 312.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply and erection of steam raising plant, engine, alternator and switchgear (contract A). (Reference A.X. 7 983.)

SOUTH AFRICAN RAILWAYS AND HARBOUR, August 15th.—Electrically-driven plate bending and flattening machine (tender No. 1 498). (Reference A.X. 8 164.)

CHILEAN STATE RAILWAYS, August 16th.—Material for overhead lines, underground cable and cable boxes (Group 41); and material for lighting of locomotives and carriages (Group 43). (Reference C. 3 069*.)

CHILEAN STATE RAILWAYS, August 16th.—Telegraph and telephone materials, including copper wire and cable, switches, table telephones (Ericsson type), telephone cords, etc. (Reference C. 3 072*.)

CHILEAN STATE RAILWAYS, August 16th.—Supply of instruments of staff or tablet type, for installation at 36 stations between Alameda and Talca, locking apparatus for switches, batteries and telephone combinations. (Specification C. 3 070*.)

AUCKLAND ELECTRIC POWER BOARD, August 19th.—Single-phase transformers. (Reference B.X. 5 324.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 22nd.—Extension magneto bells, bell sets, condensers, magneto generators, central battery switchboard, tumbler switches, wall and table telephones, etc. (Reference B.X. 5 415.)

GREY ELECTRIC POWER BOARD, August 27th.—Supply and erection of generating plant, for the Arnold river hydro-electric scheme. (Reference B.X. 5 422.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, August 27th.—Supply of cord type switchboards (schedule C. 448). (Reference B.X. 5 428.)

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 7th.—Supply of v.i.r. wire. (No. P. and T. 151/1 573.) (Reference B.X. 5 416.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 10th.—Two-conductor cords (P. and T. 151/1 600). (Reference B.X. 5 462.)

LOURENCO MARQUES PORT AND RAILWAYS, September 11th.—Battery tractors and trailers. (Reference A.X. 8 172.)

BULAWAYO MUNICIPALITY, September 13th.—Supply of h.t. overhead transmission lines, stepdown transformers, pumps with motors, etc. (Reference A.X. 8 181.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply, erection and maintenance of coal conveying plant. Specification (No. 29/68) from the Agent-General, Victoria House, Strand, London, W.C.; deposit, £2 2s.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 15th.—Seven 5 500 kVA single phase auto-transformers, with accessories, for Waitaki power scheme. (Reference B.X. 5 417.)

Tenders Accepted.

OLDHAM CORPORATION.—Ferranti, Ltd., supply of two transformers.

POPLAR (LONDON) BOROUGH COUNCIL.—Siemens Bros. and Co., Ltd., supply of cables, £738.

LANCASTER CORPORATION.—Stirling Boiler Co., Ltd., installation of two water-tube boilers at electricity works, £25 765.

CHESTERFIELD CORPORATION.—English Electric Co. Ltd., transformer and switchgear, in connection with work at Whispering Well, £275.

GOVERNORS OF ROBERT GORDON'S COLLEGES.—Bell and Robertson, Ltd., electrical work in connection with erection of Gordon College Hall, £350.

CHERTSEY GUARDIANS.—Woking Electric Supply Co., Ltd., electrical installation at the Institution, Ottershaw, £525. There were 36 tenders, the highest being £1 600.

EAST HAM CORPORATION.—Enfield Cable Co., Ltd., pilot cable, £256 9s. 6d. net per 1 000 yds.; English Electric Co., Ltd., supply of two 1 000 kW convertors at Church Road sub-station, £5 499 10s.

CAPE TOWN CORPORATION.—S. A. General Electric Co., Ltd., supply of 112 flambeau brackets and fittings, £1 103 4s.; Peel Electrical and Engineering Co., Ltd., cable for Muizenberg pavilion, £334 11s. 8d. (Both recommended.)

STAFFORDSHIRE EDUCATION COMMITTEE.—W. G. France, installing electric light and power installation at New High School for Girls, Bilston, £1 033 5s. 5d., and electric light installation at Girls' High School, Stafford, £539 8s. 6d.

LEEDS.—Hackbridge Electric Construction Co., Ltd., supply of works' transformers, £2 170. Cables: W. T. Henley's Telegraph Works Co., Ltd., £2 450; Enfield Cable Works, Ltd., £3 084; Macintosh Cable Co., Ltd., £5 225; Hackbridge Cable Co., Ltd., £905 18s.; Greenwich Cable Works, Ltd., £2 743 0s. 6d.

LONDON COUNTY COUNCIL.—J. Briggs, Ltd., installation of wiring and fittings for electric lighting at new elementary school, Marvel's Lane, site No. 1, £365. Also tendered: Malcolm and Allan (London), Ltd., £369; A. Dean and Co., Ltd., £371; Stegman and Co., £375; Electrical Installations, Ltd., £386; H. J. Cash and Co., Ltd., £419.

HACKNEY (LONDON) BOROUGH COUNCIL.—Stirling Boiler Co., Ltd., three boilers, each with maximum evaporative capacity of 150 000 lb. per hour, coal handling and ash removal plant, etc., £310 679. (Recommended.) Also tendered: Babcock and Wilcox, Ltd., £312 766; Underfeed Stoker Co., Ltd., £314 729; Vickers Boiler Co., Ltd., £317 300. Herbert Morris, Ltd., 100-ton crane, with electrical equipment, and supplementary lift of 2 tons to handle smaller parts, £3 040. (Recommended.) Also tendered: Vaughan Crane Co., Ltd., £3 115; Ransomes and Rapier, Ltd., £3 595; Babcock and Wilcox, Ltd., £3 928 5s.; Stothert and Pitt, Ltd., £4 170.

THE NATIONAL REGISTER.

A Further Thirty-Seven Names Added to List of Registered Contractors.

At a meeting of the Executive Committee of the National Register of Electrical Installation Contractors on July 5th, 48 applications for registration were received from electrical installation contractors. Of this number, two applications were withdrawn and nine were declined. The names and addresses of the successful applicants are as follow:—

Hough Electric Motor Co., Ltd., 231, Drake Street, Rochdale.
Sheath, W. J., 19, Southfield Road, Edgbaston, Birmingham.
North Electrical Co. (1929), Ltd., 63B, North Street, Leeds.
Pock Azer, 16, Cross Stamford Street, Leeds.
Donkin, Norman H., 27, Hyde Park Road, Leeds.
Dickinson, Fred, 68, Hough Lane, Bramley, Leeds.
Prior, Herbert, 53, Westfield Road, Leeds.
Huggard, S., and Son, 46, Chapel Lane, Headingley, Leeds.
Ramsden, S., 19, Pleasant Terrace, Holbeck, Leeds.
Marsden, William, 45, Beverley Terrace, Dewsbury Road, Leeds.
Whitaker, John W., 26, Victoria Road, Holbeck, Leeds.
Westfield Electrical Co., 40, West Street, Leeds.
Bedford, J. E., and Son, 116-118, Harrogate Road, Chapel Allerton, Leeds.
Smith, Fred, 51, Harrogate Road, Leeds.
Phillips and Sons, 2, Wortley Road, Armley, Leeds.
Raper, Herbert 154, Holderness Road, Hull.
Pearson, George E., Nethercape Works, Farsley, Leeds.
Mohan, Edward, 5, Wilton Street, Holderness Road, Hull.
Pepper Samuel, 34, Wellington Grove, Stockport.
Contractors (Stanningley), Ltd., Bennett's Yard, Lidgett Hill, Pudsey, near Leeds.
Clark and Wilson, 15, Friars Court, Carlisle.
Thompson George (Leeds), Ltd., 35, Park Square, Leeds.
Rigby, Thomas, 136, Woodhouse Lane, Leeds.
Good Bros., 35, South John Street, Liverpool.
Mortlock, C., Ltd., 30, Station Road, Penge, London, S.E.20.
Vanstone, Charles P., 33, Daniel Street, Bathwick, Bath.
Hellaby, W. T., and Co., Ltd., 80, Dale End, Birmingham.
Pickup, Wilfred, 4, Mill Lane, Blackburn.
Ward, Harold F., 1202, Stratford Road, Hall Green, Birmingham.
Thacker, Ernest J., 67, Hamstead Road, Handsworth, Birmingham.
Brooke, John E., 24, Dragon Road, Harrogate.
Barkers Electric Service, 21, West Street, Gateshead.
Guthrie, John M., 90, Hartington Road, Stockton-on-Tees.
Central Electrical Co., York Passage, High Street, Birmingham.
Braine and Parris, 44, Seaside, Eastbourne.
Hodgetts and Le Maistre, New Town Buildings, David Place, Jersey.
Cannock Urban District Council, Electricity Department, Wolverhampton Road, Cannock, Staffs.

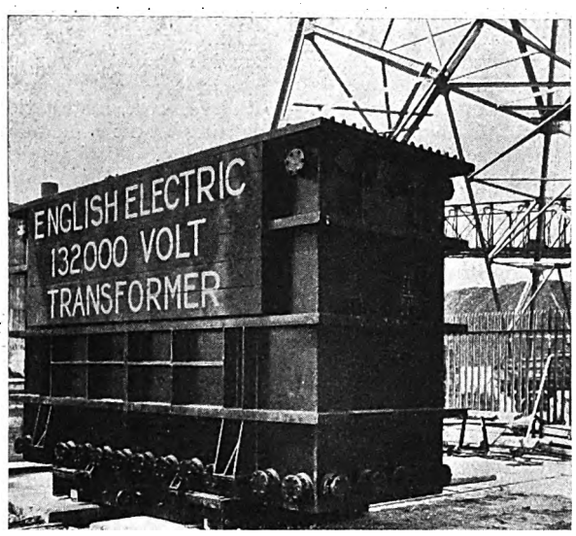
ELECTRICITY SUPPLY.

American Capital for British Undertakings—The North-East England Scheme—Report of the South-West Midlands Advisory Committee.

MR. W. M. Selvey has been asked by Torquay T.C. to report upon a scheme for the supply of electricity to ten parishes in Totnes rural district, at a fee of 50 guineas.

Electricity experts are to be invited by the Publicity Committee of Torquay T.C. to submit for consideration a scheme of coloured floodlighting for the Waldon slopes and gardens.



THE English Electric Co. has in hand for the Central Electricity Board a number of transformers for connection to 132 000 V transmission lines, and also other units for lower voltages in connection with the secondary transmission lines. The accompanying photograph shows a 15 000 kVA, 132 kV transformer which has recently been delivered to the Yoker sub-station in the Central Scotland area. The view was taken shortly after the unit was unshipped from the railway, and, of course, before the radiators, the cooling fans and the unload tap-changing gear had been fitted. Our readers who have studied the paper read before the I.E.E. by Messrs. Johnston, Wright and C. W. Marshall will recall that the Yoker sub-station adjoins the power station of the Clyde Valley Electric Power Co. on the north bank of the Clyde, and is situated immediately adjacent to one of the special towers which carry a double circuit across the river. The base of this tower, which is 270 ft. high and 60 ft. square at the ground level, can be seen in the photograph. The span across the river is 980 ft. and the tower on the south bank is 283 ft. high.

Chippenham R.D.C. will offer no objection to the proposal of the Wessex Electricity Co. to carry an overhead and underground electric line from Cirencester to Cricklade.

Mr. R. Borlase Matthews has informed Kettering R.D.C. of his intention to apply for an Order to supply electricity to practically the whole of the parishes in the northern part of the Council's area.

It is stated that Clitheroe's electrical undertaking will be extended into adjoining rural districts during the next winter. The Ministry of Transport has approved the scheme for supply to Waddington, West Bradford and Grindleton.

An agreement for the sale by Dalkeith T.C. to Lothians Electric Power Co., of the whole of the Dalkeith electricity undertaking for £30 966, was signed at a meeting of the T.C. on Monday. It was stated that the Electricity Commissioners and the purchasers had agreed to this price, as fixed by the auditor.

The chairman of the Electricity Board, Sir Andrew Duncan, and two of the prominent officials, visited Sunderland on Tuesday and conferred with Coun. Speeding, chairman of the Electricity Committee, and Mr. A. S. Blackman, the electrical engineer, respecting the proposals of the Electricity Board for the grid system in the North-East regional area.

Bristol Electricity Committee is to seek sanction to borrow £50 000 for sub-station buildings, £70 000 for sub-station plant and £80 000 for mains.—The Committee has arranged to proceed with the seventh section of the scheme for the change over of supply from single-phase alternating to the standard three-phase system, at an estimated cost of £56 277. This section embraces Bedminster, Temple Gate, St. Philip's areas, and a part of the city.

The electricity supply to Midhurst was switched on by the Midhurst and District Electricity Co. on July 3rd. Bulk supply is taken from Portsmouth Corporation by underground cable at 11 000 V, 3-phase, *via* Singleton and Cocking, villages en route, which also receive a supply. The h.t. feeder from Portsmouth, the l.t. distribution in Midhurst, Singleton and Cocking, and all transformers and switchgear, were supplied and installed by Johnson and Phillips, Ltd. The J. and P. wiring system is being largely used for the installation work.

Newbury Board of Guardians has decided to accept an offer for the supply of electricity by the Urban Electric Supply Co., when it is reported that repairs of the battery comprised in the Guardian's own installation are necessary. The running costs of the Guardians' plant are £130 per annum, and it is reported that necessary alterations to enable it to supply the new casual wards would entail an expenditure of £600, and an engineer would have to be employed at a cost of not less than £150 per annum. The company offers to supply the institution at a fixed charge of £80 per annum, plus 3d. per kWh consumed.

Bradford Corporation electricity department has opened a temporary showroom in connection with a circular which has been issued announcing that distributing mains are being extended to the Pudsey and Drighlington areas, and pointing out that the specially low rates offered are such as to render the cost of electricity quite reasonable when compared with the present cost of gas, that in many cases a change over may be effected at no increased cost, and that in some instances a reduction can be obtained. The number of domestic consumers on the Bradford supply is 20 000 and the increase is over 3 000 per annum. Some consumers, on the domestic rate, enjoy a charge as low as ¾d. per kWh. See page 64.

The South-West Midlands Advisory Joint Committee, of which Coun. Beale of Birmingham has been chairman since it was established in 1923, has just issued its annual report to the Electricity Commissioners. The district covers an area of upwards of 1 300 sq. miles. The report indicates considerable activity during the year, particularly in the hitherto undeveloped parts of Worcestershire and Warwickshire. The generating plant capacity in the area is 256 500 kW. The electricity sold shows an increase of 12¼% at 422½ million kWh. The kWh sold per head of population have increased from 191 in 1926–7 to 228 in 1927–8, and 255 in 1928–9, the number of consumers having increased during the past year by 20%.

The "Daily Telegraph" publishes a statement by the Mayor of Smethwick and the chairman of Oldbury Urban District Council, in which they refer to the recent offer of the Utilities Power and Light Corporation of Chicago, acting through the Greater London and Counties Trust, Ltd., to purchase the whole of the ordinary shares of the Shropshire, Worcestershire and Staffordshire Electric Power Co. at 50s. per £1 share. The statement proceeds: "The gravest aspect of the matter is not its repercussions in financial circles, but its effect on British trade and industry. The avowed object of the post-war Electricity Acts is to make available for the salvation of British industry and the health and welfare of the British public a cheap and abundant supply of electrical energy such as more fortunate nations already enjoy. How can that object be possible of achievement if, on the very threshold, the industry be loaded with inflated capital charges, the burden of which must inevitably fall upon the consumers of power and light and heat? If the powers and functions of the Central Electricity Board are not adequate to bring about such unification of control they could readily have been extended. If further capital was, in fact, required for genuine development of the industry the Shropshire company and the other concerns could most certainly have raised it here, without recourse to Chicago, and by methods consonant with prudent finance."

Smethwick and Oldbury Councils have passed resolutions of protest, and steps are being taken to lay representations before Parliament on this matter.

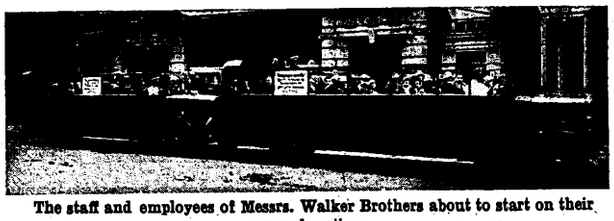
THE SOCIAL SIDE.

MESSRS. Walker Brothers, Quality House, Temple Row, Birmingham, held their sixth annual outing on June 22nd. A party of sixty employees journeyed by charabanc, via Bromsgrove, Droitwich, Worcester, Bromyard, Leominster



The staff and employees of Messrs. Walker Brothers about to start on their annual outing.

Ludlow, to Church Stretton. Lunch was taken at The Hotel, Church Stretton, after which sports were held during the afternoon in Carding Mill Valley. The return journey was made after tea via Much Wenlock and Bridgnorth.

The following are the results of matches shot during June in the Electricity Supply Rifle League, together with the draw for the next round of the knock-out competition:—

1ST DIVISION.

The Birmingham and Midland District Engineers' employees and staff of Callender's Cable and Construction Co., Ltd., journeyed from Birmingham on June 29th to London and Erith for their annual picnic, and picked athletes from the section took part in the general sports of the parent club at the playing fields of the company adjoining the Erith Works, Belvedere. They were accompanied by a large deputation of engineers from the Birmingham Electric Supply Department, for which corporation Callender's Co. acts as the mains department under contract. The Corporation party left Birmingham by special reserved carriage on the 8.40 train, and arrived at Euston 10.40, when a drive was taken around the parks and noted buildings in the West End of London, and arrived at the Erith Works at 1.15, when luncheon was served in the board's dining-room, Mr. Watson, Mr. F. Callender, Councillor Ramsden, Mr. Massey, Mr. Hill and Mr. Dodd joining the party. This is the first time at which a representative gathering from the Birmingham Section of the Callender Athletic and Social Club has attended and participated in the firm's annual sports, the occasion being taken to celebrate the commencement of the 40th anniversary of the company's operations in Birmingham.

SHOEBURYNESS SUPPLY.

Inauguration of Supply—Opening of Sunshine Home by Prince George.

PRINCE GEORGE declared the Sunshine Home, Shoeburyness, open on Monday, and, as a portion of Shoeburyness Council's electricity plant is on the premises of the Home, the chairman of the Council, Coun. Boosey, turned on the current to the town and the Home immediately before the opening ceremony. The town is supplied by means of h.t. 3-phase underground feeders from the War Department power station. After conversion by means of transformers, the l.t. supply to consumers is by means of underground, 4-wire, 3-phase distributor cables. The system is standard in every way, high pressure is 3 000 V, low pressure 400 and 230 V, and a frequency of 50 cycles. Where a branch is taken from the h.t. main an above-ground disconnecting kiosk is erected for convenience of testing and sectionalising.

At each transforming point a controller pillar is fixed, containing the h.t. supply to the transformer and the l.t. circuits coming from the transformers. On the top of each transformer, in an extension of the case, are tapping switches that can be operated under load, regulating the pressure. The chamber is fitted with three ammeters, a voltmeter, and an inspection lamp, and is to all intents and purposes a self-contained sub-station without, however, any building, covering, roof or other protection.

The two principal advantages are ready removal of the transformer in case of necessity and substitution of another, reducing cost, due to the absence of any building, and improved cooling effect of the transformer, due to there being no enclosure of the transformer windings beyond the tank containing the cooling and insulating oil.

The undertaking has commenced with about 120 consumers. Practically all the houses erected are now wired by the builders.

The new sewage system which is being installed by the Council will be driven by automatically-controlled electric motors.

The Chairman of the Electricity Committee is Coun. A. Farrow, the Council's electrical engineer is Mr. R. H. Holmes, and the consulting engineers for the scheme are Messrs. A. Hugh Seabrook and Partners. The contractors for electric cable and switchgear are the Pirelli-General Cable Works Ltd.; for transformers, the Foster Engineering Co., Ltd.; and for meters, Messrs. Chamberlain and Hookham, Ltd.

TRADE PUBLICATIONS.

WE have received from the ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, London, W.C.2, a special publication dealing with power equipment for all industries, publication No. 41B describing "Fullagar" oil engines, and publication No. 471 A, dealing with truck type switchgear. All three issues are fully illustrated.

The MULLARD WIRELESS SERVICE CO., LTD., Mullard House, Charing Cross Road, London, W.C.2, has issued a new leaflet No. W.A.22 illustrating the Mansbridge condenser, for insertion in the company's catalogue between the W.A.6 and W.A.15 leaflets. A revised leaflet No. V.T.13/1a, illustrating valve type RO/2.5 kW, has been issued in the place of No. V.T.13.

METRO-VICK SUPPLIES, Trafford Park, Manchester, have issued a new folder dealing with fans for the summer season, which is available for distribution by the trade, overprinted with contractor's name and address if desired. The cover design is symbolic of sport, and will link up with the company's series of advertisements depicting various forms of sport, which are appearing at the present time.

Messrs. ISTRUMENTI DI MISURA, "C.G.S." of Monza (Italy), have issued a well illustrated brochure dealing with the history of the works and the production of C.G.S. meters. The publication contains illustrations and descriptions of switchboard indicating instruments, moving coil volt and ammeters, single element electro-dynamic wattmeters, double-element induction type wattmeters, sector pattern volt and ammeters, edgewise pattern instruments and a wide selection of switchboard recording instruments. Particulars are also given of instrument transformers as well as details of a single-phase induction type watthour meter. The British agent for the firm is Mr. O. E. MALINVERNO, 37, Walbrook, London, E.C.4, who will be pleased either to supply copies of the brochure or give other information.

COMPANY NEWS.

Shannon Board Purchases Clones Co.'s Shares—Scottish Power Co.'s Increase of Capital—Sale of Fife Tramway, Light and Power Co.'s Undertaking—Telephone Manufacturing Co. Ceases to Compete for Unremunerative Orders—General Electric Meeting.

THE feature of the week in the electrical share market has been the commencement of dealings in the new Cable and Wireless stocks, taking the place of Marconi's and the cable telegraph securities absorbed in the big merger. Opening at about 93, the price of the 7½% "A" ordinary stock nearly touched 100, afterwards relapsing a point or two. The "B" ordinary from 70 advanced to over 95. Marconi's International Marine shares at 60s. are 2s. 6d. down. Electric Construction issues have relapsed, the ordinary 2s. 6d. to 16s. 3d., and the preference nearly 2s. to 20s. 7½d. Ever Readies and Siemens are each 1s. 3d. lower, while Henley's have lost half-a-crown. Underground Electric Railways ordinary shares have shed sixpence.

TELEGRAPH CONSTRUCTION AND MAINTENANCE CO., LTD.—Intm. div. of 6s. p. sh., tax free, will be payable on July 18.

YORKSHIRE ELECTRIC POWER CO.—Intm. div. at rate of 6% p.a., less tax, or ord. shs. for half year will be payable on August 1.

ELECTRICAL DISTRIBUTION OF YORKSHIRE, LTD.—Intm. div. at rate of 9% p.a., less tax, on ord. shs., for half-year will be payable on August 1.

CLONES ELECTRIC LIGHT AND POWER CO., LTD.—The Shannon Electric Supply Board is to purchase the shares of this co. at £1 11s. p. £1 sh.

CENTRAL STATES ELECTRIC CORPORATION.—Common stk. bonus div. of 200% will be payable to common stk. hldrs. on July 25. Stk. div. of 100% was made last April.

GREAT NORTHERN TELEGRAPH CO.'S HOLDING CO., LTD.—Directors propose to distribute for first financial year, ended June 30, total div. of 20%, to transfer £5 556 to res. and to carry fwd. £5 062.

WEST GLOUCESTERSHIRE POWER CO.—Resolutns. will be submitted at an extraord. mtg. on July 15, increasg. cap. from £600 000 to £685 000 by the creatn. of 85 000 6½% participatg. pref. shs. of £1 ea., the new shs. are to be at disposal of directors.

SCOTTISH POWER CO., LTD.—An extraord. gen. mtg. will be held on July 15, when resolutn. to increase authorised cap. from £2 500 000 to £4 000 000 will be submitted. It is proposed to create 1 500 000 new shs. of £1 ea. Resolutn. permits these shs., subject to discretn. of directors, to rank ahead of present shs. and to be issued either as pref. or ord., provided proportn. of issued pref. to issued ord. does not exceed eight to five.

PETTERS, LTD.—Net pft. for year ended March 31, 1929, after provisn. for depreciatn., etc., £32 891, plus £25 545 brt. in. Int. on fundg. certs. for year endg. July 15, 1929, £1 581; div. on pref. shs. at rate of 7% for year, £12 000; to fundg. cert. redemptn. fund, £919; div. on ord. shs. 6% for year, £5 400; to res. £10 000; fwd., £28 536. Result of year's tradg., having regard to prevailing conditns. in engineerg. industry, has bn. satisfactory.

FIFE TRAMWAY LIGHT AND POWER CO., LTD.—Directors have issued a circular to shhldrs. intimatg. that they have provisionally accepted an offer from the Scottish Power Co. to purchase undertakg. of Fife Co. for £1 025 000. Amt. is payable in cash, and purchase is to be dated as from July 1. Scottish Power Co. will provide finance necessary for the power and lighting undertakg., includg. repaymt. of advances to the Fifeshire Power Co., amtg. to £300 000. Fife Tramway Light and Power Co. owns all issued sh. and loan cap. of Fife Electric Power Co.

CABLES AND WIRELESS, LTD.—It is intimated by the co. that transfers of assented stk. and assented shs., as defined in deposit agreemt. referred to in merger plan, will not be certified by the Bank of England after July 12, 1929. This does not affect the intimatn., already published by co., that persons who still are desirous of acceptg. offer contained in plan should apply in writg. to the co. who will give them permissn. to accept (subject to such adjustmts. as may be necessary, with regard to divs,). Permissn. will be withdrawn by advertisemt. The co. also states that from correspondence received, it would seem that some of those who have not accepted the offer contained in the plan are under the impressn. that by withholdg. their assent they may obtain better terms than those contained in the plan. The co. desires to state that this assumptn. is entirely without foundatn. Amt. of ord. stk. and ord. shs. in the three cable co. and of shs. in the Marconi Co. agreed to be exchanged is in the case of each of these cos. largely in excess of the percentage necessary to make plan operative. Requisite control of the four cos. is therefore assured.

Company Meetings.

BERRY'S INSULATING AND BUILDING PRODUCTS, LTD.—Mr. A. F. Berry, presiding at the statutory meeting on June 27th, said shareholders would be interested to know that some of their best customers had recently received orders of unprecedented magnitude for electrical machinery to be used in connection with the Government's electrification scheme,

Digitized by Google

and that their company in turn had now received orders to their full capacity for their highest grade insulations—for which they had a long-established reputation—for use in important sections of this machinery. Additional plant had had to be ordered to execute this class of work, with which it would appear they would be profitably employed for the next two years or more.

The temporary showroom which has been opened by the Bradford Electricity Department in the Pudsey and Drighlington areas. See page 60.

Telephone Manufacturing Co., Ltd.—Mr. F. T. Jackson, chairman and managing director, presiding at the meeting on Monday, said: The gross profit of the British installation companies for the year shows a slight decrease, being £76 386 compared with £77 563, and net profit £37 928, compared with £41 405. As far as our British installation companies are concerned, the fact that the profits for the past year have decreased slightly is no indication of the path which will be followed in the future. The position is a strong one. Our Australian company has had a most successful 1928. The company showed a profit of £13 184, and there is every reason to anticipate that this profit will be substantially increased. The Paris and Brussels subsidiares have been entirely reorganised, and the new business being done is on a satisfactory basis. I will now deal with the accounts of the parent company. The profits for the year amount to £20 220, compared with £35 234 last year. This result is disappointing, especially when taking into consideration the fact that the turnover of manufactured goods during 1928 showed an increase of 80%, yet the total overheads on the larger output were only increased by about 1½%. Unfortunately, so far as Post Office telephone work is concerned, and which comprises by far the majority of the turnover, prices are not fixed by ourselves but by the competition. Competitors are cutting prices to such an extent that they are unremunerative. We were of opinion that the Post Office would give us support in their own interests, but that support has not been forthcoming to such a degree as would enable us to carry on without losses, consequently your directors feel that they are not justified in continuing to compete for business at prices which only cut into profits made by the installation side of the business. We have a scheme under consideration by which the subsidiary company business will be divorced from the manufacturing side. We propose to separate the factory from the installation side and thus enable shareholders to get some return on their shares. The profitable side of our business is expanding, and you can see that the profits earned last year would pay a moderate dividend of, say, 5% on the whole of our capital and carry forward a substantial sum. Reverting to our manufacturing policy, we hope that if we carry this out it will at any rate be a very definite move towards creating a more stable position and more remunerative prices in the telephone manufacturing industry. We shall not cease tendering for business at fair prices, but we shall, most definitely, cease competing at the unremunerative prices ruling to-day. If you proceed on the lines indicated in our report and my speech we should be able to pay an interim dividend in the last three months of this year.

General Electric Co., Ltd.—At the general meeting, on July 4th, Sir Hugo Hirst, chairman and managing director, said the profits for the year were some £26 000 better than last year, which was a very small increase considering the increased turnover in most of the departments. For a variety of reasons, mainly over-production in the industry and foreign importation, prices during last year had shown a tendency to drop, and it had required efforts to obtain a much greater volume of business to maintain the earning capacity of the company. The results of the year had added to the company's material strength. The number of branches and depots in the United Kingdom had been increased, to give better service to the ever-increasing number of people interested in the purchase of electrical products. The great virility with which the Electricity Board had taken up its functions under the new Electricity Act had created a new outlook on electricity supply, and whilst during the period of the creation of that authority the industry had suffered a distinct hold-up, sufficient indication had now been given as to future requirements, and the board had been able to rearrange all the company's works accordingly. At their Fraser and Chalmers works they had had to build bigger units than in the past. They had developed an overhead distribution system which had met with the approval of the Electricity Board, and had been successful in obtaining a contract—three-quarters of a million pounds—for overhead distribution for London and the South of England. They also had in hand orders for the Electricity Board for the whole of the switchgear for 130 000 V sub-stations for the Central England area. In partnership with Messrs. Pirelli, the company owned the very important Pirelli-General Cable Works at Southampton, and had received a contract for 52 miles of 132 000 V Pirelli oil-filled cable, the first installation of the kind in Great Britain, and the largest in the world. The cable industry was extremely busy, and the company shared in that demand by having obtained other important contracts, including one for 25 miles of 66 000 V cable, and another for the Municipal Council of Sydney for 60 miles. For telephone cables they had in hand not only important contracts for the British Post Office, but also for the Dominions and other overseas countries. Their Coventry telephone works, in which they produced automatic exchanges for the British and Dominion Post Offices, were also actively engaged, in conjunction with their valve works, in the wireless industry, and studies concerning the combination of radio and gramophone. Their experience with automatic telephones had led to considerable orders in connection with the installation of the totalisator on race-courses, and other studies had equipped them for entering the speaking film business from the equipment point of view. On the electric lighting side they were continuing the study of better and cheaper lighting. The Thames Embankment lighting scheme just being completed was one of the results. They had further developed their specialised factories for ebonite glass lamp caps, moulded insulation material, and others which supplied essential raw materials in their industry, and last, but not least, he desired to dwell on the progress which they were making in the domestic appliance department. It was his intention shortly to ask Mr. M. J. Railing to be a joint managing director with him. The report and statement of accounts were adopted.

New Companies.

H. J. Brooks and Co., Ltd.—Cap., £4 000. Electrical, heating and radio engineers, etc. Reg. Office: 136, Old Street, London, E.C.1.

John E. Matkin, Ltd.—Cap., £1 000. Electrical contractors, engineers and wireless dealers. Reg. Office: Co-operative Chambers Carts Lane, Leicester.

PROGRESS TRADING AND MANUFACTURING CO., LTD.—Cap., £100. Particulars same as those in Grant Baker, Ltd. (see next col.).

H. J. POOLE, LTD.—Cap., £500. To carry on agency business and that of electrical and mechanical engineers, etc. Reg. Office: Aldwych House, Aldwych, London, W.C.2.

LINLEY AND CO., LTD.—Cap., £20 000. Merchants, shippers, railway and tramway proprietors, shipowners, etc. Reg. Office: River Plate House, Finsbury Circus, London, E.C.2.

HARRIS ENGINEERING CO., LTD.—Cap., £3 000. Consulting, electrical, and general engineers, contractors, etc. A provisional director: F. M. Thompson, 5, Newstead Road, Lee, London, S.E.12.

COALISLAND AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Cap., £2 000. To carry on at Coalisland, Co. Tyrone, and elsewhere, business of an electric light and power company, etc. Reg. Office: Coalisland, Co. Tyrone.

RAPID ELECTRIC ARC WELDING AND METALS CO., LTD.—Cap., £500. To carry on business of welding metals by means of electricity, welding of steam and other boilers, furnaces, etc. Reg. Office: 60, Castle Street, Liverpool.

CHUBBS AUTOMATIC MANUFACTURING CO., LTD.—Cap., £75 000. Electricians, switchboard makers, makers of switches and motor pumps, etc. Solicitors: Wetherfield, Baines and Baines, 6, New Burlington Street, London, W.1. (Public Co.)

CHROMIUM AND GENERAL PLATERS, LTD.—Cap., £1 500. To carry on business of electro-platers and electro-depositors of metals; electrical, wireless and general engineers, etc. A first director: J. A. Peters, 30, Caldecote Street, Newport Pagnall, engineer.

"K.K." SYNDICATE, LTD.—Cap., £100. To acquire invention No. 16 360 of 1929 relating to electric storage batteries and the like, and to carry on business of electrical and general engineers and manufacturers, etc. A first director: B. Quint, engineer, of 19, Cousin Lane, London, E.C.4.

MERSEY ELECTRICS, LTD.—Cap., £3 000. To acquire business of electrical and mechanical engineers carried on by James Scott and Co., Knowsley Electrical Works, Brasenose Road, Bootle, to carry on the said business and that of boiler makers, founders, etc. Reg. Office: 64, Brasenose Road, Bootle, Lancs.

ALFRED H. HUGHES AND CO., LTD.—Cap., £1 000. Importers, exporters and manufacturers of, agents for and dealers in apparatus and accessories for wireless telegraphy, telephony, or television, or in connection with generation, accumulation, supply, distribution and employment of electricity, etc. Solicitor: M. J. Whitehead, 131, Norfolk Street, Sheffield.

GRANT BAKER, LTD.—Cap., £1 000. To acquire and turn to account patents, licenses and concessions conferring right to use information as to production, treatment, storage, application, distribution and use of electricity; to carry on business of makers of and dealers in electrical apparatus and materials, etc. Reg. Office: Kingston Bridge Works, Hampton Wick.

EDMUNDSON'S ELECTRICITY CORPORATION, LTD.

Continued Increase in Consumption—Capitalisation of Reserves—Capital Increased by Creation of 1 500 000 Ordinary Shares.

THE thirty-second ordinary general meeting of Edmundsons' Electricity Corporation, Ltd., was held on Friday, July 5th, 1929, at Broad Sanctuary Chambers, Tothill Street, Westminster, Sir James Devonshire, K.B.E. (chairman of the company), presiding. The Secretary (Mr. C. H. Jones) having read the notice convening the meeting and the report of the auditors, the Chairman said:

Gentlemen, the report of the company's business for the past year is satisfactory.

The undertakings with which the company is connected have again increased their connections by over 6 000 kW, and I am pleased to be able to state that reductions of charges for electricity were made in a number of undertakings during the year.

I have a few words to say about the report and accounts. You will see by reference to the balance sheet that the profit, with the amount brought forward from last year, is £188 660, and, compared with £149 388 for the previous year, shows an increase of £39 272, which is partly accounted for by the income tax provision in the profit and loss account being £8 931, compared with £19 234, and partly by the fact that during the year the first mortgage debenture stock, amounting to £328 077, outstanding at the beginning of the year, was redeemed, so that there was not a full year's debenture charge

After deducting the interim dividends paid last January, there is £139 660 1s. available for disposal, and we propose to make the appropriations set out in the report, namely:—£8 501 in writing off cost of increase of share capital, £25 000 to reserve, £14 000 in payment of preference share dividend, £55 000 in payment of a final dividend of 4½ % (making 8 % for the year) on the 1 000 000 ordinary shares, a half year's dividend of 4 % on the 250 000 ordinary shares issued last autumn, and £3 000 to the staff benevolent fund, leaving £34 159 1s. to be carried forward.

Preference Shareholders' Position Improved.

The ordinary share capital was increased during the year to £1 250 000. 600 000 shares were issued by way of capitalisation of reserves, in accordance with the resolution confirmed at the extraordinary general meeting on September 10th last, and 250 000 shares were issued for cash, the latter being to provide funds for the redemption of the debenture stock. The debenture stock having been redeemed, there is now no prior charge on the assets ranking in front of the preference shares, so that the preference shareholders' position has been improved.

The schedule of investments and advances which accompanies the balance sheet shows an increase of £222 975 additional shares in the Cambridge, Guernsey, Isle of Wight, Ilfracombe, Melton Mowbray, Ramsgate, Salisbury, Surbiton, Urban, Wycombe and Yeovil Companies having been taken up.

Before concluding I am sure that the shareholders would be glad that I should remind them of the most efficient and loyal work of the staff during the past year, and that the shareholders would wish to associate themselves with the directors in an expression of appreciation and thanks to the staff.

I now beg to formally move: That the report of the directors and statement of accounts for the year ended March 31st, 1929, be and are hereby adopted.

Sir Douglas Newton, K.B.E., M.P., seconded the resolution, which was then put to the meeting and carried unanimously. The retiring directors, Sir James Devonshire, K.B.E., Sir Douglas Newton, K.B.E., M.P., and Mr. A. Winterbottom, were re-elected, and Messrs. Annan, Dexter and Co. reappointed auditors. A vote of thanks was accorded to the chairman and directors.

Increase of Capital.

An extraordinary general meeting immediately followed. The Secretary read the notice convening the meeting, and the following resolution:—

"That with a view to the acquisition of not less than 90 % of the issued share capitals of the East Anglian Electric Supply Company, Limited, and the Wessex Electricity Company, and with a view also to the acquisition of investments in certain other electricity supply companies, the capital of the company be increased to £3 150 000 by the creation of a further 1 500 000 Ordinary shares of £1 each."

The Chairman said: Gentlemen, the resolution which you are asked to pass is for a substantial increase in our capital, and you may like to have some further information.

The transactions which render necessary the increase of our capital arise from the fact that the Greater London and Counties Trust, who hold the ordinary share capital in Edmundsons, have acquired a controlling interest in certain other electricity supply undertakings, and these interests they are transferring to us for the purpose of management and development.

The shares are being transferred at cost, and the whole transaction is internal between Edmundsons and the Trust, and has no other object than the closer co-ordination and management of a large number of properties of a similar nature.

The Greater London and Counties Trust have other electricity supply interests which they are not transferring to us; those to be transferred are of the type in which we have specialised and for which we have built up a system of management as the result of thirty years' experience.

Practically the whole of the interests now being transferred to us are operating in areas where we are already established, and it is expected that substantial benefits will eventually accrue from a closer amalgamation, not only to the shareholders but to the consumers of electricity.

I now beg to move the resolution set out in the notice convening the meeting.

Sir Douglas Newton, K.B.E., M.P., having seconded the resolution, it was then put to the meeting and carried unanimously.

The proceedings then terminated.

E

Deeds of Arrangement.

BARON, Frederick, Edgar Street and 33, Beach Street, Accrington electrical engineer. Dated June 28th, filed July 3rd. Trustee, J. D. Hopkinson, Market Chambers, Blackburn Road, Accrington, C.A. Secured creditors, £350; liabilities unsecured, £519; assets, less secured claims, £159.

GILPIN, Mrs. Madge (widow), trading as GEO. GILPIN AND SON, 6A, Alfred Street, Blackpool, electrician. Dated July 1st, filed July 5th. Trustee, J. Todd, 18, Birley Street, Blackpool, C.A. and another. Liabilities unsecured, £281; assets, less secured claims, £225.

WALSH, Patrick William, trading as WALSH AND DOUGLAS, 26, Spring Hill, Birmingham, electrical engineer and wireless dealer. Dated July 1st, filed July 4th. Trustee, W. W. Freeman, 3, Cherry Street, Birmingham, certified accountant. Liabilities unsecured, £458; assets, less secured claims, £42.

WHITE, Arthur Ernest, late trading as REDCLIFFE WIRELESS CO., 76, Redcliffe Street, Bristol, and now residing at 52, Monk Road, Bishopston, wireless dealer. Dated June 27th, filed July 3rd. Trustee, A. J. Rawlings, 51, Quantock Road, Bedminster, cashier. Liabilities unsecured, £280; assets, less secured claims, £59.

Receivership.

CUNNINGHAM SLATER, LTD. (formerly HARRAWAY BROS., LTD.). W. Nicholson, of 12, Wood Street, E.C., was appointed receiver on June 24th, 1929, under powers contained in debentures issued January 15th, February 3rd, and March 10th, 1914.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

ATHERTON, Walter E., trading as ATHERTON AND HALL Claremont Works, General Street, Blackpool, radio engineer. A meeting of the creditors of the above was held on July 4th, at Blackpool, when the representative of Messrs. Ellis and Mort, Ltd., was elected to the chair. The statement of affairs showed liabilities of £754, all due to unsecured creditors. There was a fully secured creditor for £3, holding security valued at £50. After allowing £88 for preferential claim the net assets were £329, or a deficiency of £425. The assets consisted of cash at bank £4; stock at cost £228, estimated to realise £114; fixtures, fitting, etc., £8; life policy, £12 10s.; motor car, £12; book debts, £315, valued at £220; and surplus from fully secured creditors, £47. In addition to the liabilities shown on the statement the debtor's wife was a creditor for £189. The secured creditor was the Marconi Co., who held a deposit of £50 against royalties. The meeting had been called as three creditors had commenced proceedings. The debtor commenced trading in 1923, in partnership, the joint capital being £315. The debtor's share of the capital was borrowed from his wife. The partnership was dissolved last November, when it was agreed that the debtor should continue the business, and the outgoing partner took over the charging plant. The dissolution was duly "Gazetted." The present position was attributed to lack of capital, and a fall in the turnover.

A resolution was passed in favour of a deed of assignment being executed.

The following are creditors: Bell, J. R., Blackpool, £42; Firth and Price, Blackpool, £36; Ellis and Mort, Ltd., Blackpool, £280; Hollingdrake, Henry and Son, Ltd., Stockport, £171; Kremner, L., Manchester, £37; Docking, J. W., Blackpool, £12; Rothermel Radio Corporation, London, £69; Stephenson Bros., Blackpool, £44.

ENTERPRISE MANUFACTURING CO., LTD., wholesale electrical and wireless suppliers, Electric House, 83, 85 and 87, Merton Road, Wimbledon, London, S.W.19. In response to a circular letter issued by the company, a conference of the principal creditors, was held on July 3rd at Johnston's Rooms, 13, The Broadway, Wimbledon. Mr. Leask, of Messrs. Leask, Clemens and Co., C.A., the company's auditors, occupied the chair. It was stated that at the end of May the liabilities of the company inclusive of a debenture were £9 378, against assets of £9 432, and the company was solvent. The company was registered in July 1917 with a nominal capital of £5 000, divided into shares of the face value of £1 each, and it acquired a business which up to that date had been carried on at Gun Street, Bishopsgate. The assets acquired by the company were valued at £3 000, and shares to that amount were issued as fully paid to the vendor. Later the business was transferred to Grape Street, Holborn, and later to its present address. It was pointed out that the removal took place in order to reduce the overhead expenses, and there had been a saving of something like £2 000 effected since September of last year. The company had suffered through burglaries at Grape Street and Wimbledon. The company was insured, but, in the absence of detailed stock sheets, it was not possible to prove the full extent of the loss. The issued capital of the company stood at £4 452 and a number of shares had been issued for cash. The debenture was issued in favour of the bank in the early part of the present year. During the last six months of 1923, there was a loss on trading of £107, but in the following half year there was a net profit of £577. The company was able to trade successfully up to June 1926, profits being regularly earned, but during the 12 months to June 1927 there was a loss of £1 165. During the period from June 1927 to September 1928 there was a small profit earned, but since the latter date there had been a net loss of £200. The heavy loss during the year to June 1927 was accounted for by the fact that at that time the company was occupying premises at Grape Street, where the overhead expenses were very heavy, having regard to the turnover. The last balance sheet was dated March 31st, 1929, and it disclosed liabilities of £8 991, and the debenture of £2 000. The assets, however, were substantial and included book debts estimated to realise £5 453, stock £3 852, furniture and fittings £504, motor cars, etc., £808, goodwill £1 631, and amounts paid in advance £550. The company had a substantial turnover, and was able to earn a satisfactory rate of gross profit.

In the course of the discussion, it was stated that the bank were sympathetic, and it was suggested that the creditors should accept a composition of 10s. in the £, payable by four instalments of 2s. 6d. each, over a period of 12 months. It was pointed out that what the company really required was a moratorium. It was understood that the bank would assist the company further, provided the creditors agreed to a moratorium, and to accept the offer.

A resolution was unanimously passed agreeing to accept the company's proposals, and an informal committee was appointed consisting of the representatives of Messrs. Mullard Wireless Co., the Ever-Ready Co. (Great Britain), Ltd., E. M. I., Ltd., Siemens Electric Lamps and Supplies, Ltd., and Marconiphone Co., Ltd.

London Gazette, etc.

Company Winding-up.

EARLSDOWN RADIO SUPPLIES, LTD. Meetings of creditors, July 20th, 11 a.m.; and contributories, July 20th, 11.30 a.m., Official Receiver's Offices, 22, Regent Street, Park Row, Nottingham.

Companies Winding-up Voluntarily.

CHARTERS ELECTRIC SUPPLIES CO., LTD. By reason of its liabilities, June 25th. J. L. Watchurst, chartered accountant, Market Gate Chambers, Warrington, appointed as liquidator.

SAUNDERS ELECTRICAL CO., LTD. By reason of its liabilities, June 28th. R. B. Leech, 23, Warwick Row, Coventry, Chartered Accountant, appointed as liquidator for the purposes of such winding-up. Meeting of creditors at the offices of the liquidator, July 18th, at 12 noon.

Bankruptcy Information.

AUSTIN, Clifford, 97, Domestic Street, Leeds, trading as C. AUSTIN AND SON, and "AUSTINS ACCUMULATOR AND RADIO SERVICE," wireless accessories dealer. First meeting, July 15th, 11 a.m., Official Receiver's Office, 24, Lower Bond Street, Leeds. Public examination, August 13th, 10.30 a.m., County Court House, Albion Place, Leeds.

STRATHDEE, Andrew Knox Ewart, 923, Romford Road, Manor Park, trading as EMSCO RADIO, electrical engineer. Receiving order, July 6th. Debtor's petition. First meeting,

Digitized by Google

July 18th, 11.30 a.m., and public examination, August 13th, 11 a.m., Bankruptcy Buildings, Carey Street, London W.C.2.

TEMPEST, Colonel, 4, Manns Court, Bradford, electrician, Receiving order, July 3rd. Debtor's petition.

Notice of Intended Dividend.

HYDE, Hubert Algernon, 148, Weston Park, Crouch End, North London, lately 2, East Street, Bromley, Kent, wireless dealer. Last day for receiving proofs, July 20th. Trustee, T. Gourlay 29, Russell Square, W.C.1.

Partnerships Dissolved.

READ BROS. (Joseph Henry READ and Harold BOLTON). electrical engineers, 100 and 240A, High Street, Erdington, Birmingham, by mutual consent as from April 15th, 1929. Debts received and paid by J. H. Read.

WHITFIELD AND GALT (William WHITFIELD and John Anderson GALT), dynamo and magneto repairers, Douglas Street, Glasgow, June 30th, 1929, by the retiral of John Anderson Galt. W. Whitfield has acquired the assets of the firm, and will discharge its liabilities.

Bankruptcy Proceedings.

HENDERSON, John Arthur, trading as HENDERSONS, electrical contractor, 28A, Basinghall Street, London, E.C. A sitting for the public examination of the debtor was held in the London Bankruptcy Court on Friday of last week before Mr. Registrar Warmington. The statement of his affairs discloses liabilities £4,501, of which £3,834 are returned as expected to rank for dividend, and net assets £243. It appeared that for some years before 1914 the debtor carried on business as an electrical contractor at his private address. Afterwards he acted as managing director of a limited company at a remuneration of £4 a week until 1925. In that year with a borrowed capital of £100 he resumed business as an electrical contractor, and he traded under the style of "Hendersons," at 2, Little Essex Street, Strand, W.C., until last October. In that month he removed to 28A, Basinghall Street, City. During the past two years, however, the business had not been a success, and eventually in consequence of pressure by creditors he filed his petition. The debtor attributed his insolvency to bad trade and to lack of capital.

The examination was concluded.

The following are creditors: Alliance Wholesale Electrical Co., London, £168; British Insulated and Helsby Cables, Prescot, £44; Bennett and Fountain, London, £58; Bisseker, H., Ltd., Birmingham, £85; Ball, S., London, £120; Battley, J., London, £50; Bell, A., London, £30; Barclays Bank, London, £330; Crossley Bros., London, £26; Cameron, J., London, £35; Edwards, J., London, £66; Ovens, D. C., and Co., London, £62; General Electric Co., London, £67; Garrett and Son, J., London, £88; Greenwood, B., London, £50; General Cable Manufacturing Co., Ltd., Leatherhead, £250; Heys and Co., Wigan, £48; Henley's Telegraph Works, London, £155; Highgate Cable and Engineering Co., Ltd., London, £16; Holborn Electric Co., London, £10; Higgs, F. and H. F., Herne Hill, £556; James, H., jun., Mansfield, £30; Laws, W., London, £50; Lightfoot, J., Ltd., Manchester, £81; Mackintosh Cable Co., Derby, £20; Peckham, G., and Co., London, £18; Rowell, J. B., London, £25; Sanders and Co., Wednesbury, £132; Surrey Engineering Co., London, £50; Tate, S., London, £101; Truslove and Co., London, £88; Wright, J., Ashtead, £701; Walsall Hardware Co., Walsall, £82; Z Electric Lamps, London, £76.

∴ The metal prices are supplied by British Insulated Cables Ltd.

THE LEAD MARKET.

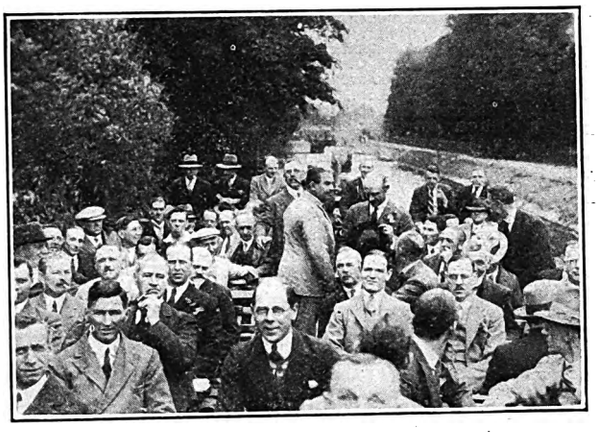
The lead market opened steadier last week and, according to James Forster and Co., values were 1s. 3d. per ton higher all round. Prices later gave way 5s. a ton, followed by a fall of 7s. 6d. Closing prices on July 5th were £22 16s. 3d. for all positions, showing a fall of about 10s. per ton on the week.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

PATHFINDER.—498 136. Class 8. Wireless telephonic apparatus. Essex Radio Supplies, Ltd., 35, Norton Folgate, London, E.1; wireless factors. December 15th, 1928.

ELECTRACHORD.—501 380. Class 8. Talking machines. The Duophone and Unbreakable Record Co., Ltd., 6, Martin Lane, Cannon Street, London, E.C.4; manufacturers. March 28th, 1929.



G.E.C. travellers afloat on the s.s. "Grand Duchess" on their annual river trip to Reading.

SOLINK.—500 322. Class 13. Electric lighting fittings, junction boxes, fusible cut-outs, switches and circuit breakers, all being metal goods. Donovan and Co., Safuse Works, Northcote Road, Stechford, Birmingham; manufacturing electrical engineers. February 23rd, 1929.

VIGILUS (SIGN).—494 440. Class 8. Wireless telephonic apparatus and recording instruments. The Thompson Manufacturing Co., Ltd., Water Lane Works, Water Lane, Richmond, Surrey; scientific and electrical instrument makers. August 24th, 1928.

"EMITTA."—499 224. Class 8. Electrical accumulators. William Henry Holbird, 9, Blenheim Grove, Rye Lane, London, S.E.15; electrical manufacturer and factor. January 21st, 1929. User claimed from September, 1925.

VOLUVERNIA.—501 933. Class 8. Philosophical instruments and apparatus. Gambrell Brothers, Ltd., Merton Road, Southfields, London, S.W.18; manufacturers. April 18th, 1929.

MIC.—479 196. Class 8. Components of telegraph, telephone and radio apparatus. Micanite and Insulators Co., Ltd., Empire Works, Blackhorse Lane, Walthamstow, London, E.17; manufacturers. March 26th, 1927. To be associated with No. 420 136 (2 292) l.

TOBIS.—497 628. Class 8. Apparatus for use in connection with talking films, wireless telegraphy and telephony, talking machines and sound records and cinematograph films prepared for exhibition. Tonbild-Syndikat Aktien-Gesell, Jägerstrasse 6, Berlin, W.8, Germany; manufacturers. November 30th, 1928.

"SI-MEN-SEH" (Chinese lettering).—498 402. Class 50. Electrical insulating substances and materials. Siemens and Halske Aktien-Gesell., 101 to 110, Nonnendamm-Allee, Berlin-Siemensstadt, Germany; manufacturers. December 21st, 1928. To be associated with Nos. 475 014 (2 564), 475 521 (2 565) and others.

Opposition to the registration of the following trade marks can be lodged up to July 26th, 1929.

TONBYS.—499 543. Class 8. Apparatus for use in connection with talking films; wireless telegraphy and telephony; talking machines and sound records; and cinematograph films. Tonbild-Syndikat Atkien-Gesell., Jägerstrasse 6, Berlin, W.8, Germany; manufacturers. January 30th, 1929. To be associated with No. 497 628 (2 673).

CELEBRO.—499 818. Class 8. Wireless telephonic instruments and gramophones. Celebritone, Ltd., Commerce House, 72, Oxford Street, London, W.1; manufacturers. February 7th, 1929. To be associated with No. 491 264 (2 626).

SILVER-CHIMES.—501 556. Class 8. Wireless telephonic receiving apparatus. Louis Kremner, 49A, Shudehill, Manchester; manufacturer and merchant. April 6th, 1929.

VICTONELLA.—502 631. Class 8. Wireless telephonic apparatus and gramophones. J. J. Vickers and Sons, Ltd., 70, Royal Hill, Greenwich, London, S.E.10; manufacturers. May 9th, 1929. To be associated with No. 502 632 (2 674) ix.

VOLUSTAT.—502 709. Class 8. Electrical resistances. Harlie Brothers, 3, Balham Road, Lower Edmonton, London, N.9; manufacturers and merchants. May 11th, 1929.

NERON-VITALUX.—501 749. Class 13. Electric lamps. Osram Gesellschaft mit Beschrankter Haftung Kommandit-Gesellschaft, Ehrenbergstrasse 11 to 14, Berlin, O.17, Germany; manufacturers. April 12th, 1929. To be associated with Nos. 457 992 (2 466) and 469 922 (2 522).

SUNBEAM.—479 619. Class 8. Fitted electric switchboards and induction coils for ignition purposes and batteries, all being parts of motor cars and other motor vehicles (except motor cycles and side cars). The Sunbeam Motor Car Co., Ltd., Moorfield Works, Upper Villiers Street, Wolverhampton; manufacturers. October 5th, 1926. To be associated with No. 484 295 (2 665) vi. and another.

FLEXSTONE.—501 961. Class 8. Cells for electric batteries. J. Stone and Co., Ltd., Brass, Copper and Iron Works, Abinger Road, Deptford, London, S.E.14; engineers. April 19th, 1929. To be associated with No. 501 962 (2 675) xl.

DYSONIA.—501 601. Class 8. Philosophical and scientific instruments. Hardyson Radio, Ltd., 13, Market Street, Huddersfield; manufacturers. April 9th, 1929. To be associated with No. 501 602 (2 675) ix. (By consent.)

MAGNAGRAM.—502 494. Class 8. Radio receiving sets; and radio receiving sets in combination with gramophones. Burne-Jones and Co., Ltd., 296, Borough High Street, London, S.E.1; radio manufacturing engineers. May 6th, 1929.

SUNBEAM.—473 620. Class 13. Electric switches, lamps, horns and sparking plugs, all being parts of motor cars and other motor vehicles (except motor cycles and side cars). The Sunbeam Motor Car Co., Ltd., Moorfield Works, Upper Villiers Street, Wolverhampton; manufacturers. October 5th, 1926. To be associated with No. 484 295 (2 665) vi. and another.

LYRIC.—500 550. Class 13. Electric lamps (ordinary), switches (ordinary), fuses, contacts and terminals, fusible cut-outs and lighting fittings, all being goods or ordinary metal. Max Weinbaum, 419 to 423, Commercial Road, London, E.1; merchant. March 1st, 1929. To be associated with No. 500 551 (2 675) xv. and another.

UNIFLEX.—502 065. Class 50. Electrical insulating materials composed principally of mica and sold in sheet or tape form. The Sterling Varnish Co., Fraser Road, Trafford Park, Manchester; and Hayesville, near Pittsburg; manufacturers. April 23rd, 1929.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

311 196 S. Sokal (Kalle and Co., A.-G.). Manufacture of light-sensitive materials. (7/1/28.)
311 351 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Voltage-regulating means. (9/1/28.)
311 352 P. H. Hull and Imperial Chemical Industries, Ltd. Process and apparatus for effecting chemical reactions in gases by means of electrical discharges. (10/1/28.)
311 199 F. Berg. Drumstick fastening for suspension insulators. (30/1/28.)
284 706 Siemens and Halske A.-G. Thermionic valve circuits. (5/2/27.)
287 544 Allis-Chalmers Manufacturing Co. Electric switchgear. (24/3/27.)
311 201 English Electric Co., Ltd., and C. J. Chaldbeck. Power generation and transmission systems. (2/2/28.)
311 253 United Water Softeners, Ltd., and E. B. Higgins. Electrolytic production of sterilizing-agents, germicides, and the like, and processes of applying such agents. (6/2/28.)
311 254 S. G. S. Dicker. (N. V. Philips' Gloeilampenfabrieken). Electric rectifiers. (6/2/28.)
311 303 W. Haddon and J. M. Burnett. Electrical accumulators. (6/2/28.)
311 356 F. Oliver. Wireless receiving apparatus. (7/2/28.)
311 209 W. Rogers and Wingrove and Rogers, Ltd. Variable condensers. (7/2/28.)
311 214 H. C. Hodges. Apparatus for charging and discharging electric storage batteries. (7/2/28.)
285 901 Siemens-Schuckertwerke Akt.-Ges. Charging stations for storage batteries. (25/2/27.)
311 262 W. A. Coates, and Associated Electrical Industries, Ltd. Electrical ontrol switchboards. (8/2/28.)
311 305 L. G. H. Cantle. Electric reproduction of sound. (8/2/28.)
311 307 General Electric Co., Ltd., and C. C. Garrard. Apparatus for indicating electrically the value of a quantity at a remote point. (9/2/28.)
285 045 E. W. Buquet. Mounting of lamps. (9/2/27.)
311 309 Associated Telephone and Telegraph Co., and A. E. Hudd. Train-control systems. (9/2/28.)
285 048 Soc. Belge Radio-Electrique. Adjustment devices suitable for use with variable electric condensers. (9/2/27.)
285 089 M. Surjaninoff. Arrangements for generating a progressive movement of a body susceptible of being subjected to the influence of electromagnetic fields. (11/2/27.)
311 445 Associated Electric Industries, Ltd. (Westinghouse Electric and Manufacturing Co.). Electrical control systems for elevators, hoists, and the like. (11/2/28.)
290 239 Electrical Research Products, Inc. Acoustic devices such as loud-speakers. (11/5/27.)
311 449 C. S. Franklin. Aerial systems. (11/2/28.)
311 450 S. Richardson. Employment of wireless apparatus. (11/2/28.)
311 451 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). High-frequency signalling over wires. (11/2/28.)
311 452 C. R. Cook. Electric couplings, terminals, and the like. (11/2/28.)
311 460 Automatic Telephone Manufacturing Co., Ltd., W. H. Paulett, and C. Gillings. Telephone systems. (13/2/28.)
311 464 W. L. Spence. Electromagnetic brakes. (16/2/28.)
311 466 W. S. Smith and N. W. McLachlan. Audio-frequency thermionic amplifiers. (16/2/28.)
311 469 British Thomson-Houston Co., Ltd., and W. H. Lawes. Electric relays and like electroresponsive devices for use, for example, in electric protective systems. (17/2/28.)
311 476 G. W. Parr. Electromagnetic-drive units for loud-speakers and the like. (20/2/28.)
311 485 N. Bonavia-Hunt. Wireless receiving apparatus. (27/2/28.)
311 486 British Thomson-Houston Co., Ltd., and R. D. Parry. Electromagnetic acoustic devices for the interconversion of mechanical and electric oscillations, such as loud-speakers. (27/2/28.)
286 202 Felten and Guilleaume Carlswerk Akt.-Ges. Manufacture of magnet cores for pupin coils and the like. (26/2/27.)
311 502 Drysdale and Co., Ltd., and W. Drysdale. Electric-motor-driven centrifugal pumping units. (15/3/28.)
287 927 British Thomson-Houston Co., Ltd. Systems for producing high-frequency electric oscillations. (30/3/27.)
288 313 A.C. Spark Plug Co. Temperature compensators for use in magnetic measuring instruments. (8/4/27.)
311 524 E. H. Sumner. Wireless receiving apparatus of the crystal type. (12/4/28.)
311 526 H. P. Hinton, and Associated Electrical Industries, Ltd. Wireless receiving apparatus. (13/4/28.)
311 528 Edison Swan Electric Co., Ltd., and F. Shergold. Electric switches. (17/4/28.)
311 552 H. O. Hill, and Riter-Conley Co. Transmission towers. (9/5/28.)
311 558 H. R. G. Moore, and L. C. B. Johnson. Electric relays and contact makers. (16/5/28.)
293 851 R. Bosch Akt.-Ges. Electrical ignition system for internal combustion engines. (14/7/27.)
311 569 W. H. Crawford. Electrically-heated dispensing pumps. (31/5/28.)
311 572 G. Marr. Electric switches. (6/6/28.)
311 574 British Thomson-Houston Co., Ltd., and R. Dumas. Transformer radiators. (7/6/28.)
292 075 Akt.-Ges. Brown, Boveri et Cie. Mercury-vapour rectifier. (11/6/27.)
311 579 General Electric Co., Ltd., and E. L. Randall. Multi-lamp electric lighting apparatus. (16/6/28.)
293 039 International General Electric Co., Inc. Manufacture of commutators. (30/6/27.)
304 583 F. Pavlan. Variable electric condensers. (21/1/28.)
311 605 A. E. White (Indian Motocycle Co.). Electrical generating and distributing systems for internal-combustion engines. (30/7/28.)
294 966 J. Gize. Alternating current induction motors. (2/8/27.)
297 109 Maschinenfabrik Oerlikon. Turbo-generator plant employing st eam as motive power and hydrogen gas as cooling-medium. (15/9/27.)
299 013 International General Electric Co., Inc. Means for reducing the eddy current losses in the windings of alternating current machines. (19/10/27.)

Applications for Patents.

April 22nd.

12 477 R. Annan. Variable resistances.
12 437 British Thomson-Houston Co., Ltd. Apparatus for producing sound. (21/4/28, U.S.)
12 378 J. Davis and Son (Derby), Ltd., and W. Grafton. Miners' electric lamps.
12 467 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken).—Transmitting images.
12 468 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Thermionic valve arrangements.
12 469 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Push-pull thermionic amplifiers.
12 470 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Electric lamps.
12 438 Edison Swan Electric Co., Ltd. Coin-freed apparatus.
12 457 E. V. G. Electro-Vertriebs-Ges. and Emmrich and Co. Hand and face drying device. (12/11/28, Germany.)
12 483 B. Houri. Electrical reproduction of sound.
12 401 G. T. Hunt. Providing rubber-tyred vehicles with electrical earthing system.
12 374 J. W. Riddiough and E. H. Roberts. Combined wireless and gramophone sets, etc.
12 471 Sangamo Electric Co. Induction motors. (14/5/28, U.S.)
12 501 Staat der Nederlanden. Telephone systems. (23/11/28, Germany.)
12 390 A. M. Taylor. Electric power transmission.
12 489 H. Wade (Moffats, Ltd.). Electric heating elements.
12 476 Western Electric Co., Ltd. (Bell Telephone Laboratories, Inc.). Submarine communication conductors.
12 508 D. Y. Wheatley. Impulse starters for magnetos.
12 425 F. G. Wood. Polarised light apparatus.

April 23rd.

12 588 Ateliers des Constructions Electrique» de Charleroi. Starting polyphase motors. (30/8/28, Belgium.)
12 626 S. von Bogdandy and L. Wamascher. Vacuum, etc., metallic vapour lamps. (14/5/28, Germany.)
12 573 British Insulated Cables Ltd., and H. H. Lord. Electric cables.
12 586 British Insulated Cables Ltd. Testing incandescent lamps, etc. (23/4/28, U.S.)
12 559 D. Dunnett. Electrically operated signals on motor cars.
12 551 G. Foggo. Generating power.
12 548 A. R. Evans. Charging systems for secondary batteries.
12 619 T. Hard (Telefonaktiebolaget L. M. Ericsson). Electric control of railway signals.
12 520 A. Marr. Telephones, gramophones, etc.
12 547 A. Marr. Cones for telephone transmitters.
12 629 J. Mehl. Flux-coated electrodes for electric welding. (23/4/28, Germany.)
12 616 N. V. Philips' Gloeilampenfabrieken. Sockets for electric lamps. (23/5/28, Holland.)
12 623 A. J. Stephens (Excelsiorwerk Metallwarenfabrik A.-G.). Electric motors.
12 592 R. Viesi. Electric balance for automatic transformation of alternate current.
12 658 H. Wade (Bakelite Corporation). Insulating materials.
12 610 A. E. White (Own Dyneto Corporation). Voltage regulators for electrical machines).
12 521 O. C. Wilder. Thermionic valve holder.

April 24th.

12 793 American Electric Co., Inc. Portable measuring sets for transmission lines, etc. (2/7/28, U.S.)

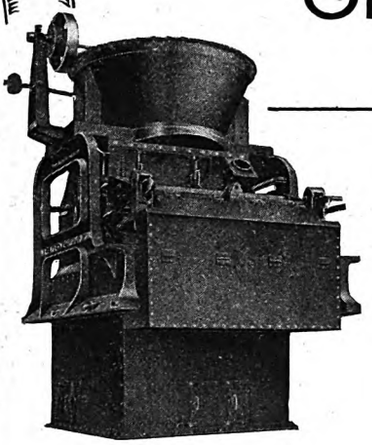
AVERY

ECONOMY IS BORN OF KNOWLEDGE.



AVERY PATENT
AUTOMATIC WEIGHER
FOR PULVERISED FUEL
LIST 1177.

The Avery No. 52 Automatic Weigher for Pulverised Fuel gives without dust escape, correct records of fuel consumption. The machine illustrated weighs 50 tons per hour from an Overhead Storage Hopper, and delivers to the pump. Thus, accurate records of fuel consumption are automatically kept, losses are instantly detected and economy achieved.

The Specialists in handling, weighing and blending machinery. Complete plants supplied.

Telephony with Australia.

It is interesting to note that the re-broadcasting of the Westminster Abbey Thanksgiving Service throughout Canada by means of the new Marconi-Mathieu multiplex apparatus which enables telephone and telegraph services to be conducted simultaneously over a single "beam" circuit, was so good that the service was passed on to Australia over the Canada-Australia beam and was successfully re-broadcast in Australia. This in itself is no mean achievement, but on the same day two-way telephony was conducted between an engineer at Bridgwater, Somerset, and an engineer at Rochbank, near Melbourne, in such a way that results were as good as those associated with inland telephony. The distance between the speakers was approximately 13 000 miles, and the route was via the England-Canada and Canada-Australia beam services, using similar apparatus to that employed for relaying the Thanksgiving Service. A conclusion which may be drawn from this experiment is that if Marconi-Mathieu equipment were installed in Australia, similar conversation could be carried on direct without the intervention of the Canadian stations, and the circuit would become a normal method of telephonic communication with Australia open for public use. The establishment of such a service, which has been under consideration for some time, is a subject for arrangement between the Home and Commonwealth Governments and the wireless companies concerned. One would have thought that such an event, unique in the history of telephonic and telegraphic communication, would have been the subject of considerable publicity in the newspapers of this country, but so modest are we in these matters that even the lesser achievement of relaying the Thanksgiving Service to Canada resulted in many letters of congratulation being sent to the National Broadcasting Company—of America! Unless we are very careful, and unless we change our methods of showmanship, the credit for the "beam" system, the establishment of world-wide communication by radio telegraphy and telephony, the invention of the radio valve itself will soon be handed over to America. In much the same way that our claim to the invention of the electric lamp has been, to say the least, eclipsed by American publicity concerning the later design of Edison, so will our achievements in radio communication assume an American atmosphere until in time they may perhaps be presumed to be American in origin.

A Mistaken Policy.

In these days when advertising plays so great a part in the success or otherwise of commercial undertakings, modesty is out of place. Since the war Great Britain has been challenged in many of the world markets, and in some places where once we held a monopoly we now find it hard to retain our position. America's greatest slogan is "tell the world," and she does not hesitate to apply her own advice to whatever piece of showmanship she may be able to stage. We, on the other hand, with our natural dislike of self-advertisement, make secrets of our successes, in the belief that to shout them from the house tops is bad form. It may be conceded that there is something fine about our national reticence, but when that reticence means that others get both the glory and the business it is time for us to abandon our policy of modest silence and go in for a little trumpet-blowing.

Ultra-Violet Radiation in the Rubber Industry.

The use of ultra-violet radiation has now become a definite part of manufacturing technique in the rubber industry. Because of its wide adaptability, the quartz mercury vapour lamp is the instrument most used, and the method is divided into two main applications. Of primary importance is the identification of materials by the characteristic fluorescence which many substances exhibit when excited by ultra-violet radiation; while the application of the rapid photo-chemical reactions induced by exposure to this source of light is a development in which considerable progress has been made. Some work has also been done on the identification of materials, advantage being taken of the fact that many mineral substances continue to exhibit fluorescences of characteristic colour when mixed with rubber, both in the vulcanised and the unvulcanised state. Materials such as zinc-oxide can often be classified according to source of supply by examination under the mercury vapour lamp, and the presence or absence of a large number of powders and drugs in rubber mixers can be detected by this means. The photo-chemical reactions induced by exposure to ultra-violet light include fading of organic dyestuffs, darkening of certain white pigments and the rapid oxidation of rubber itself, which is often revealed by the appearance of large numbers of minute

Digitized by Google

cracks on the surface of the sample. The colour-stability to sunlight of dyestuffs used in the proofing trade is another matter of considerable technical importance, and the apparatus known as the fadeometer, which consists essentially of a mercury vapour lamp, is in common use. In the same way, exposure tests are carried out to determine the resistance to sun darkening of white rubber loaded with such pigments as lithopone. Resistance to sun-cracking is a matter of much importance in the tyre industry, and accelerated ageing tests involving the use of the mercury vapour lamp are carried out in the laboratory to determine the relative values of various rubber compounds as far as this particular property is concerned. Originally, ultra-violet radiation was used solely in minor laboratory work, but it has now become a part of the working processes of the industry. Amongst users, the Dunlop Rubber Co. have two mercury vapour lamps at Fort Dunlop, and similar apparatus has been installed by all their subsidiary companies and is being used for one or other of the purposes indicated, while most of the large tyre manufacturing companies employ similar methods.

Worth Copying.

An innovation which should appeal to other technical bodies was made at the last meeting of the Electroplaters' and Depositors' Technical Society. This took the form of a general discussion on subjects chosen by the members themselves, and assumed the form of questions and answers. The meetings of scientific bodies are as a rule convened to hear papers which have been selected by their councils, with often only a vague reference to subjects on which the members themselves seek information, or would like to discuss. There are, of course, occasions when symposia are held by societies on some broad general subject, but the opportunity afforded to members of raising any subject they like, and informally discussing it amongst themselves is, we believe, quite novel, and differs entirely from the questions asked on a definite paper in the ensuing discussion, which, if not strictly relevant, would, of course, be out of order. That the discussion in question was chiefly confined to matters relating to nickel plating in no way affects the principle involved, namely, that any kind of question could have been asked. An "open night" of this kind would, we feel sure, be popular with the members of most societies, who would welcome opportunities of meeting together to exchange views on subjects of immediate interest to them, as distinct from some one specific subject which may appeal to a few only of those present.

Ancient and Modern.

We have often wondered why it is so often found necessary to house electrical enterprises in sham antique premises, and only a few days ago this wonder was revived when the Yarmouth Electricity Department opened its new electricity showrooms and offices in what is described as "a fine Tudor building." While the adaptability of electricity permits its dignified use in authentic period settings, such as are provided by many of our old country houses, churches and ancient public buildings, we cannot help feeling that its normal setting should be suggestive of modernity. Electricity is a force of the present, and still more of the future, and to deliberately choose to demonstrate its vitality in an archaic setting seems quite unnecessary. Modern equipment designed for use in modern homes cannot be seen to advantage in mediæval surroundings, and, in any case, the unnecessary admixture of ancient and modern seems logically indefensible. We appreciate that many business houses have adopted period designs for their showrooms and premises, but we cannot see any good reason why such practice should extend to our industry.

Our Overseas Trade.

June, 1929, was the first month since 1926 during which our overseas trade as a whole did not register £50 000 000 in exported goods. The May figures, which appeared to confirm the good prospects suggested by April, were apparently misleading, for exports during last month were down by £17 544 000 when compared with the returns for the preceding month, and down by £9 579 000 when compared with June, 1928. That trade was generally poor during last month is also indicated by a drop in imports of over £11 000 000 when compared with May, and over £8 000 000 when compared with June of last year. With regard to our exports, it may be noted, however, that the total for the second quarter of the year was £177 574 000 this year, £173 295 000 last year, and £171 868 000 in 1927. Commenting on the exceptionally low level of the June figures, "The Board of Trade Journal" states that the returns "may be the effect of variations in the promptitude with which, at different times, the returns of exports are furnished by the Customs authorities, and of the changes in dates of public holidays." In comparison with a year ago, the falling off in June was mainly due to a decrease of £9 642 000 in the value of exports of manufactured goods, but, notwithstanding these facts, the visible excess of imports over exports was not so high as might at first appear to be the case, the balance being £31 989 000 last month, as compared with £28 426 000 a year ago.

The Electrical Position.

So far as the electrical industry is concerned, the Board of Trade Returns, from which electrical details are published elsewhere in this issue, show that June, 1929, was no less unkind to our own trade, for exports of electrical machinery alone declined by £116 365 when compared with June, 1928, while electric wires and cables, including submarine cables, declined by £61 449. Imports of electrical apparatus and machinery during June increased by £147 544 by comparison with the same month last year, more than half this amount being accounted for by telegraph and telephone instruments, which item alone showed an increase of £76 164. A moderately satisfactory trade balance of exports over imports for the six months is still maintained, however, the amount being nearly six millions sterling, and though this is something like £500 000 less than the corresponding amount for last year, the electrical industry has lost less ground than many others. In a way, the low figures for June may subsequently prove a blessing, for they indicate to manufacturers as a whole, that unless the overseas markets are given proper attention, irrespective of shortage of staff due to summer holidays, and so on, the business quickly falls away and much spade work requires to be done all over again.

Imperial Communications.

Amongst the recommendations of the Imperial Wireless and Cable Conference, which were approved by the House of Commons last year, was one suggesting that a committee be set up to act in an advisory capacity with respect to telegraphic communications. The committee has now been formed, with the style the Imperial Communications Advisory Committee, and the body will be concerned with the policy of the new Imperial and International Communications Co. This latter company, another adopted recommendation of the same conference, will be responsible for services, rates, etc., and may be regarded as the operating company formed in connection with the merger of the Marconi and the Eastern and associated cable companies. A main feature of the scheme is that the Communications Company is to receive a net revenue of £1 865 000. After 12% of any excess of this amount has been paid to the Post Office, 50% of the balance is to be used for reduction of rates or for other purposes approved by the advisory committee. The remainder of the balance will then be distributed as additional dividend to Cables and Wireless, Ltd. It will, therefore, be appreciated that the work before the new committee is of considerable importance, and though the men forming such committee have wide and varied experience, their activities will be watched with more than usual interest, the reason, of course, being that though the investing public is concerned with Cables and Wireless, Ltd., it is the Communications Company which really decides the wisdom or otherwise of their investment.

ELECTRICITY AND THE "TOTE."

Details of the Electrical Equipment of the Machinery—Electrical and Electro-Mechanical Operating Methods Explained—Some of the Constructional and Working Features of Three Types of Machine.

By D. H. N. CALEY.

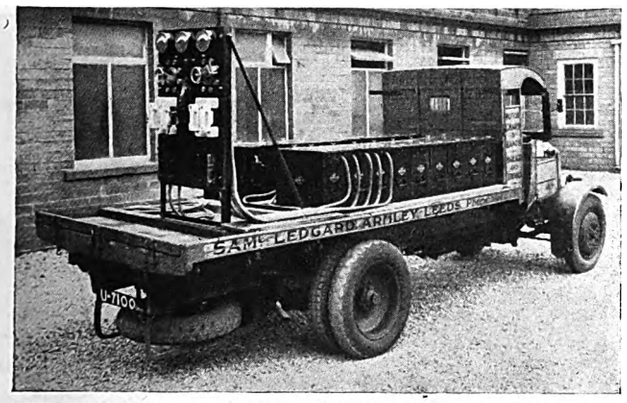
ON July 2nd, totalisator betting became possible on an English racecourse for the first time. This article aims to describe as fully as is possible at present the operation of the totalisator as viewed from an electrical standpoint. It must be realised in the first place that the machines used at Newmarket and Carlisle during the present month were not fully automatic.

Although the system of totalisator betting now being used is essentially the same in principle as that employed in the fully-mechanised "Tote" which is to follow, in the present machines some of the operations have to be performed manually, whereas in later totalisators each cycle of operations will be completed without any human intervention, once the key of a ticket-issuing machine has been depressed by a ticket seller.

Sequence of Operations.

In order that the totalisator may be more readily understood it will be well to say a little about the tasks which it is called upon to perform. When a bet is made the sequence of operations is as follows. (In the case taken here the bet is assumed to be of unit value for the sake of simplicity.) A ticket is stamped and produced from the ticket-issuing machine; the bet is registered, and added to the total of bets on the particular horse; the grand total of bets is also increased by one. The increments are immediately shown to the public on the two indicators giving respectively the total of bets made on the individual horse and the grand total. All makes of totalisator may be envisaged as consisting of three main parts: the ticket-issuers, which are installed in booths in various parts of the course; the adding machine, which is centrally situated; and the indicating boards, on which are displayed the numbers assigned to each of the horses, the number of bets made on each and the grand totals of bets, win and place. As bets are made and tickets are issued, the corresponding figures are immediately communicated to the adding machine, and thence automatically to the notice boards of the indicators.

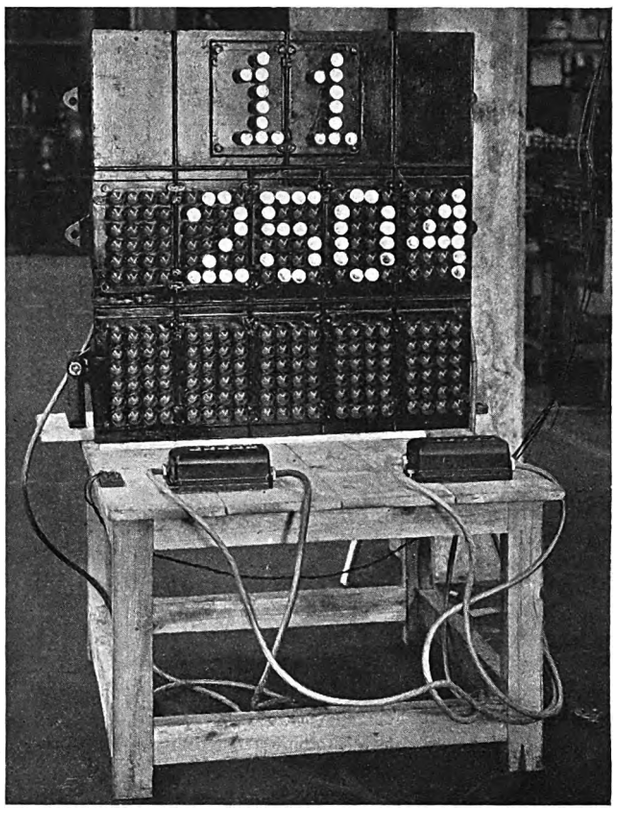
These processes may be effected either electrically or electro-mechanically. Moreover, the figures on the indicator boards may be displayed by the lighting of electric lamps on the principle of the Mason monogram used in sign work, or by means of revolving drums bearing the various figures. The all-electric system is chosen by the British Automatic Totalisator Co., who also make use of illuminated figures for the indicator



A 54-cell 500 Ah battery mounted on a lorry with the necessary switchgear for the first totalisator at Carlisle. Six of these batteries, made by the D.P. Battery Co., are to be used by the Racecourse Betting Control Board, and will travel round the country from meeting to meeting. In the Carlisle totalisator 10 000 lamps are used to indicate the numbers.

boards. The operation of the Lightning Totalisator is partly electrical and partly mechanical, and revolving drums are used for indication. Electro-mechanical working has been chosen for the Hamilton totalisator of Graham Amplion, Ltd., and monographic lighting is utilised on the indicators.

Two systems of ticket issuing have been adopted as standard in totalisators used abroad. In the first, separate tickets, similar to those used on railways, and partially pre-printed, are used. In the second, the tickets are guillotined off a roll, and entirely printed at the moment of issue. The ticket issuing machine used with the Lightning Totalisator in Australia is of the first class, which, by the decision of the Race-



Hand-operated electrical indicator in course of construction at the Amplion works at Slough.

course Betting Control Board, is not admissible in this country. The Lightning Automatic Totalisator Co. are therefore installing ticket issuing machines of the instantaneous printing type, manufactured by The British Automatic Totalisator Co., who are supplying similar machines to each of the firms manufacturing totalisators in England. It is now proposed to give some descriptive details of three makes of totalisator.

Electrical Indicators.

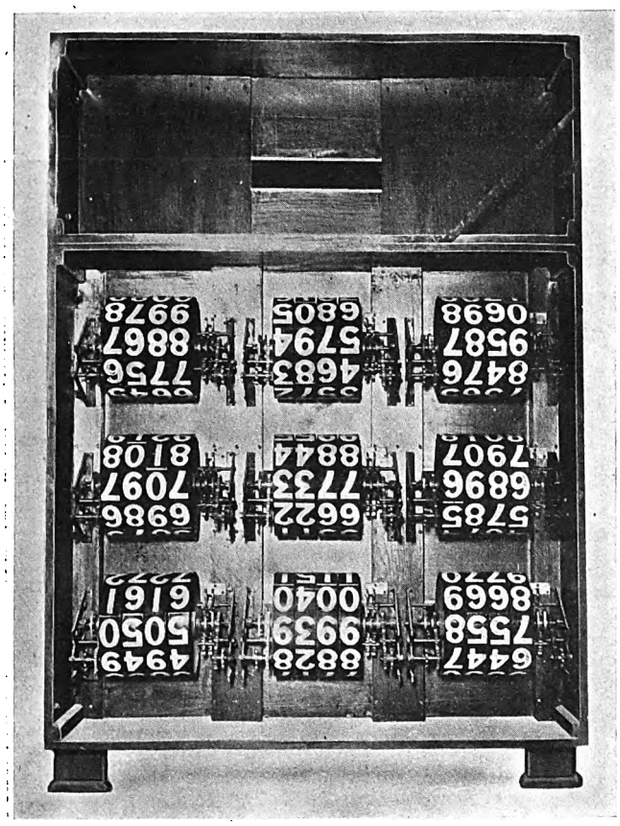
The Hamilton Totalisator, produced by Graham Amplion, Ltd., of Slough, and 26, Savile Row, Regent Street, W.1, has several interesting features. An accompanying illustration shows one of the hand-operated electrical indicators which are forerunners of the complete totalisator; these indicators are being used at various race meetings to be held in the near future.

Apart from the pre-selector switches of the Automatic Telephone Manufacturing Co.'s type, which take the place of a mechanical commutator in operating the lamps in each monogram, these indicators are comparatively simple. The operator sets the small rotatable drums of the switching device in such a way that the uppermost figures on the drums correspond to the total of bets made, and the lamps applying to the figures forming the total are thereby lighted. For example, the setting in the illustration, reproduced above, indicates that 2 504 bets have been made on horse No. 11. The switching devices—referred to above—may be seen resting on the wooden shelf in front of the indicator, linked by cables with the main selecting mechanism at the back. The pre-selectors each have six arms fitted with five blades. There are twenty-four lamps in each monogram.

The first fully mechanised totalisator is to be in use at Hurst Park on August 23rd, and it is much to the credit of Graham

Digitized by Google

Amplion, Ltd., and the inventor, Mr. R. M. Hamilton, that this, the first complete " Tote " to be installed, will have been designed and constructed within five months. This quick progress was made necessary by the Hamilton " Super Totalisator " (described below), which was conceived earlier,



Back view of the individual horse adding machine (Lightning Automatic Totalisator).

not falling within the specifications of the Racecourse Betting Control Board.

The main totalisator building at Hurst Park will be about 30 ft. high, the actual integrating mechanism being in the upper story. The adding apparatus of the Hamilton Totalisator is shown to be quite compact by the fact that it is all contained in four boxes, size 12 ft. by 3 ft. The position chosen for the main building is one as far as possible removed from the main part of the crowd. Some 500 ft. from the totalisator itself, one of the principal indicator boards is placed; it is double-fronted so that the state of betting can be observed from both sides of the course. Selling stations, comprising ticket-issuing machines, are located in various suitable spots; station B, near Tattersall's, caters only for those desiring tickets of high denominations, and is comparatively small, while the other ticket-selling stations are of varying sizes, according to the demand anticipated in different places.

Safeguards Against Inaccuracy.

The sequence of operations in the Hamilton totalisator is as follows:—When the key of a ticket-issuing machine is depressed by the operator in the booth, a circuit is closed, and current through it actuates a solenoid. Movement of the solenoid core does two things—it imparts, by means of a ratchet mechanism, angular motion to a rotatable spindle corresponding to the horse backed, and it closes an independent circuit. Current in the latter drives the motor in the ticket-issuing machine, and the ticket is printed, guillotined, and ejected. (It is therefore impossible for the ticket to be issued unless at the same time the bet is recorded—any breakdown results in the second circuit remaining open, so that no ticket can be obtained from the machine involved. This point is an important feature of the design, as it obviates the chance of inaccurate odds being given.)

Meanwhile, impulses proportional to the angle through which the rotatable spindle has turned are passed on to a pre-selector switch belonging to the first bank of such switches, and as a result the figures corresponding to the new total are electrically illuminated.

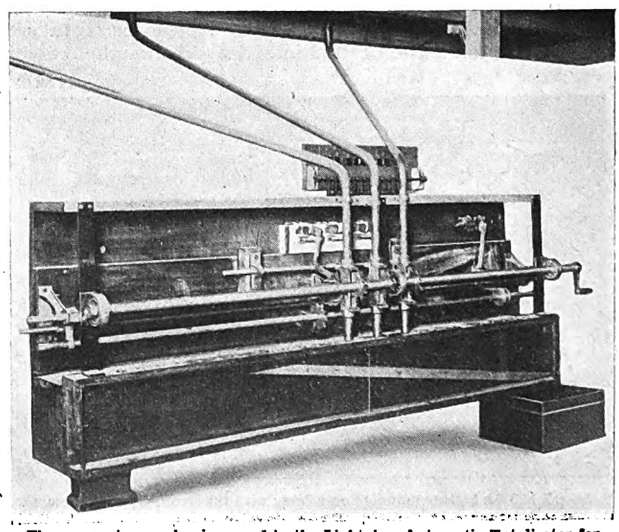
On its return path, the current also actuates the grand total solenoid, which is connected in series with all the solenoids belonging to each ticket issuer. The grand total solenoid imparts angular motion to a rotatable spindle through a ratchet mechanism, the arrangement being similar to that used in connection with the horse solenoids; the appropriate lamp circuits on the grand total indicator are thus energised by the action of a pre-selector. The cycle is then complete. Should, however, any electrical or mechanical breakdown have occurred in any part of the circuits, an ingenious system of subsidiary circuits will have ensured that the appropriate warning bells be rung, in order that errors in the totals may be avoided. Provision is also made for rapid tracing of the fault.

Especially noteworthy is the Hamilton mechanism for converting the initial electrical impulses from the ticket-issuing machines into mechanical motion with its magnitude proportional to the amount of the bets. Two things have to be achieved: (*a*) that the motion due to the bet made at one machine shall be proportional to the number of 2s. units represented by the amount of the bet, and (*b*) that the aggregate motion due to the various bets laid on the horse at different windows simultaneously shall be proportional to the total number of 2s. units represented by all these bets. These effects are achieved by arranging the solenoids in a straight line so that each imparts motion—through a ratchet mechanism—to the same spindle.

The core of each solenoid is connected with a driving pawl and a holding pawl, which work on a rotatable member which is also free to slide. The rotatable members are each in mechanical contact with the main spindle, the core of the solenoids being free to rotate, even while they are energised. Each impulse superimposes the angular movement of one ratchet tooth on to that caused by impulses given to solenoids positioned further back in the line. The angle through which the main spindle turns is the sum of the angles through which each of the rotatable members (referred to above) turns simultaneously.

Comparatively Simple Wiring.

So that the operators may know the state of betting at any moment, and be able to keep a record of the figures should temporary breakdown of any part of the machinery threaten the correctness of the " Tote's " calculations, dials are affixed to the pre-selectors which are controlling the indicators, and these are used to read the totals. An examination of circuit diagrams in the totalisator section of the company's Slough



The convertor mechanism used in the Lightning Automatic Totalisator for converting the varying denomination bets into a common denomination.

works showed that the Hamilton system enables the wiring to be made comparatively simple—an excellent feature from the point of view of total cost. The individual collector element is reduced almost to its bare essentials, and the number of lines of wire is small compared with some other systems, owing to the fact that the collectors do not require a prime mover, and can be placed close to a group of booths in much the same way as a telephone relay box is situated in a private branch exchange. The pre-selector switches used are manufactured by the General Electric Co., Ltd., at their Coventry Telephone Works.

Digitized by Google

Returning to the Lightning Totalisator, its operation will be described as clearly as is possible with limited amount of information at the writer's disposal. This "Tote" is manufactured by the Lightning Automatic Totalisator Co., of Radlett; Mr. Thomas E. Ward is the inventor. When a bet is made the ticket seller depresses a key bearing the number of the particular horse, and thus, as in other makes of totalisator, closes a circuit. As soon as current passes, a steel ball of $\frac{5}{8}$ in. dia., is released from a receptacle contained in the main machinery in the chief totalisator building. It will be seen that, like the Hamilton, the Lightning Totalisator works electromechanically, the initial mechanical impulse of pressure on the key giving place to an electrical impulse, which is reconverted to the purely mechanical step comprised by the movement of the steel ball. It is claimed by the company that this practice of using steel balls as the main link between the selling and integrating sections of the machine gives greater assurance of positive action than a purely electrical cycle of impulses.

The released ball—or balls as the case may be—will represent a bet of a denomination of 2s., £1, £10, or £100; when released by the primary impulse which issues the ticket, they are free to travel under the action of gravity to the parts of the totalisator mechanism known as the convertor and the adding machine. Here their function is completed. A tube with a device for setting the ball in motion is provided to correspond with each of the keys in all of the ticket selling windows. The total number of tubes therefore equals the product of the number of horses by the number of selling windows.

The purpose of the convertor is to bring the varying denominations of the bets to a common denomination, so that final integration may be possible. The operation of the convertors and adding machines is similar in that in each there is one continuously driven shaft, operated by an electric motor, while both these machines can only perform their functions through the medium of the steel balls. In the illustration of part of the convertor mechanism on page 72 can be seen three of the tubes for conveying the balls.

After a ball has actuated the adding machine corresponding to the horse in which the bet was made, it passes on to the grand total adding machine. The Lightning Totalisator is stated to differ from all other makes in respect of all calculation and addition being effected mechanically (although the motive power is electrical). The process chosen is claimed to be quite certain in its action, very little power is required, and the amount of cabling necessary is relatively small. First cost and maintenance charges are said to be low. The voltage required is 20.

The transmission of the totals from the adding machines to the large indicator boards at various points on the course is made electrically. Hand control, however, is employed in the Lightning Totalisator, the reason advanced being that by this system the progress of betting—increasing by units, tens, hundreds or thousands at a time, according to the rate of betting—can be readily seen at any moment. It is said that if the alternative system of automatic recording were employed, it would not be possible for the public to have a clear vision of the indicator board corresponding to any particular horse when betting on that horse was heavy; if the increasing numbers of the bets were to be changed automatically, either by tens or units at a time, the number wheels would revolve so quickly as to be practically illegible. The advantage in the case of the grand total indicator would thus be even more marked.

Since there is a separate circuit for each of the keys (at different windows) applying to the same horse, the load on the mechanism corresponding to that horse is no greater when the same backing is going on at many windows, than when one ticket only is being sold. Overloading is therefore impossible, and, indeed, the Lightning Totalisator is emphatically claimed to be entirely foolproof. Safeguards to prevent any jamming or overriding of the steel balls are provided. The machine is capable of issuing more than the 50 tickets per minute called for in the Control Board's specification, although in practice it is found that this rate of issuing is seldom achieved, even where there is a big run on a favourite.

(*To be concluded*).

SUBMARINE TELEPHONE AND POWER CABLE—FROM WORKS TO USER.

PICTURESQUE scenes in the transport of British submarine cables are illustrated in these pictures. To the right the c.s. "Faraday" is seen off Siemens Bros.' Woolwich works loading up a submarine telephone cable. The pictures below show stages in the unloading, from the s.s. "Brenavon," of 54 000 ft. of Siemens extra high tension submarine power cable for laying across the Straits of Penang.

"ELECTRICAL SECURITY."

A Valuable E.C.A. Publication for the Information of Architects and Electricity Consumers—The Value of Sound Electrical Installations Emphasised—Informative Examples of the Relative Cost of Good and Bad Work.

By A CORRESPONDENT.

"ELECTRICAL Security," the handsome 50-page booklet dealing with electrical installation work—good and bad—which has been produced by the Electrical Contractors' Association has already been the subject of favourable comment in THE ELECTRICIAN, but I have been asked to deal with the publication in greater detail, in view of its importance to all sections of the industry.

The work opens with a preface written by Mr. Walter Tapper, President of the Royal Institute of British Architects. In frankly acknowledging that the final touches of internal beauty and comfort in public building or private residence are provided by a well-planned electrical installation, he maintains that "no other system of lighting provides the same flexibility, adaptability, convenience and charm, while every day that passes witnesses an increasing use of electricity for a multitude of heating, ventilation, cleaning and other auxiliary power services in every type of building." It can hardly be gainsaid that many architects of to-day seem strangely ignorant of the possibilities of electricity in the home, and it is to be hoped that they will give earnest attention to the advice of Mr. Tapper and to the general contents of the booklet.

The introduction sets out in a clear and reasonable way the reasons why the architect and the public generally should take more interest in the electrical equipment of residential and other property. The reasons are summarised under two headings:

(1) Because electricity has already become something much larger and much more vital than a "lighting agent"; and (2) Because the public supply of electricity is passing through a period of substantial change and development, involving the replacement of direct current supplies at a low pressure by alternating current supplies at a higher pressure.

These points are briefly developed to lead up to an exhortation to architects and the public to concern themselves very seriously with the layout, quality and workmanship of the electrical installations coming under their care or use.

Choice of Wiring Systems.

In the first chapter wiring systems are discussed under the three main headings: steel conduit, hard metal-sheathed cables, and tough rubber covered wires. The comparative advantages of these methods are set out, and the reader is left free to make his own choice. The choice of a system is, however, dealt with in general terms in the next chapter, and on the cost basis the reader is told that if the total cost (labour and material) of a welded screwed steel conduit system is represented by the round figure of 100, then the cost of a grip-continuity brazed conduit system may be represented as 90, that of a metal-covered or lead-alloy system as 85, and that of a tough-rubber covered system as 80.

Next comes a chapter on "The Spirit of the 'Regulations,'" in which the I.E.E. Rules and their significance to the consumer are simply explained. Some of the cheap and hazardous "dodges" used by the shoddy worker who ignores the Regulations are set out, and the public are asked to demand that their installations are carried out in accordance with the "Wiring Regulations" of the I.E.E. It is also pointed out that the supply authority's test of installations preparatory to connection to the mains provides no guarantee that the work has been well done.

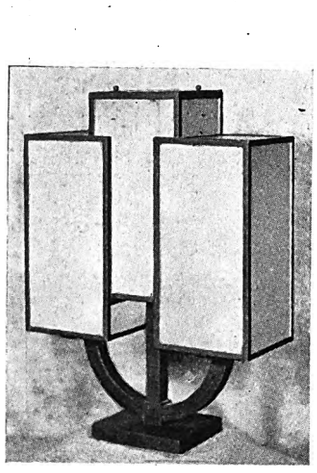
Earths and Earthing.

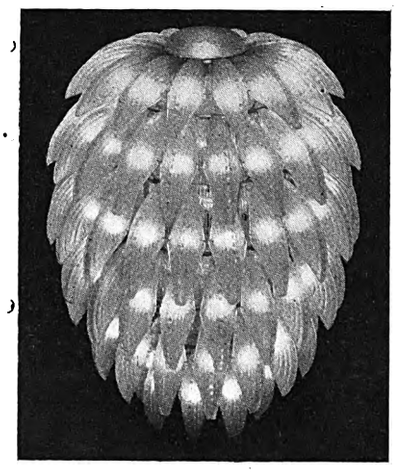
"'Earths and Earthing.'" the subject of the next chapter is still a subject of contention in the industry, but here the question is dealt with very fairly, and in a way well calculated to attract converts from the non-earthing school. The dangers consequent on the use of unearthed apparatus in certain situations at a.c. voltages of from 200 to 250 are clearly indicated, but the treatment is not on panicky lines.

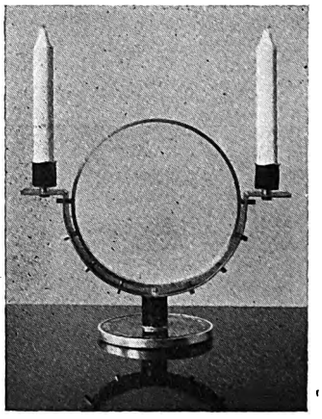
Little space is left for detailed survey of the remaining contents, which include a valuable chapter on "Modern Installation Work" with concrete examples on good and bad work, an architect's lighting, heating and bell plan for a small country house, and contrasted bills of quantity showing detailed costs of materials necessary for a good and a bad job respectively.

A further chapter is devoted to "Some Notes on the Components of a Wiring Installation and their Prices," and finally "Use and Maintenance" is discussed and attention given to amateur extensions and wireless, and electro-medical apparatus.

The booklet, which is well bound in stiff boards, contains no Association propaganda, and may be truly said to be a primer for the architect and consumer. A notice on the last page states that "where the professional or trade standing of any firm of electrical installation engineers is in question, reference should be made to the list of members of the Electrical Contractors' Association (Incorporated), 15, Savoy Street, Strand, London, W.C.2, and / or to the National Register of Electrical Installation Contractors, 1, Lincoln's Inn Fields, London, W.C.2."







FURTHER EXAMPLES OF MODERN LIGHTING FITTINGS DESIGN.

THESE fittings, illustrating recent tendencies in Continental designs, show (left to right) a table lamp of forged iron and opalescent glass designed by Georges Champion and produced by the Studio Gué; a crystal chandelier designed by Sabino (Paris), and candelabra, in red enamel with silver edges, designed and made by the Städt. Handwerker and Kungstgewerbeschule, Stettin. We are indebted to the proprietors of the "Studio" Year Book for permission to reproduce these designs.

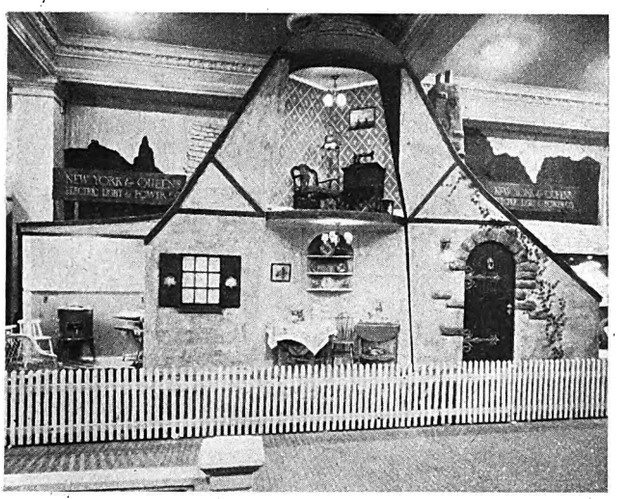
STAGECRAFT IN ELECTRIC HOME DISPLAYS.

Dramatising the Selling Story—Making the Best Use of Restricted Display Space—An Effective Turn-Table Exhibit—A Trade Procession Hint—Window Backgrounds.

By ERNEST A. DENCH.

ONE by one, stagecraft tricks are being tried out on an unsuspecting public. Not that there is any intent to deceve the consumer; the trickery is confined to the dramatisedi presentation.

After all, the true art of display—the pictorial mode of expression—is nothing else but a dramatised selling story, best unfolded with a theatrical atmosphere. The theatrical producer has an imposing stage on which to work, aided, too, by all the paraphernalia of his craft. The electrical retailer's "fighting line" includes the show window, the showroom,



A model revolving house exhibit on a small scale, the working of which is explained in the accompanying article.

possibly a converted truck for a demonstration car, or a small stand at an exhibition. Space limitations are present with all these display mediums, especially if the desire is to reproduce a series of model rooms equipped with every conceivable electrical outlet and device.

A few years ago the display man of a supply undertaking cried: "I have it," as though it was a remarkable discovery, one which would revolutionise display methods. The ingenious idea was a two-in-one painted background. One side was "summer," the other, "autumn," and the side shown to the public varied with the seasons. Yet we could never see much practicability in the plan, other than the saving of a strip of composition board.

If the display man had thought out such a seasonal presentation plan as that embodied in the layout of a millinery shop "down South," known as "That Hat Garden," he might have been in receipt of a bonus from his employers. Inside, this shop is "strictly rural"; the hats are arranged on small "trees" about tables spread with artificial grass mats for lawn. Cotton wool replaces the "lawn" in winter. The patron enters the store under a latticed arch, entwined with seasonal flowers and foliage. The rear, merging into the stockroom, is "blocked" with the false front of a country cottage. Here, too, the "atmosphere" is changed according to the time of year. The permanent features remain, the changes being matters of detail.

The Two-Tier Turn Table.

Now, every public utility undertaking and every electrical contractor has, at some time or other, found it hard to give a display exhibit "breathing space" within the compass of a local exhibition stand. The model home idea has meant the leasing of an actual suburban home in the vicinity, the disadvantage being its inaccessibility, apart from the separate staff needed.

The New York and Queen's Electric Light and Power Co. having found no solution to the problem, engaged a display service company to bring their special technique and resources to bear. The result was a realistic reproduction of a six-room house inside a stand, 44 ft. long by 20 ft. high. I admit the feat sounds impossible, but stagecraft carried it off in a convincing manner.

All you have to do (after viewing the accompanying picture) is to visualise the front wall of this modern house "broken away" to "cut" into the suite of six room interiors, which came into view, two by two, as the double-decked turn table (10 ft. wide) slowly moved into position and paused a couple of minutes before turning again, to bring the next two rooms into view. Beauty and utility were combined in these room lay-outs, as the following high lights will prove: The hand-carved mantel and relief coat of arms in the Tudor living room. The bathroom with walls painted to simulate the tropical environment beneath the ocean's depths; the rest of the bathroom was of cream-tinted tile, coloured fixtures and semi-indirect lighting. The blue-tiled kitchen had its share of admiration, while the dining room was equipped in Colonial style. Both the sewing room and bedroom were designed on pleasingly simple lines.

Off "stage," so to speak (meaning to the sides of the turn-table exhibits) were two stationary rooms. At the left, a green-tiled laundry nook, with its opportunity to display washing and ironing machines. At the right, a modern garage, completely equipped with electrical devices to conserve energy and facilitate comfort.

Modern Kitchen *v.* Dance Steps.

Space-conservation was not the goal aimed at by the Southern Colorado Power Co., Pueblo, Colorado, for the "float" they entered in the State fair "Parade of Progress." The spectators lining the streets several deep were in a mood for entertainment, so display manager T. A. Edmiston wisely played on this in arranging his utility display. This long float, mounted on a truck body, was especially colourful with its gay awning roof and the pleated vari-coloured drapes in "sun burst" effects around the chassis. The float platform was split up into three sections. The first, facing front, was where the public was regaled with entertainment by a group of five pretty girls recruited from the company's force, who played ukeleles and banjos. This section was enclosed at the back with vine-twined trellis, dummy columns and another "sunburst" of vari-coloured drapes. "Concealed" here was the driver. Facing the street at each side was a sign, cleverly comparing modern dances with electrical cooking:

> "You May Have Tried the ONE STEP AND THE TWO STEP
> —BUT—
> Do You Know the Third Step?—
> COOK WITH ELECTRICITY."

With an eye to dramatic effect, progressing, as you will note from strictly entertainment, thence to partial entertainment (the card) and thirdly to "strictly business"—the rear section of the float was arranged as a model white enamel kitchen, with every electrical device in place, from the modest iron to the pretentious refrigerator.

"Cook By Wire" read the sign over this section. For the night parade, white-frosted lamps supplied the illumination.

A Solid Background for Kitchen Setting.

Many model kitchen window display backgrounds lack substance. They are, to put it mildly, of the "jerry-built" variety. One push and the whole bag of tricks topples over. Make-shift devices to convey the room atmosphere are not very convincing, to say the least. Overhead costs are, of course, responsible for the cheese-paring. It is not to be expected that any business-like enterprise will incur a substantial outlay for an equally substantial background without a fair return.

The Illinois Power and Light Corporation recently spent £40 on a really substantial background, and found no cause to regret their thoroughness. The background, which was the interior of a model kitchen in green and white, was provided with doors and windows that looked as if they had been there for generations. The lower half of the walls was mosaic tiled, and mottled wallpaper was used for the top half. The rear right curved into a completely furnished breakfast nook.

ADVERTISING FOR CONTRACTORS.

Necessity for Originality in Retail Trade Advertising—Knowledge of Human Nature Requisite for Success—Persistence and Continuity Recommended.

By "PUBLICITY CONSULTANT."

(*Continued from page 757, Vol. CII.*)

EVERYBODY is yelling for originality, and most people yelp with nervousness when it comes along. This observation, made by another writer in another connection, seems to apply with particular force to much of the advertising that appears in our provincial and suburban newspapers to-day. The possibilities open to the advertiser are enormous. Like the artist, he has, in his piece of white newspaper space, a canvas on which he can fashion something individualistic and eye-taking; something to linger in the minds of those who are fortunate enough to read it. Such opportunities, often as they occur, are rarely made use of, and the advertising of a retail advertiser in one trade is very much like that of his opposite number in any other trade. Originality, or anything approaching it, appears to be shunned like the plague, and "Safety First" and "Follow my leader" form the usual watchwords.

After a long study of the advertising of retailers, the writer has been driven to the view that the tameness referred to is due to sheer fright at the prospect of having to write advertising copy. No matter how well and convincingly the average trader talks to his customers when they are in his shop, he usually loses this faculty when he addresses them from the pages of the local newspaper. In the shop he will put the good points of a fire, an iron, or a washing machine in a way that is both interesting and convincing. In an advertisement—which, by the way, is really nothing more than a convenient way of "broadcasting" sales-talk to a wider circle than the solitary customer—he will forget all his arguments and selling points, and will, for some obscure reason, content himself with a laconic statement of his name and address coupled with a list of articles which may be obtained at that address.

Another curious feature is that while most of us know instinctively whether the "copy" of somebody else's advertisement is good or bad, we seem unable to detect the weaknesses in our own productions.

Readers will admit that success in retail selling is dependent to a very great extent on our knowledge of human nature. Such knowledge is equally necessary for success in retail advertising. We should analyse the working of the human mind, and find out, if we can, what other people think about our advertisements, about our goods, and about the way in which we sell, or attempt to sell, our wares to them.

If we can then combine with this qualification a sound knowledge of good business and a few simple facts about advertising we have the best possible equipment for success.

The great essential in the writing of advertising copy is the capacity for being natural. Some people have a gift for copy writing, but those who have not—or think they have not—need not despair. The best procedure in such cases is to write down exactly the sort of things you would say to a customer who entered your shop, and to whom you wanted to sell a certain article or articles. Write it all down, however much there is of it. Then go through it carefully and select what seems, on consideration, to be the very best of the selling points. By taking these, and eliminating all redundancies, you will have the material for an effective advertisement. After a time practice will render such a tedious procedure unnecessary. At first, however, the exercise provides really excellent tuition.

Some of my readers may have been induced to approach the writing of copy by the mistaken method under which the first paragraph *must* excite interest, and the next *must* create a desire for possession, this being followed up by convincing facts to inspire confidence. Finally the copy *must* impel action. I would not attempt to deny that an advertisement which can cause all the above-mentioned reactions in their logical order is entirely admirable, but generally impossible.

One can never count upon securing the reader's attention long enough to get his mind thinking in an orderly way; it often happens that many people will read an advertisement from beginning to end, but we should never assume such close interest. Our best assumption is that nobody has any particular desire to read any advertisement. The paper is usually bought for the news it contains, and advertisements will only be read if they are interesting and attractive.

But even if our newspaper announcements are made the last word in interest and attraction, there is no certainty that they will always influence people in the way we intend them to.

Let us take, for instance, the case of a man sitting down after breakfast on Sunday morning to read his paper. He is a good prospective purchaser of a shirt which is advertised on page six. But just as he has reached page four his wife calls and asks him to see what is the matter with the back door, as it won't latch. The dutiful husband naturally goes off to attend to the door, but he does not return to that section of the paper which was going to stimulate him to a purchase, so that all the thought, time, energy and money put into that advertisement is wasted—so far as this man is concerned.

Now, if there are enough broken back doors that Sunday morning, and enough husbands willing to play the rôle of handy man, the advertiser will conclude that his copy for his shirt advertisement was poor, or that the announcement was lacking in some other way. Actually, the copy may have been excellent, the value good, and the real fault may have been in advertising to men on Sunday when they are subject to distracting assignments in the domestic utility field.

This example may sound unduly pessimistic, but it is an undoubted fact that some distraction or other may completely neutralise all the advertiser's efforts to interest any particular person. Hence the need for persistence and continuity of advertising. The reader who failed to get as far as your advertisement on Monday may be in a more receptive mood on Wednesday.

A large, but fortunately declining, number of newspaper advertisers appear to think that very big, bold, black type is essential to successful advertising. Apparently the idea is

Fig. 1.—A terse announcement which offers no sales argument.

Fig. 2.—An example of over-crowding, and the uninteresting use of type.

Digitized by Google

that the advertiser, in order to draw attention to his announcement, should use a type-face of such size and ugliness as to out-distance his fellow advertisers in an orgy of ugliness. The result is that the whole of the advertisements designed

Participation in local carnivals is a useful phase in contractors' advertising activities. The illustration shows the decorated car which Mr. B. L. Kay entered in the Colchester Hospital procession on July 11th.

on this assumption become insignificant, simply because of their multiplicity; on the other hand, the advertisements which are set up in less blatant founts of type, and which are at the same time tastefully arranged, achieve far more than their garish neighbours.

It should be pointed out, however, that in his desire to find type-faces of pleasing appearance, the advertiser must not lose sight of the fact that the type he chooses must be legible. However attractive his announcement may appear, it will lose much of its effectiveness if the public cannot read it with ease. Some types are notoriously tiring to the eye; people soon discover this for themselves, and the weary eye may pass over an otherwise good advertisement solely on this account.

Although the example reproduced in Fig. 2 is a fairly typical example, and no worse than scores of others, it well illustrates the need, to which I have referred, for care in the selection of type. Apart from the overcrowding of the space, the type, though legible, is ugly and uninviting.

The opening of the new showrooms and offices of the Yarmouth Electricity Department last week was made the subject of an attractive composite page of advertising in the "Yarmouth Mercury," which is reproduced in miniature in Fig. 3. It will be noted, however, that the page is supported exclusively by manufacturers. Without knowledge of the local conditions it is impossible for me to say whether local electrical contractors had the opportunity to occupy a portion of this special page. But even if participation in the all-electrical page had been impossible, one might not unreasonably expect to find a number of contractors' advertisements on other pages. Actually, a diligent search only showed one. This effort, reproduced in Fig. 1, is praiseworthy in its way, and its sponsors have evidently realised that the ready-made local interest in electricity, engendered by the opening of the electricity showrooms, can be directed into a practical channel, if only people are told where to go for their electrical requirements. From the copy point of view, Fig. 1 is capable of improvement. Mid-July seems a little late to talk about "Spring Cleaning," but as electric vacuum cleaners are to be included in the announcement, there is an opening for a reference to "Spring Cleaning Every Day." This could be followed by a short, reasoned paragraph about the work which is saved by electric vacuum cleaners, floor polishers, and such other labour-saving devices.

(To be continued.)

BOOK REVIEWS.

Whittaker's Electrical Engineer's Pocket-Book. Edited by R. E. Neale. (London: Sir Isaac Pitman and Sons.) Sixth edition. Pp. xiii+775. 10s. 6d. net.

This compact work is already so well known that detailed review of the sixth edition is really unnecessary, though it should be mentioned that this issue has undergone thorough revision and is larger by about 100 pages than its predecessor. In spite of the rigid compression necessary to keep a work of such encyclopædic character to anything like the dimensions of a pocket-book, the compilers have produced a useful and readable compendium. A. C. B.

"Swift" Percentage of Weight Reckoner. (London: Gall and Inglis.) Pp. 90. 4s. net.

No simple system has yet been devised for doing proportion sums, and those who have to be constantly working with varying ingredients do not always find the slide rule as definite as they wish. The "'Swift' Percentage of Weight and Weight Computing Reckoner" has been designed to give the varying percentages of weight from ½ oz. to 9 lb., and lbs. from 1 lb. to 150 lb., that have to be used in calculating the ingredients of any batch. This makes easy reckoning for Customs' Duties, proportioning quantities, varying ingredients, etc. A supplementary use of the tables enables the total weight of any number of articles, each weighing from ½ oz. to 9 lb. to be calculated out, and a consignment checked; or in stocktaking, the uncounted quantity of an article on hand to be found simply by taking the weights.

West Ham Corporation is about to apply to the Electricity Commissioners for sanction to a loan of £33 461 for sub-stations, transformers and equipment.

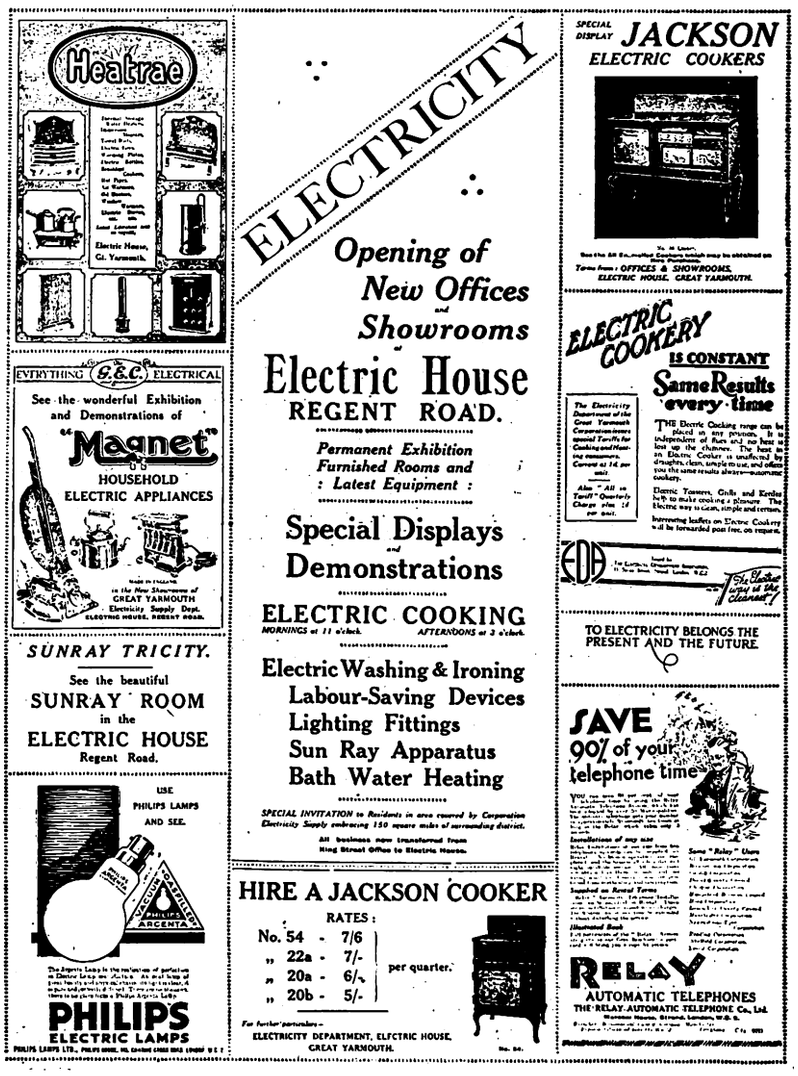

Fig. 3.—Miniature reproduction of full page advertisement synchronising with the opening of new electrical showrooms at Yarmouth.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Concrete Pole Problems.

[To the Editor.]

Sir,—Replying to the remarks of S.C.B. in your issue of July 12th, the writer desires to say that it was not expected to draw attention to annual costs of the different kinds of pole lines.

In view of the fact that the annual costs must account for interest on the first cost, life of pole line materials, cost of maintenance or upkeep (which must include relative expenses due to interruptions), it is logical to expect a wide difference of opinions and values from the different engineers. The cost items given were purposely condensed.

The range of depreciation annuities for wood poles is from 3 to 12% and for sawn timber (which should never be allowed in any wood pole line, for poles or struts) as high as 40%. The writer used a mean value of 6% for wood poles, and 4% depreciation annuity for the remainder of the line. This latter value applies also to the steel and the reinforced concrete pole lines, respectively. For the steel poles the writer has taken a depreciation annuity of 1.3%. For reinforced concrete we are quite justified in taking 0.5%, but the writer has almost doubled this value. Obviously, decreasing the number of poles per given length of line, or increasing the life of the materials, or increasing the interest on capital, will result in a decrease of depreciation annuities, and, for all these conditions, the wood pole is the least favourable.

In calculating the annual expenses, it is to be noted that the depreciation cost of wood pole lines should be figured from the cost of replacing the poles, and not from the first cost of a new wood pole line. It is always more costly to replace old poles than to erect new poles. The higher cost is due to such cost items as dismantling, tearing down, remounting, loss due to service interruptions, loss due to overtime and wasted-time expenses caused by irregularities, and so forth. For the case in point, the gross depreciation annuity of the wood pole line amounts to a replacement cost of from £3 to £4 per mile *plus* that amount resulting from the total number of poles and struts per mile *multiplied* into the depreciation annuity mentioned above—this item of cost amounts to approximately £6 per mile of line.

The operating expenses for the wood pole line are around £4 10s. per mile of line, as against £2 16s. per mile of steel pole line.

Included in the first cost is 15% for insurance, depreciation on equipment, supervising, miscellaneous supplies, danger signs, superintendence, and unforeseen expenses. For all the lines, the writer took 5% as the capital interest.

In the place of stays, the writer chose wood struts (not sawn timber), three every two miles. The costs refer to a highway, and include double insulators for the greater part of poles, in each case. The concrete construction enjoys advantages for medium spans, i.e., for spans ranging from 400 to 850 ft. Medium-span construction comes nearest to the ideal, and reinforced concrete construction of any weight (light rural lines or double circuit main transmission power lines) is the best and cheapest for medium spans.

If the Editor can arrange for space, the writer will endeavour to find time to draw up a series of reinforced concrete pole designs for standard three-phase 3-wire lines suitable for operating at voltages from 3 300 to 33 000. Engineers desiring to compare the costs of their own wood or steel pole lines with the reinforced concrete pole line can thus have the opportunity of doing so.—I am, etc.,

London, July 15th. William T. Taylor.

"Researches in Circuit Breaking."

[To the Editor.]

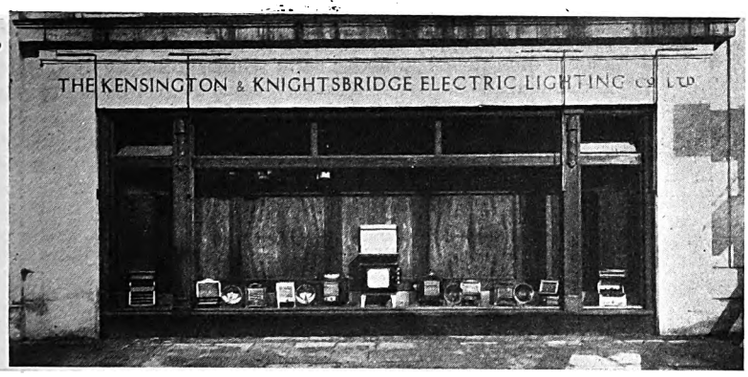
Sir,—When the Electrical Research Association paper on circuit breaking was read and discussed at Manchester, I remarked that the Association's method of estimating the electromagnetic force on a circuit-breaker crossbar was wrong in theory and misleading in practice. I was not contradicted at the time; but afterwards, in the "Journal" of the Institution of Electrical Engineers for May, 1929, the authors denied that the method in question was based on a wrong idea, and said that they still recommended it.

Yet I still contend that the method is wrong, and, in my opinion, may cause serious mistakes to be made by British manufacturers who adopt it.

The method recommended by the E.R.A. was described in "World Power," dated January, 1925. It is based on the idea that

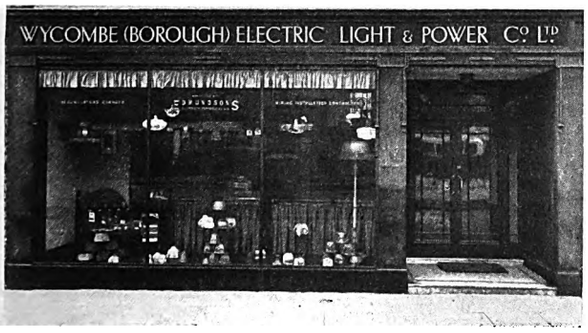
$$H = 2i/x^2,$$

where H is the magnetic intensity (equal to B/μ) at a perpendicular distance x from a long and straight conductor



THE importance of the shop-front in planning for increased trade in domestic electrical appliances was emphasised in an illustrated article in The Electrician *of July 5th. Here are three further illustrations of modern shop-front construction.*

In the first example (by E. Pollard and Co.) the front is in teak and the enclosure back is of Ancona walnut framed in teak. The plinth is faced with polished black Belgian granite. The two remaining illustrations are of fronts put in by S. Haskins and Bros., Ltd.

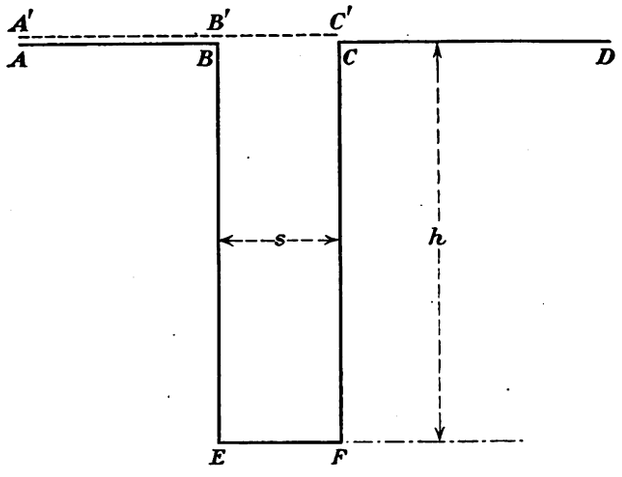


Digitized by Google

carrying a current i. But this idea must be wrong, for the dimensions of magnetic intensity are current/length, and a magnetic intensity therefore cannot be represented by an expression whose dimensions are current/(length)^2.

Actually, with the CGS electromagnetic units here referred to, the magnetic intensity varies from about i/x to about $2i/x$, according to the distance of the point in question from the middle of the conductor, it being assumed that the length of the conductor is many times as great as x. The mistake of putting x^2 in the denominator has caused the E.R.A. to give an incorrect rule for dealing with cases in which their method is employed with a drawing that is not full-size. If the scale of the drawing is 1/8, as is likely when we are dealing with a very large circuit breaker, the method represents the force as being about 1/8 of what it really is. And more than an hour's hard work would be required for arriving at this wrong result, whereas the right result can easily be arrived at by my method in two or three minutes.

For the proofs of the formulæ that are given below, I must refer the reader to my article in the "Journal of Scientific Instruments," dated November, 1927, or to the French translation that appeared in the "Revue Générale de l'Électricité," dated May 12, 1928. In those articles, the CGS electromagnetic units are adhered to throughout; but in what follows, the currents are in amperes and the forces in pounds. It will be seen that the length unit is immaterial, since the lengths occur only in the form of ratios.



If the vertical leads of the circuit breaker have a radius r, a length h, and a distance s between their axes, and if the current is I amperes, the electromagnetic force that these leads exert on the crossbar EF (see diagram) is a downward one of

$$4{\cdot}5\ (I/10\ 000)^2 \log_e \frac{2{\cdot}57\ s/r}{\sqrt{(s/h)^2+1}+1} \text{ pounds,}$$

each of them exerting half the force here indicated. This is an improvement upon the corresponding formula in my article; it embodies a more accurate evaluation of $2e^{\frac{1}{4}}$ (namely, 2·57 instead of 2·56), and a closer approximation to the value of dw/dh (where dw is the increase in the store of magnetic energy due to an increase of dh in the length of each vertical lead).

If the horizontal conductor AB or CD has a length m, the electromagnetic force that it exerts on the crossbar is an upward one of

$$2{\cdot}25\ (I/10\ 000)^2\left\{1+\sqrt{((m+s)/h)^2+1}-\sqrt{(m/h)^2+1}-\sqrt{(s/h)^2+1}\right\} \text{ pounds.}$$

If the horizontal conductor CD is replaced by one that takes the current in the opposite direction, as indicated by the dotted line $A'B'C'$, the part $A'B'$ will practically nullify the effect of AB, and the part $B'C'$ will exert on the crossbar a downward electromagnetic force of

$$4{\cdot}5\ (I/10\ 000)^2\left\{\sqrt{(s/h)^2+1}-1\right\} \text{ pounds.}$$

These formulæ give the instantaneous force when I is the instantaneous value of the current, and consequently give the average force when I is the root-mean-square value of the current. As a little consideration will show, they enable one to deal with any two conductors that are either parallel or perpendicular to each other.

Like previous writers on this subject, I have been assuming that there is no magnetic material in the path of the flux. The object of my article was to show that the fundamental case of conductors in a non-magnetic medium had not been satisfactorily dealt with. It may here be mentioned, however, that the usual iron tank of an oil circuit breaker will shield the crossbar from the flux that is due to the horizontal conductors outside the tank, and will thus make it unnecessary to allow for the presence of these conductors.—I am, etc.,

W. F. Dunton.

Manchester.

Electrical Development in London.

[To the Editor.]

Sir,—When one of the supply companies operating in one of the suburban districts of London, not more than eight miles from Charing Cross, offered its consumers a two-part tariff with a unit charge of 1d., some of those who had previously been unable to make full use of electricity for domestic purposes were encouraged to believe that the new tariff would herald their electrical emancipation. That those hopes have not as yet been realised in at least one case will be seen from the following statement of facts.

Being desirous of installing an electric cooker, electric fires, and other domestic equipment, I informed the supply company of my requirements and asked what facilities they could offer in the form of hire or hire-purchase of cookers.

Instead of replying to my letter, the company sent a representative at a time which a moment's thought would have shown that I would be engaged at my work. My wife had the task of interviewing the representative, and as a result, it was reported to me on my return that no hire or hire-purchase facilities were afforded for cookers, and that in any case they could not consent to the installation of apparatus with a maximum load higher than 3 kW, which meant that if I wanted to have the food for my family of five (not allowing for visitors) cooked electrically, it must be done—presumably in relays—in a cooker of the "baby" class.

This may be a small matter to the supply company, but even in my small flat, they have waiting for them a load of at least 10 kW, which they are not prepared to take. As there must be many similar cases in the neighbourhood, there is a substantial load going begging which would certainly justify some sort of effort to acquire. It was gathered from the conversation with the company's representative that new mains would have to be put in—someday. In the meantime, the local gas company retains, for a further indefinite period, at least, one very reluctant user of a gas cooker.

Incidentally, it is surprising that a company which is not prepared to supply much beyond mere lighting requirements should offer its consumers a tariff which, while giving the latter a financial advantage on lighting, seems to give no corresponding advantage to the company.—I am, etc.,

A Mere Consumer.

London, S.E.26.
July 17th.

POINTS OF VIEW.

There is no animosity against British products.—*Mr. William T. Cosgrave.*

* * *

The telegraph is not itself a dying industry, but a growing one.—*Mr. James J. Tyrrell.*

* * *

The day is far past when you can leave your wares, however good they are, to sell themselves.—*Sir Ernest Petter.*

* * *

However optimistic I may have been in the past, I feel even more optimistic to-day as to the future of the electrical industry.—*Mr M. J. Railing.*

* * *

There is undoubtedly a growing consciousness on the part of school authorities that some training in matters electrical should be given to girls during their school life.—*Miss C. Haslett.*

* * *

The lower costs due to rationalisation means lower prices to meet competition for orders at home and abroad. They have a two-fold effect: they lower prices to the user or consumer and so possibly bring about a larger demand.—*Sir George Sutton.*

NEWS IN BRIEF.

Wimbledon and Domestic Appliances—Electric Heating at Gravesend—The Marking of Permanent Magnets—The Engineers' Club again on Fire.

STEPS are being taken to arrange an electrical exhibition at Briercliffe, Lancs.

Shipley Electricity Committee recommends the Council to purchase showroom premises in Westgate, Shipley, for £1 800.

Wakefield Electricity Committee has authorised the installation of power plugs at Council houses where tenants guarantee a small minimum payment.

Middlesex County Council has decided to duplicate the electrical apparatus at the Clare Hall Sanatorium sewage works, at a cost of about £150.

Bingley U.D.C. requires an assistant to the Electrical Engineer.

Barking U.D.C. requires a mains superintendent and an assistant rotary sub-station attendant.

Whitby U.D.C. has received sanction to a loan of £1 500 for the construction of electricity showrooms.

The City of London Corporation is about to electrify the goods lift at the Guildhall School of Music, at a cost of £135.

The Rev. Edward S. Woods, Vicar of Croydon, is raising funds for the improvement of the electric lighting of the old parish church.

Wimbledon Electricity Committee is to seek sanction to the borrowing of a further £15 000 for the purchase of domestic electrical apparatus for hire.

Gravesend Town Hall Committee recommends a system of electric heating for the municipal offices, at a cost estimated at £436. The Electrical Engineer is to obtain tenders.

The Post Office submarine telephone cable between Lancashire and Co. Down was put into operation on Monday. Calls were made to London immediately.

Mr. Montague Williams, who has acquired the pier at Exmouth, intends to transform it into an amusement place. Among other attractions will be electric auto-scooter cars.

Dumfries T.C. has decided to fix the wages and conditions of engine room attendants and the assistant engineer at the electricity works in accordance with the terms of the National Joint Board for Electricity Undertakings.

The new Reliance telephone exchange, Walworth Road—the 12th automatic telephone exchange in the London area—was opened on July 11th. It is expected that 10 more automatic exchanges will be opened in the London area before the end of the year.

The Engineers' Club, London, which was damaged by fire a few weeks ago, was the scene of another fire on July 11th. Last week's fire originated on the first floor, did considerable damage in the upper storeys, and destroyed much of the scaffolding, which had been in use in connection with repairs after the previous fire. See page 91.

The Standing Committee appointed by the Board of Trade will hold an inquiry at 10.30 a.m. on July 30th, as to whether the following classes and descriptions of goods should bear an indication of origin: engineers' rules of metal; steel measuring tapes; tuning forks; permanent magnets. The inquiry will be held at the Board of Trade Offices, Great George Street, London, S.W.1. Communications should be sent to the Secretary, Mr. E. W. Reardon, at that address.

The Institute of Transport announces that its tenth annual dinner will take place at the Hotel Cecil, London, on March 12th, 1930.

If the Preston all-electric house experiment proves satisfactory, the same type of house will be adopted in a Corporation housing scheme.

Brierfield U.D.C. has applied to the Electricity Commissioners for sanction to a loan of £5 000 for the construction of the sub-station at the town hall which is rendered necessary by the change over from d.c. to a.c.

A burgh electrical engineer and manager is required at Dumfries.

The Commissioners for the Port of Calcutta require an electrical engineer. Applications to Mr. J. Angus, 10, Princes Street, Westminster, S.W.1.

Walsall Corporation has passed plans for the provision of accommodation for electricity showrooms and offices at the old Borough Offices, Upper Bridge Street, at a cost of £4 407.

An electrician-mechanic is wanted by the Public Works Department of the Government of Nigeria. Applications to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1. (Reference M. 1 514.)

Rotherham Education Committee has appointed a special committee to consider the system of heating to be adopted in the new technical college and to visit schools and institutions where electric heating has been installed.

Plans for the construction of a canal and a number of hydro-electric stations from Bukharest to the Danube have been approved by experts of the Rumanian Ministry of Communications. The scheme will cost about £3 650 000.

Interesting items at the exhibition of engineering models and apparatus on the occasion of the recent conversazione of the Institution of Civil Engineers included a model of a 132 000 V sub-station now being constructed by the Central Electricity Board; and a wireless beacon transmitting panel and a master clock for automatically controlling the times of signals, shown by the Elder Brethren of Trinity House.

Newcastle-upon-Tyne Corporation has passed a resolution to the effect that the present state of the law with regard to the testing and certification of electric meters is defective, and that the Corporation urges upon the Government the need for legislation requiring the certification and stamping of meters. The Electricity Commissioners are in communication with the Corporation with a view to ascertaining in what respects it regards the present state of the law as being defective.

The Judicial Committee of the Privy Council has dismissed, with costs, the appeal of Mr. Benjamin F. Groat, against judgments of the Trial Court and the Appellate Division of the Supreme Court of Ontario to the effect that the appellant's patent No. 189 369, dated April 1st, 1919, for a method of controlling surface water and other fluids with a view to the prevention of rivers, etc., becoming clogged with ice or other substances had not been infringed by the Hydro-Electric Power Commission of Ontario.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN, *dated July 19th, 1879, recorded that:*

The Eastern Telegraph Co. built a small vessel—the "Retriever"—for repairing the 82 shore ends of cables on its system.

Various novelties, including a patent fluid-filled Johnson and Phillips insulator, were shown at the conversazione of the Society of Telegraph Engineers.

A correspondent in America reported that during a visit to Menlo Park, Mr. Edison "exhibited the standard with the spiral of platinum at the top, which, for want of a better name, he calls a lamp." The high price of platinum for the "incandescent coil" was said to be an obstacle to practical success.

* * *

TWENTY-FIVE years ago it was reported in THE ELECTRICIAN *of July 22nd, 1904, that:*

The text was issued of the Bill "To provide for the Regulation of Wireless Telegraphy."

Bournemouth Lighting Committee declined to consider ratepayers' demands for the adoption of public electric lighting on Sundays.

Thieves who stole a quantity of cable from W. T. Glover's works put it on a fire so that the copper might be more readily available. Unfortunately for them the cable was of a fireproof type, and was abandoned in a sooty, but otherwise undamaged, condition.

* * *

TEN years ago, according to THE ELECTRICIAN *for July 18th, 1919:*

The new Household Fuel and Lighting Order permitted an annual consumption up to 1 600 kWh without certificate from the local Fuel Overseer.

Many "peace" illumination schemes had to be abandoned on account of the E.T.U. demand for a special rate of 2s. 6d. an hour plus a bonus of 12½% for such work.

PERSONAL.

GELLYGAER U.D.C. has accepted the resignation of Mr. H. McNaul, electrical engineer and manager.

Mr. R. S. Wright has been elected to serve on the Council of the British Institute of Radiology for the 1929-30 session.

The offices of Mr. E. G. Okell, city electrical engineer, Plymouth, have been transferred to Armada Street, Plymouth.

Mr. J. W. Ellison has been appointed senior charge engineer at Newry power station, with Mr. E. Hillen as second in charge.

Bolton T.C. has increased the salary of Mr. H. Makin, buyer and salesman in the electrical fittings department, from £350 to £375.

Mr. G. A. Featherstone, Mr. Wm. Lee and Mr. J. Russell Knowles have recently been elected to the Board of Silvertown Lubricants, Ltd.

Mr. G. G. Eaglesome, late executive engineer of Babcock and Wilcox, Ltd., has been appointed joint managing director of Kiesselbach Steam Accumulators.

Mr. R. Lee, electrical engineer at St. Helens, who is leaving to take up a similar position at Stockport, has been presented by the staff and employees with a mahogany timepiece.

Estate of the gross value of £8 375, with net personalty £8 336, was left by the late Mr. Roland R. Marshall, who was for 20 years chief electrical engineer to Ayr Corporation.

Mr. Leslie Spencer Gould, eldest son of Mr. Charles Gould, electrical engineer at the First Garden City, Letchworth, has passed his B.Sc. Examination with honours in electrical subjects.

Mr. W. S. Johnston, manager of the Dumfries electricity works, has been appointed borough electrical engineer and manager at St. Helens at a salary of £800 per annum, rising in four years to £1 000.

The marriage of Mr. Joseph F. Drage, electrical engineer at the Kemsley Paper Mills, Sittingbourne, and Miss Edith Mary Allison Webb was solemnised at St. Michael's Church, Sittingbourne, on June 24th.

Mr. Alan D. Maclean has resigned his position as chief assistant engineer of the Yorkshire Electric Power Co. in order to take up the position of general sales manager to International Combustion, Ltd.

Messrs. H. Walkington and H. A. Webb have been appointed works manager and assistant works manager, respectively, of S. G. Brown, Ltd., while Mr. H. C. Goodman has accepted the position of home sales manager.

Darlington T.C. has stabilised the salary of the borough electrical engineer, Mr. J. R. P. Lunn, at £1 500 per annum for the three years ending March 31st, 1931, and at £1 600 for the four years ending March 31st, 1935.

Sir Felix J. C. Pole has been elected a director of the British Thomson-Houston Co., Ltd. He recently resigned the post of general manager of the Great Western Railway to become chairman of Associated Electrical Industries.

Lieut. Lancelot E. C. M. Perowne, R.E., who was recently appointed adjutant of the Tyne Electrical Engineers, has been given the rank of captain in the Territorial Army while so employed and seconded in the Royal Engineers.

Mr. A. A. Campbell Swinton, F.R.S., a director of W. T. Henley's Telegraph Works Co., Ltd., and other companies, who has been ill for some time, has now been able to leave his room, and it is hoped that he may soon resume his usual activities.

With reference to the paragraph on page 55 of our last issue, concerning the impending appointment of Mr. Railing to the position of joint managing director of the General Electric Co., Mr. Railing's initials are, of course, M. J., and not A. J. as printed.

The marriage of Mr. Kenneth Leslie Theobald, who is engaged in the research department of the radio station at Rugby, and Miss Mabel Mary Betts, was solemnised on June 22nd, at Colchester. Mr. Theobald was formerly on the staff of Marconi's Wireless Telegraph Co., at Chelmsford.

The marriage of Mr. Alan Victor Sowman, assistant manager of the Manchester branch of Crompton Parkinson, Ltd., and their representative in the Liverpool district, and Miss Winifred Thwaites, who was on the Chelmsford staff of the firm, was solemnised at St. Mary's Church, Broomfield, Chelmsford, on June 28th.

The Board of Directors of the Marconi International Marine Communication Co. has appointed Marchese G. Marconi president of the company. The Rt. Hon. F. G. Kellaway has been appointed chairman in the place of Marchese Marconi. Mr. Kellaway will retain the office of managing director.

Sir George Croydon Marks, of the firm of Marks and Clerk, consulting engineers and patent agents, who was a Liberal M.P. from 1906 to 1924, has been raised to the Peerage. Sir George, who recently announced his intention to support the present Labour Government, has decided to adopt the title of Baron Marks of Woolwich.

Three new Beit Fellowships for Scientific Research, of the value of £250 a year for two years, have just been awarded, and amongst the three Fellows who were elected a year ago, and whose awards have been confirmed for a second year, is Mr. E. C. S. Megaw, whose Fellowship was awarded for electrical engineering research.

Six colleagues wearing rubber insulating gloves and supporting transmission lines bearing zinc plates on which were the words printed in bold red letters, "Danger, 33 000 volts," formed a guard of honour at the wedding on July 11th of Mr. Albert Strong, assistant mains engineer for Leicestershire and Warwickshire Electric Power Co.

Mr. A. S. Clarke, assistant sales manager of the North Metropolitan Electric Power Supply Co., who is leaving the company's Enfield undertaking to take up a position as distribution engineer with the Burma Electric Supply Co., was, last week, presented with a case of pipes by the members of the Enfield staff. He sails for Burma on October 4th.

Sir Richard Threlfall has been presented with the medal of the Society of Chemical Industry. Sir Richard was formerly Professor of Physics at Sydney University. Since his association in 1889 with a firm of phosphorus manufacturers of Birmingham he has directed his attention to the application of engineering, especially electrical engineering, to chemical manufacture.

Worcester Electricity Committee recommended that the salary of the electrical engineer, Mr. C. M. Shaw, be increased, by £150 a year to £1 150, on the understanding that he undertook the duties of development officer. The Council, however, has deferred the matter until the presentation of the city budget at the end of the financial year. Mr. Shaw has been appointed development officer at a salary of £50 a year.

The Establishment Committee of Hackney (London) B.C. recommends that Mr. J. W. London be appointed showroom manager in the electricity department at a salary which, under the National Joint Board schedule, amounts, at present, to £297 17s. per annum, and that Mr. E. Brown be appointed sales manager. Mr. London and Mr. Brown have already occupied the positions referred to during a probationary period.

Mr. James Witter, superintendent of installations, Liverpool electricity department, has retired on superannuation. As the result, Mr. T. L. Bowler, assistant superintendent of installations, is appointed superintendent of installations; Mr. Sidney Wellington Hillsdon, wireman, is appointed assistant superintendent of installations; Mr. A. E. Aird is appointed electrical installation engineer; and Mr. R. C. Burton assistant to the electrical engineer.

Mr. Geo. W. Essex, previously assistant secretary, has been appointed assistant general secretary of the E.P.E.A., in succession to Mr. J. W. Thomas. Mr. J. F. Wallace, previously regional secretary, is now an assistant secretary, and his field of operation has been extended to include, in addition to Scotland, the North of England, North Wales and Ireland. Mr. Geo. E. Love has been appointed an additional assistant secretary to operate in the Midlands, South of England (including London) and South Wales.

The Kelvin Medal for 1929 has been awarded to M. André Blondel (France). He has been engineer of the Ponts et Chaussées since 1889, and also for many years the chief engineer of the light house services, and he is distinguished by his work on signalling apparatus, optical and electrical, and particularly for his investigations in connection with electrical measuring apparatus and photometry. In 1913 he became a member of l'Académie des Sciences, and in 1923 was appointed Inspecteur-Général des Ponts et Chaussées. Other recipients of the Kelvin Medal have been Dr. W. C. Unwin, F.R.S., Prof. Elihu Thomson, and Sir Charles Parsons.

OBITUARY.

MR. GEORGE JAMES DUNKLEY, at Manchester on July 10th, aged 56 years. Mr. Dunkley was a much esteemed representative of the Insulating Varnish Department of Pinchin, Johnson and Co., Ltd., in whose employ he was from 1917 to the time of his decease. He was for some time works manager of Micanite and Insulators, Ltd., and also served as foreman of the Mica Department of the British Westinghouse Co., Ltd., from 1905 to 1917.

OVERSEAS TRADE.

Electrical Exports for Six Months Exceed Imports by £5 894 582.

UNITED Kingdom exports of electrical machinery, apparatus and material during June last amounted to £1 383 752, as against £1 574 951 for the same month last year. The decline by comparison was £191 199. Electrical exports for the six months January to June, 1929, amounted to £9 357 587, or £19 922 less than for the corresponding period of last year. Imports of similar goods during June, 1929, amounted to £622 148, compared with £474 604 during June, 1928, and for the six months of this year and last year the totals were £3 463 005 and £2 965 404, increase £497 601.

These figures indicate that June exports were £761 604 in excess of imports during the same month, and during the six months January to June electrical exports were in excess of imports by £5 894 582.

Export items which showed improvement during June when compared with the same month last year were telegraph and telephone wires and cables other than submarine, increase £35 600; electric carbons, increase £1 791; electric glow lamps, £3 110; and various electrical goods and apparatus, £16 157. Exports of railway and tramway motors, on the other hand, decreased by £27 987, motors and generators by £37 281; and other machinery by £57 097.

The item which showed the biggest increase on the import side was telegraph and telephone instruments and apparatus, the increase being £76 164. The following are detailed figures:—

	Month of June.		Six months,

OVERHEAD LINES.

Association's Interesting and Comprehensive Tour of the Mid-Cheshire Area.

THE Overhead Lines Association paid a visit to the Mid-Cheshire area on July 5th, when, starting from Winsford, members inspected the bulk supply switching and sub-station for Winsford and Gravel Farm adjoining the Winsford railway station, which is at the point of junction between the Runcorn-Crewe line and the Mid-Cheshire system. There is a similar switching junction point at Hartford, one being a standby to the other. The sub-station contains 33 kV Ferguson, Pailin drop down gear and metering gear, also 3·3 kV Metro-Vick cubicle gear and open switchboard for supply to Winsford and the country line. There is outside one U.A. outdoor switch, also air break switches and fuses and "English Electric" transformers.

Lines in Erection.

The party left Gravel Farm by charabanc and proceeded down Station Road through Winsford. At the extreme end of the suburb of Over a steel pole single-phase rural line, 640 ft. span, with 3 300 V copper-steel conductors, was seen in the course of erection. The route passed through the beautiful Whitegate area, one of the several rural districts developed on the single-phase 3 300 V system, and the lines were pointed out in several places along this route, the special arrangement of conductors and patent guard bridging the earthed return, and the earth wire being noted. The party continued its tour via Sandiway Golf Course, Sandiway, the Blue Cap Hotel to Kennel Wood, where spruce timber dealt with by Cobra process was inspected, followed by a call at the 10 H.P. booster station. Proceeding along Chester Road to Delamere, and the village of Norley, compound lines and patent guarding of 3 300/220 V, avoiding duplication of poles and allowing of heavy consuming devices were examined. Points of special interest were the inconspicuous entry for overhead service to Norley Church and cheap crossings over Post Office lines, using Pernax P.B.J. at 3 300 V. The Delamere Housing Estate, Ruloe and Upper Cuddington, represent electrical development in beautiful surroundings, all farms and cottages having been wired for the tenants by the owner, Major Wilbraham.

The tourists then made their way by Hefferston Grange Sanatorium, stopped to view the native poles from Kennel Wood, "Cobra" treated for the 3 300 V line now being erected to supply these premises and Acton Village, to Weaverham village, developed by the Weaverham Company in 1913, and left much as it was then. Of special interest was a comparison of the thin poles and present practice indicating the advance in style since that date. The party then proceeded through the village to Owley Wood, Brunner Mond and Co.'s Housing Estate, glanced at the sub-single phase underground development in three circuits, and then down Weaver Valley to Wallerscote, noting on the way the Northwich step down sub-station, 33 kV to 3·3 and 6·6 kV heavy three circuit line. Brunner Mond and Co.'s new works extension, and research laboratory were also seen. Passing through Davenham on the way back to Winsford of special interest was the chimney distribution, avoiding frequent service lines.

Proposing the toast of "The Overhead Lines Association" during the tea interval at Northwich, Mr. ROBERT BLACKMORE, until recently chief of the Stalybridge, Hyde, Mossley and Dukinfield Joint Electricity Board, said the Central Board's scheme depended for its success upon the growth and development of cheap distribution, and it looked to the O.L.A. for support.

Mr. W. FENNELL, general manager of the Mid-Cheshire Electricity Supply Company, and president of the O.L.A. referring to subsidies, said the Government might pay half the cost to lay cables underground, but he did not think they would. When it came to touching their pockets they would be careful, and it could be avoided by the extensive use of overhead lines.

Mr. THEODORE STEVENS, hon. secretary of the O.L.A., said the 1926 Act did not fully serve in the development of the rural areas, and 50% of London and 90% of some cities, which ought to come before the inter-connecting of great power stations. He advised the O.L.A. to push for the "grid" to be used to supply current to rural and other areas not at present served, and for the development of the load for the good of the people.

LEGAL INTELLIGENCE.

Continued Hearing of Case with Respect to Barton Power Station.

IN the House of Lords this week, Viscounts Dunedin and Sumner and Lord Blanesburgh continued the hearing of the appeal of the Lord Mayor and Corporation of Manchester, which arose out of a claim by Mr. Arthur Farnworth for damages and for an injunction to restrain the Corporation from committing a nuisance by their power station at Barton-upon-Irwell, in the County of Lancaster.

Last week their lordships intimated that they did not desire to hear further evidence on the question of the construction of the Acts, and Mr. Cyril Atkinson, K.C., counsel for the Corporation, addressed himself to the question whether or not the nuisance was inevitable or was avoidable.

He quoted the evidence of engineering witnesses to show that the generating station represented the best modern practice in design, and was considerably in advance of any other station in the country for efficient generation of electricity; that from the point of view of sulphur content the Corporation was using the best class of coal reasonably available, and that the substitution of a single chimney stack for the existing group of lower chimneys was impracticable.

Mr. W. E. Tyldesley Jones, K.C., following on the same side, said the effect of the indictment was so serious in respect of this generating station, on which the supply of Manchester and a large industrial area depended, that he thought it necessary to make additional observations. There was no dispute that the Corporation had committed a nuisance and no dispute that this was a most efficient station with nothing unusual about it. The builders of the station when they constructed it had not in mind damages by fumes, and similar damage was not known elsewhere from generating stations. The evidence of the Corporation's experts was that they could think of nothing to improve matters. On the other side there were affirmative suggestions by Dr. Travers, negatived by the Corporation witnesses, that certain matters might avoid or lessen the damage. Dr. Travers advocated higher speed in the ejection of gases, higher chimneys above the roof, and the absence of clusters of chimneys. The defendants, who relied on statutory powers, said not that the nuisance was inevitable, but that it could not have been avoided by any reasonable or practical precautions that up-to-date science or experience would suggest, and he contended that precautions were only reasonable or practicable if they were consistent with the carrying out of the purpose for which the statutory powers were given.

Mr. Singleton, K.C., appeared for the respondent, and on Tuesday their Lordships reserved judgment after shortly discussing with counsel the form the injunction should take in the event of their deciding against the Corporation.

Appeal on Alleged Infringement.

In the Court of Appeal before the Master of the Rolls, Lord Justice Lawrence and Lord Justice Russell, the hearing was concluded on July 12th of the appeal of the Lektophone Corporation of Jersey City, U.S.A., from a judgment of Mr. Justice Tomlin in the Chancery Division in their action against S. G. Brown, Ltd., of Victoria Road, Willesden Lane, N.W., to restrain an alleged infringement of the plaintiffs' patent, granted in 1914, for an invention by Marcus Clarence Hopkins.

The invention related to "improvements in sound-regenerating machines," and the plaintiffs complained that the Brown "Mascot" loud speaker was an infringement of the patent. Respondents, denying infringement, contended that the Mascot was merely an enlargement of the telephone receiver which was referred to in an earlier specification by Mr. Sidney George Brown, managing director of the respondent company. Mr. Justice Tomlin dismissed both the action and a counterclaim for revocation.

Sir Duncan Kerly, K.C., for the respondents, now intimated that as the plaintiffs' patent expired in the course of a few days respondents were not persisting in their cross-appeal regarding the counterclaim.

The first point argued by Mr. Trevor Watson, for the appellants, was as to the construction of the documents. The question, he said, was whether or not the Hopkins' specification was limited to gramophones. Mr. Justice Tomlin had found that it was so limited, but counsel's contention was that was an erroneous interpretation of the specification and that the invention was extended to loud speakers.

The Master of the Rolls: "It seems to me that we have got to take the language as used."

Sir Duncan submitted that the proper way to construe the document was to say that it did not describe the application of the Hopkins invention as extending to anything other than the stylus machines. It was true at the time of the invention that there was one other sound regenerating machine—the telephone—but nobody suggested how one could use a diaphragm such as described in the Hopkins specification with the telephone.

It was quite true that with the loud speaker such a diaphragm could be used, but between 1913 and the date of the Mascot loud speaker there intervened an invention by Mr. Brown which, counsel suggested, referred to the problem. Until the introduction of the amplifying device which enabled telephone current to be employed so as to get power to any extent, there was no further scope for Hopkins' invention, assuming that it was an invention.

The Court had to consider the document in the light of the surrounding circumstances of its day. Mr. Justice Tomlin had found that the post-Hopkins problem—the problem of the loud speaker for broadcasting—was a different problem altogether. What happened when the loud speakers came on the market was that everybody thought of the cone without any reference, suggested counsel, to Hopkins at all.

Hopkins' invention had not been heard of in this country. But when there were already loud speakers of various kinds, different in design from the Hopkins diaphragm, the patentee arrived and began to collect tolls from everybody, alleging that he had a patent which covered all cone loud speakers.

The Court gave judgment on the point of construction in favour of the respondents.

The Master of the Rolls, in his judgment, said it was admitted that the alleged infringement could not be claimed if the patent related to particular machines with particular characteristics, as indeed Mr. Justice Tomlin had found it did so relate.

The specification dealt with two inventions, one being for an instrument to reproduce sounds and the other being the mode of transmission. Taking the two claims side by side, and bearing in mind they were separate claims referring to separate inventions, one found in the first reference to machines that had the characteristics of the stylus and record machines, while the second claim had relation to the transmission and vibrations of the stylus.

Looking at the two documents, both of them indicated and referred to the vibrations that were initiated by the stylus.

The Court was satisfied that Mr. Justice Tomlin's interpretation of the Hopkins specification was correct. That being so, he was right in dismissing the action, and it followed that the appeal failed.

Lord Justice Lawrence and Lord Justice Russell concurred, and the action was dismissed with costs and the counterclaim without costs.

IN PARLIAMENT.

Points from Recent Replies to Questions in the House of Commons.

THE Postmaster-General (Mr. Lees Smith) is aware that complaints are made from time to time by telephone subscribers of harsh treatment with regard to unpaid accounts. Over a million accounts are dealt with each quarter, and he is afraid it would be impracticable to inquire as to the cause of non-payment in individual cases. If a subscriber's absence from home is known, special consideration is given to the case.

In reference to a suggestion that free wireless licences should be granted to all incurably infirm persons, Mr. S. P. Viant (Assistant Postmaster-General) states that the Broadcasting Committee, 1925, recommended that this concession be made to blind persons only, and he does not consider he would be justified in asking Parliament to extend it to other classes of the community.

The Government are fully alive to the importance and urgency of the problem of London traffic, and are ready to explore it with all the interests concerned.

The local authority concerned has agreed to the erection of an overhead line through Poynton. The scheme of the Trent Valley Electricity Co. was the subject of a Ministry of Transport inquiry last week.

A temporary manual telephone exchange is being equipped to serve the Romiley area, pending the provision of an automatic exchange. The latter will form part of a large scheme for automatic working in the Manchester area.

THE SOCIAL SIDE.

ON June 29th, the employees of the L.P.S. Electrical Co., Ltd., journeyed by road to Hastings on the occasion of the annual summer outing, where a most enjoyable day was spent. Lunch was provided by the managing director, who presided at the gathering.

S. Rogers and Co., Ltd., electrical contractors, 15, Fitzroy Street, W.1, held their second annual outing on June 29th, when a party of 37 visited Margate. The journey was made by train, and luncheon and tea were provided by the Nayland Rock Hotel. After a most enjoyable day, the party arrived back in London at about 11 p.m.

The fifth annual sports and gala of Johnson and Phillips, Ltd., were held on July 6th on the works sports ground at Kidbrooke. Although the weather was doubtful, a large crowd of employees and their families and friends came and saw several of the firm's " records " lowered, and to enjoy the long and varied programme, which included track and field events. Sideshows were this year an additional attraction, and music was provided by the band of Callender's Cable Works. The prizes were presented to the winners of the events by Mrs. Macgregor.

Three G.E.C. championships were decided on the Wembley sports ground on June 29th. The cricket challenge cup, presented by Sir Hugo Hirst for competition by the London establishments of the G.E.C., was won by Union Works, Wembley, who defeated Watson's Works. The tennis finals for challenge cups, presented by Mr. C. Wilson and Mr. E. G. Byng, were also played off on the hard courts at Wembley. The " Wilson " cup for gentlemen of the London establishments was secured by the team representing the Osram Lamp Works, who beat the Magnet House head office team. The Magnet House head office ladies' team, however, secured their revenge in the " Byng " Cup competition for ladies of the various London establishments, as they were successful in wresting the trophy from the Fraser and Chalmers ladies' team who had held it for the past two years.

The annual athletic meeting of the Crompton Parkinson Sports Club was held on July 6th, at the company's Wood Street Ground, Chelmsford. There was a record attendance, and some extremely good times were recorded in several of the events. Chelmsford beat Guiseley in the new competition for a tennis championship cup presented by Mr. Frank Parkinson, the managing director. There was great enthusiasm when Colonel Crompton, who founded the company 51 years ago, appeared on the platform, and in a happy little speech proposed a vote of thanks to Mrs. Claude Hardie, who presented the prizes. The " Guvnor," as he is called, spent the morning at the Chelmsford works, inspecting modern examples of electrical plant and renewing acquaintances with old friends. During the afternoon he met Mr. E. A. Pochin, who many years ago designed the Crompton-Pochin arc lamp. During the meeting a programme of music was given by the Crompton Parkinson Silver Band, under the direction of the conductor, Mr. Walter Hall.

BUSINESS ITEMS.

MR. J. D. WILLIAMS, wireless dealer, of 65, Cardiff Street, Aberdare, has opened a branch business at 72, Pontmorlais, Merthyr Tydfil.

The date now fixed for the opening of the Bucharest Radio Exhibition, which will include household electrical appliances, is September 1st, and the closing date, September 20th.

An Auckland (N.Z.) agent wishes to represent British manufacturers of domestic and electrical appliances, on a commission consignment or purchase basis. Further information from the Department of Overseas Trade. (Reference No. 540.)

A firm of commission agents in Aleppo, Syria, with branches in Beirut and Haifa, desires to obtain the representation of British manufacturers of electrical apparatus and accessories, especially wire. Particulars from the Department of Overseas Trade. (Reference No. 552)

The " Southern Cross," in both its flights, carried a wireless receiving set constructed by the NEW SYSTEM TELEPHONES PROPRIETARY, LTD. This set, equipped with Osram valves (viz., one S.215, two DEL.410 and one DEP.410), had a wavelength range of from 18 to 2 700 metres, and " Gecophone " headphones were used. The aeroplane was also fitted with Osram lamps for illumination purposes. See page 91.

Park Royal Hospital has just been equipped with a specially designed " Marconiphone " wireless installation, incorporating 70 loudspeakers and 400 headphones, and in addition to radio programmes gramophone record recitals are possible by means of a pick-up. Services from the chapel and entertainments from the dining hall may be relayed by means of microphones, which are also used for urgent staff calls and general announcements. The equipment is one of the largest in London and, being on the unit system, can be extended when desired, if the necessity should arise.

The contracts awarded to the ALTON BATTERY CO., LTD., in January by the Australian Postmaster-General have been followed by a further Australian contract for batteries for Marouba, Box Hill, Oakleigh, Cottesloe Hurstville, Sale and Freemantle Telephone Exchanges. In addition, batteries of C.E.M.F. cells are to be supplied for Box Hill, Oakleigh, Semaphore and Cottesloe Telephone Exchanges. The batteries range in capacity from 181 to 1 015 Ah. A further repeat order from Canada for an Alton battery of 4 630 Ah capacity has also been received.

BIRMINGHAM ELECTRIC FURNACES, LTD., inform us that they have received an order from David Brown and Sons (Huddersfield), Ltd., for a furnace having a usable hearth 14 ft. long by 3 ft. 3 in. wide, with a maximum rating of approximately 200 kW. This furnace is double-ended and will be used for reheating and carburising. It is believed that this will be the largest electric furnace for this purpose in the country. In addition, Messrs. David Brown and Sons have already four electric furnaces in operation for heat treatment purposes, three of which were supplied by Birmingham Electric Furnaces, Ltd.

ELECTRICAL "socials" have again been prominent, and of the many and varied snapshots we have received, two are reproduced above. That on the left was taken at the Crompton Parkinson Sports and includes, right to left, Mrs. Parkinson and Mrs. Hardie. The right hand photograph shows one of the four special trains which were recently employed to take a portion of the Ferranti staff to Blackpool and London respectively, on the occasion of their annual day's outing. The view shows one of the L.M.S. trains arriving at Hollinwood station, and faintly in the background can be seen the chimney and a small portion of the Hollinwood factory. This outing, which takes place every year, is a very popular feature, as will be realised by the fact that each train was so long as to require two locomotives.

DOMESTIC FITTINGS AND APPLIANCES.

New Lighting Fitting Designs — Electrical Apparatus for Table Use — Diathermy Equipment—New Radio Lines.

DECORATIVE LIGHTING, LTD., in association with the Artistic Shade Co. and Cunningham Slater, Ltd., 146, Kensington High Street, London, W.8, produce large scale shades for cinemas, theatres and ballrooms. Most of the fittings are specially designed for each particular setting, while some of the smaller examples of shades on view in the showrooms, in conjunction with the photographs of installations, give a good idea of the beauty of the larger and more expensive models. The shades examined were hand painted with numerous kinds of design, some very elaborate, others quite simple. Captain Wynn Slater, who is largely responsible for this work, pays special attention to the appearance of the shades in daylight—a good policy, for it must be admitted that fittings which look delightful when illuminated can, if care is not taken, appear ugly during the day. He also endeavours to produce shading devices which will be in harmony with the atmosphere of any individual room, large or small; i.e., gaiety for ballrooms, cosiness for boudoirs, and repose for libraries. As an example of the work of the firm one may cite the relighting of the Elite Picture House at Middlesbrough. The basic scheme on which the designer went to work was Wedgwood, and it has been stated by a daily paper that the beauty of the interior has been doubled, and that, despite the striking effects achieved, the illuminants are in harmony with the general interior. In the centre of the dome ceiling is a shade 14 ft. in diameter, and around it are six shades of different shape but similar design to the centre one. The other lighting is produced by shades which, though smaller, are said to be equally artistic, and made flush with the ceilings, so that the apparent height of the building may not be diminished. The footlights are subdued behind flowers, and at either side of the proscenium are illuminated vases. Wedgwood vases contain the wall lights. In the field of ballroom lighting the scheme installed at the Plaza, Glasgow, can well be mentioned. By a relatively simple system of wiring a fresh colour effect can, it is stated, be obtained for each dance every evening for a week, without repetition. Thus the most suitable colour for each type of dance can be switched on at will.

A new hot water jug by the Electric Heating Co.

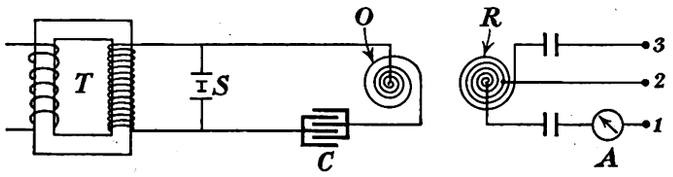
The ELECTRICAL EQUIPMENT AND CARBON CO., LTD., of Bank Buildings, 107-111, New Oxford Street, London, W.C.1, are marketing a light-weight, inexpensive vacuum cleaner, known as the "Carmenta." The machine is finished in polished aluminium and has a universal motor. It can of course be easily converted to a blower if desired.

The industrial lighting fitting, No. 54, of L. G. HAWKINS AND CO., LTD., 30, Drury Lane, London, W.C.2, has the special feature of a lower horizontal panel, which can be removed when the unrestricted light of the high-powered lamp is desired. This diffusing panel is circular and is secured in the base of the cylindrical fitting by slots, in such a way that it can be slipped out at will. The cylindrical bowl itself is of a somewhat novel design, and can be had either suspended by chains or as a ceiling type.

The ELECTRIC HEATING CO., of George Street, Croydon, has just put on the market an "Elect" water jug suitable for the tea and breakfast table. The capacity of the jug is 1¼ pints, and the loading is 400 W. The jug is constructed of stout metal upon which a heavy coating of nickel plate has been deposited. The handle is of heat resisting material covered with black and white cane.

During the present year interest has been aroused in diathermy treatment. The following particulars refer to the diathermy machines manufactured by the MEDICAL SUPPLY ASSOCIATION, LTD., of 167-185, Gray's Inn Road, London, W.C.1. The term "diathermy," meaning "through-heating," describes the physical effect of passing through the body a current of very high frequency. The current naturally generates heat all along its path, so that the tissues are heated throughout, thus producing "diathermy."

The apparatus used comprises step-up transformer, spark gaps, condenser and helixes. In the diagram reproduced on this page *T* is the transformer, *S* the spark gap, and *C* the condenser; the helix *O* is known as the oscillator, and the helix *R* the resonator. The resonator is so arranged that its position relative to the oscillator can be altered, the maximum diathermic effect being obtained when it is immediately over the oscillator. The person receiving treatment may be connected between terminals 1 and 2 or 1 and 3, which are coupled with the resonator through condensers. The ammeter *A* reads up to 3 000 milliamperes; the capacity of this apparatus is 6 500 milliamperes, but such heavy currents are only required in exceptional circumstances. The spark gap is of the Tungsten air type, which is stated to have an advantage over the gas type in that it requires no cleaning or adjustment. The instrument is finished in unscratchable cellulose lacquer, and is fitted with a white or grey marble panel. A safety cover protects the operator from accidental shocks; it is impossible to give treatment until the cover is in position, owing to the construction of the apparatus. A motor convertor is sold for use with the machine where no a.c. supply is available.



Illustrating the theoretical arrangement of the diathermy equipment of the Medical Supply Association.

A new ultra-violet ray lamp is the "Medi-Sun," also manufactured by the Medical Supply Association. This lamp is claimed to combine the giving of light containing a high percentage of violet rays with complete safety to the home user so long as the instructions are followed. The first claim can be verified in the showrooms, where a specially designed spectroscope is provided; this spectroscope also shows graphically how the "Medi-Sun" lamp and an ordinary luminous-ray therapeutic lamp may be used in combination to produce light, with whatever characteristics have been prescribed. Furthermore, a vita-glass filter can be used to cut off the ultra-violet rays below 2 900 Angström units. The lamp is of the quartz mercury vapour type, and takes normally 1½ A at 150 V. It can, however, be obtained in models adapted for supply circuits with pressures between 50 and 250 V. For d.c. the burner is of the two-pole type operated in series with a line resistance. The a.c. burner has three poles and is operated through a transformer, the connections being very similar to those of a mercury arc rectifier. The hood is free to rotate horizontally and vertically, and can be removed for packing; polished aluminium is employed, and the whole lamp has a strikingly attractive appearance.

The new "Hypermu" l.f. transformer.

The radio transformer, known as the "Hypermu," and manufactured by RADIO INSTRUMENTS, LTD., of 12a, Hyde Street, New Oxford Street, London, W.C.10, has two-

Digitized by Google

special features—the use of which is stated to be a new magnetic alloy of superpermeability, and a specially arranged magnetic circuit designed to give extreme but uniform amplification. It is claimed that the amplification may be made practically the same at 25 cycles as at 1 000 cycles, and this is supported by National Physical Laboratory curves showing the application of the transformer to two different circuits. Owing to the high permeability of the iron circuit, it has been found necessary to enclose the transformer completely with an iron shield. One of the holding-down sockets has the metal exposed so that the shield can be easily earthed. The transformer is enclosed in a bakelite moulding.

A particular advantage claimed for the "Hypermu" is that its design reduces to a minimum the possibility of breakdown due to the passage of anode current through the primary winding. The method of connection recommended also lessens the risk of breakdown and is said to make the chance of high amplitude distortion almost negligible. The overall amplification of this transformer is large enough for it to be connected directly following a detector valve and feeding into a super-power or pentode output valve.

The new Marconiphone Model 55 is a five-valve cabinet receiver marketed at a price which brings it into competition with the cheaper range of five-valve portables. The MARCONIPHONE CO., LTD., of 210-212, Tottenham Court Road, London, W.1, is full of confidence in its popularity, since it is considered to have many of the good features of the higher-priced models. The five Marconi valves comprise two stages of h.f., detector and two stages of l.f., and all valves are stated to be tested in each set before the instrument is sent out. The battery equipment consists of a 108 V h.t. battery, 9 V grid battery and 2 V 28 Ah unspillable accumulator. A single switch is provided for changing from long to medium wavebands and for switching off. The running and volume controls are of the usual edge-control Marconiphone pattern.

NEW I.E.E. SUB-CENTRE.

Hampshire Members Attend Inaugural Meeting at Portsmouth.

HAMPSHIRE members of the Institution of Electrical Engineers gathered at Portsmouth on June 27th to form a sub-centre of the Institution, and the inaugural meeting was held in the Lord Mayor's Banqueting Room at the Guildhall, where a civic welcome was given. The Lord Mayor (Coun. J. E. Smith), who is recovering from a recent illness, was represented by the Deputy Lord Mayor (Coun. Frank J. Privett), who had been asked by the Lord Mayor to extend a welcome on his behalf and on behalf of the citizens. The Deputy Lord Mayor also welcomed the President of the Institution and said he was very happy that the inaugural meeting was held in Portsmouth.

Col. K. Edgcumbe (President of the Institution) proposed a vote of thanks to the Deputy Lord Mayor for his welcome, and while regretting the absence of the Lord Mayor and more especially the cause of that absence, he thanked the Lord Mayor for allowing them to meet in that magnificent building. He believed it was the first occasion on which one of their centres or sub-centres had been "christened" in a Guildhall, with a Deputy Lord Mayor standing as sponsor.

Mr. B. Handley seconded the vote, and associated himself with the President's remarks.

Col. Edgcumbe then observed that the local centres formed an important part of the Institution, and he thought the members who lived in Hampshire and the Isle of Wight were to be congratulated on having taken the step to form a sub-centre. The Institution set great store by their centres as they enabled the Institution to model its policy in such a way as to meet the requirements of the different districts.

Mr. B. Handley was unanimously elected as the first Chairman of the sub-centre, and other offices were filled as follows:—Vice-Chairman, Mr. W. G. Turner; Hon. Secretary, Mr. S. Harcombe; Hon. Treasurer and Hon. Assistant Secretary, Mr. P. G. Spary; Ordinary Members of Committee: Mr. R. Ayton, Mr. E. L. Ingram, Mr. N. W. Prangnell, Mr. H. J. Grapes, Mr. J. F. McMullen, Prof. G. D. A. Parr, Prof. H. Stansfield, Mr. H. Martin, Mr. G. Shearing, Major C. F. D. Suggate, Sir V. L. Raven and Lieut.-Col. A. E. le Rossignol.

Col. Edgcumbe and Mr. P. F. Rowell were thanked for their attendance, and Mr. S. Harcombe was thanked for undertaking the preliminary secretarial work of the centre. Mr. Harcombe announced that the membership for the county was 251 and that over 200 of those members were in the Portsmouth and Southampton districts.

ELECTRICAL WOMEN.

Electrical Association for Women Holds Fourth Conference at Newcastle-on-Tyne.

THE fourth annual conference of the Electrical Association for Women was held at the North-East Coast Exhibition, Newcastle-on-Tyne. The members were received at an informal reception on Wednesday evening, July 10th, by the local officers of the Association.

The opening ceremony at the Festival Hall, North-East Coast Exhibition, was presided over by Mrs. Wilfrid Ashley, President; the Lady Mayoress of Newcastle (Mrs. Arthur W. Lambers) expressed the city's welcome to the delegates, and Miss Baxter Ellis brought the good wishes of the exhibition authorities.

Five delegates were present from overseas, and gave interesting speeches on "The Modern Development of Electricity as it Affects Women," in their respective countries.

Miss Sophia Malicki (U.S.A.) spoke mainly from the point of view of the women working in the industry, and Miss K. Bohm (Germany) spoke from the point of view of the trained engineer. Mrs. Van Waveren and Mrs. Muller-Lulofs (both of Holland) spoke on developments in Holland from the housewife's point of view, Mrs. Van Waveren confining her remarks to the rural districts, and Mrs. Muller-Lulofs to the towns, with particular reference to Amsterdam. Miss H. Norris (U.S.A.) brought greetings from the Women's Division of the Electric Association, Chicago. The Rt. Hon. Margaret Bondfield, M.P., has long taken an interest in the Association, and she had hoped to be present. Parliamentary duties, however, kept her in London, and a letter from Miss Bondfield was read by Dr. S. Z. de Ferranti, F.R.S.

The Luncheon.

The meeting was followed by a luncheon at the Grand Assembly Rooms, Barras Bridge, and among those attending were the Lord Mayor and Lady Mayoress, the Sheriff of Newcastle and Mrs. Allan. Mrs. Wilfrid Ashley presided, and proposed "The King." The toast, "Success to Newcastle and the North-East Coast Exhibition," was proposed by Lady Brooks, who has been three times Lady Mayoress of Birmingham. Lady Brooks referred to the exhibition as "an extraordinarily plucky effort to re-establish trade conditions." The Lord Mayor responded.

Mr. R. P. Sloan proposed "The E. A. W.," and specially mentioned "The Electrical Age for Women" as an "age" which one could always talk about, and a magazine which he always found most interesting. Mrs. Wilfrid Ashley responded.

In responding to the toast of "The Guests," proposed by Miss Balls, chairman of the North-East Coast branch of the E. A. W., Mr. L. L. Robinson, borough electrical engineer, Hackney, said he thought the Association might consider collecting the women's point of view on the question of electricity tariffs.

The opening day of the conference ended with a reception and dance in the Grand Assembly Rooms, given by the city, and attended not only by E. A. W. delegates, but by visitors from Arras and members of the British Legion.

On Friday morning, July 12th, the annual general meeting of the Association was held at the Exhibition, presided over by Mrs. Hammer, chairman of the Council, and the annual report was presented by the director, Miss C. Haslett. Mrs. Wilfrid Ashley was unanimously re-elected President, and the other officers elected were: Mrs. S. Z. de Ferranti and Mrs. Hammer as joint chairmen; Coun. Mrs. Gregory as vice-chairman; and Mrs. Ll. B. Atkinson as hon. treasurer.

Immediately after lunch the delegates divided into four parties, and visits were paid to the Lemington Glass Works, the Cremona Park Toffee Works, A. Reyrolle and Co., Ltd., and Seghill Colliery.

On Friday evening delegates were entertained to dinner by the North-East Coast branch of the E. A. W., and were received by Miss Balls, chairman, and the vice-presidents, Miss Sloan, Mrs. Norbert Merz and Miss Teresa Merz. Miss Balls presided, and once again the Association was honoured with the presence of the Lord Mayor, and Lady Mayoress, and the Sheriff and Mrs. Allan.

On Saturday afternoon the party were taken in private cars to Borcovicus, one of the finest Roman encampments in this country, and on Sunday visited the Farne Islands, an experience for which gratitude was expressed to Mr. Sloan and the Newcastle-on-Tyne Electric Supply Co.

The arrangements of the conference locally were carried out by Miss Anna Holm, local secretary, and her committee.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

KEIGHLEY INDUSTRIAL CO-OPERATIVE SOCIETY, LTD.—Electrical work in tailoring and gentlemen's outfitting department. Specification from the Secretary, 5, Brunswick Street, Keighley.

WEST RIDING EDUCATION AUTHORITY.—Electric lighting installation in head teacher's house at Ardsley (E. and W.) Blackgates Council School. Specifications from Mr. Percy Beaumont, West Riding Education Office, 8, St. John's North, Wakefield.

SALFORD CORPORATION, July 19th.—Sub-station and pit type, single-phase transformers. Specification from the City Electrical Engineer, Frederick Road, Salford.

Hospital Lighting Installation.

METROPOLITAN ASYLUMS BOARD, July 20th.—Alterations and additions to electric lighting installation at Grove Park Hospital, Lee, S.E.12. Specification, etc., from the Board's Office, Victoria Embankment, London, E.C.4; deposit £1.

CENTRAL ELECTRICITY BOARD, July 22nd.—Supply and erection of central indicators and telephones in connection with the Central Scotland Electricity Scheme. Specification (C.S.-S.S. 15) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

HINDLEY URBAN DISTRICT COUNCIL, July 23rd.—Erection of two electric motors and two centrifugal pumps at Strangeways pumping station. Specification from the Surveyor, Council Offices, Hindley; deposit £1 1s.

GAINSBOROUGH URBAN DISTRICT COUNCIL, July 24th.—Electric motors and pumps. Further particulars from Mr. S. W. Parker, waterworks engineer, Council Offices, Gainsborough; deposit £2 2s.

DOWN COUNTY REGINAL EDUCATION COMMITTEE, July 25th.—Electric light installation in Newcastle Technical School. Specifications, etc., from Mr. Castor J. Love, 5, Wellington Street, Belfast; deposit £1 1s.

EPPING GUARDIANS, July 25th.—Electric power installation, for laundry and well at the Institution. Specification from the Clerk, Union Offices, High Street, Epping; deposit £1 1s.

ABERTILLERY URBAN DISTRICT COUNCIL, July 26th.—Static transformer and low pressure switchgear for new central sub-station at Carlyle Street, Abertillery. Specifications from Mr. Dawson Thomas, engineer and manager, Electricity Offices, Abertillery, Mon.

HOUSE WIRING AT TORRY, July 26th.—Electrician's work of two houses at Balnagask Road, Torry, Aberdeen, for Mrs. W. Brebner and Mr. Alex Robb, respectively. Schedules, etc., from Mr. G. M. Hay, 177, Union Street, Aberdeen.

MANCHESTER CORPORATION, July 26th.—Manufacture, supply, and erection of a heavy oil engine and a c.c. generator at Partington gasworks. Specification, etc., from Mr. J. H. Sillitoe, Gas Department, Town Hall, Manchester.

CENTRAL ELECTRICITY BOARD, July 27th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Mid-East England Electricity Scheme. Specification (No. M.E.E.-P.L. 1), etc., from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, W.C.2; deposit £2 2s.

HARLOW (ESSEX) LIGHTING COMMITTEE, July 27th.—Lighting the district from September 20th, 1929, to April 30th, 1930, by electricity or by other means (57 lamps), and also one lamp at the "George," for 12 months. Further particulars from Mr. R. C. Cowlin, chairman of the Committee.

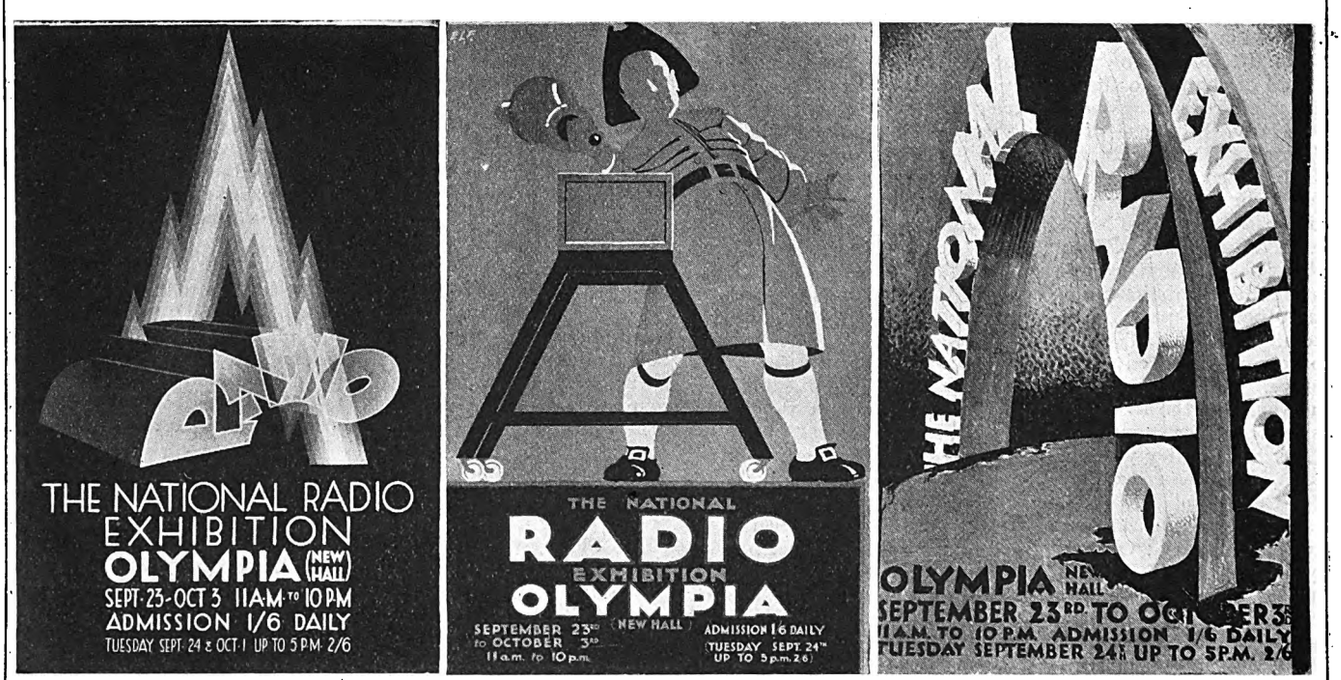
CARDIFF RURAL DISTRICT COUNCIL, July 29th.—Supply, etc., of sub-station equipment, underground cables, overhead lines, etc., in parish of Radyr. Forms of tender, etc., from Mr. R. Howard Fletcher, 3, Park Place, Cardiff.

Housing Scheme Contract.

DUNDEE CORPORATION, July 30th.—Electric light installation in connection with Fleming Trust housing scheme. Particulars from Mr. G. Baxter, 91, Commercial Street, Dundee.

MANCHESTER GUARDIANS, July 30th.—Circulating pumps and electric cable, at Crumpsall Institution. Specification from Superintendent of Works, Union Offices, All Saints', Manchester.

COMMISSIONERS OF H.M. WORKS, ETC., July 31st.—Electric lighting and power wiring at Natural History Museum, South Kensington, London, S.W. Specification, etc., from Contracts Branch, King Charles Street, London, S.W.1; deposit £1 1s



THE posters which were awarded the first, second and third prizes respectively, offered by the Radio Manufacturers' Association in connection with the National Radio Exhibition to be opened at Olympia in September.

Digitized by Google

ROCHFORD GUARDIANS, August 7th.—Underground cables, switchgear instruments, wiring, 25 H.P. motor, starting gear, etc. Specification, etc., from Mr. H. Tomlinson-Lee, 26, Victoria Street, Westminster, S.W.1; deposit £2 2s.

UTTOXETER URBAN DISTRICT COUNCIL, August 12th.—Overhead 11 000 V transmission line; e.h.t. and l.t. cables and roadwork and public lighting; and sub-station equipment. Persons desiring to tender must notify Mr. W. C. C. Hawtayne, 9, Queen Street Place, London, E.C.4.

NEWCASTLE ENDOWED SCHOOLS, August 24th.—Electric light installation in a new wing to be erected at each of two schools, viz.: Newcastle-under-Lyme High School, and Newcastle-under-Lyme Orme Girls' School. Specifications, etc., from Messrs. Cramp and Frith, 1, Dickinson Street, Manchester; deposit £3 3s. in respect of one contract, or £6 6s. in respect of both contracts. Tenders are invited only from firms on the National Register of Electrical Installation Contractors.

COMMITTEE OF VISITORS OF GLOUCESTERSHIRE MENTAL HOSPITALS, August 26th.—Electric wiring of Wotton and Coney Hill Mental Hospitals, on "Stannos" earthed concentric system. Specification, etc., from Messrs. Handcock and Dykes, 11, Victoria Street, Westminster, S.W.1; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

NEW ZEALAND POSTS AND TELEGRAPHS, July 23rd.—Supply of bronze and copper wire (tender No. P. and T. 151/1 599). (Reference A.X. 8 192.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 23rd.—Telegraph instruments (schedule C. 436). (Reference B.X. 5 323.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 23rd.—Adhesive insulating tape (schedule C. 457). (Reference B.X. 5 459.)

ST. JOSEPH'S CHURCH, CARRICKMACROSS, July 24th.—Electric wiring. Specification, etc., from Messrs. MacEntee and O'Kelly, 23, O'Connell Street, Dublin; deposit £1 1s.

VICTORIAN RAILWAY COMMISSION, July 24th.—Electric overhead travelling cranes, spare motors, and down shop trolley wires (contract No. 42 672). (Reference A.X. 8 092.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, July 25th.—Supply of two 2-ton electrically-driven hoist blocks (tender No. 1 471). (Reference A.X. 8 072.)

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY CO., July 26th.—Supply of electric overhead travelling cranes, etc. Forms of tender and specification (£1, not returnable) from Mr. S. G. S. Young, secretary, 91, Petty France, Westminster, S.W.1.

MIDDLEBURG (S. AFRICA) MUNICIPALITY, July 29th.—Supply and erection of steam raising plant, steam driven alternator, condensing plant, 6 600 V transmission line and switchgear. (Reference B.X. 5 348.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 30th.—Motor driven centrifugal pump, to deliver 400 gallons per minute against total head of 50 feet, the motor to be wound for 230 V d.c. (Reference A.X. 8 150.)

CAPE TOWN MUNICIPALITY, July 31st.—Supply of paper-insulated, lead-sheathed cables (specification No. 467/1929). (Reference B.X. 5 486.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, August 1st.—One 10-ton electrically-driven overhead travelling crane, for Maritzburg workshops (tender No. 1 487). (Reference A.X. 8 105.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 1st.—Supply of telephone cable (tender No. 160). (Reference B.X. 5 345.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor, overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

NEW ZEALAND POSTS AND TELEGRAPHS, August 7th.—Enamelled and silk-covered resistance wire (No. P. and T. 151/1 497). (Reference B.X. 5 322.)

PORT ELIZABETH MUNICIPALITY, August 8th.—One 250 kVA, 3-phase, self-cooled type, indoor transformer (specification No. 30). (Reference B.X. 5 487.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 8th.—Telegraph material, including g.i. tubular side-arms, insulators, paper sleeves, insulator spindles, etc. (tender No. 161). (Reference A.X. 8 112.)

CHILEAN MINISTRY OF MARINE, August 9th (extension of time).—Supply and erection of two aerial towers for new wireless station at Arica. (Reference A. 8 244.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, August 12th.—Supply and erection at Burrinjuck of auxiliary hydro-electric generating plant. (Reference B.X. 5 365.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th.—Water turbine driven generating sets and switchgear for Waitaki power development (section 2). (Reference B.X. 5 278.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 13th.—Supply of electric power plant, with underground and overhead network, for the town of Maghagha, Minieh Province. (Reference B.X. 5 318.)

CHILEAN STATE RAILWAYS, August 16th.—Material for overhead lines, underground cable and cable boxes (Group 41); and material for lighting of locomotives and carriages (Group 43). (Reference C. 3 069*.)

CHILEAN STATE RAILWAYS, August 16th.—Telegraph and telephone materials, including copper wire and cable, switches, table telephones (Ericsson type), telephone cords, etc. (Reference C. 3 072*.)

CHILEAN STATE RAILWAYS, August 16th.—Supply of instruments of staff or tablet type, for installation at 36 stations between Alameda and Talca, locking apparatus for switches batteries and telephone combinations. (Specification C. 3 070*.)

URUGUAY POSTS, TELEGRAPHS AND TELEPHONES, August 17th.—Supply of telegraph wire. (Reference A.X. 8 229.)

AUCKLAND ELECTRIC POWER BOARD, August 19th.—Single-phase transformers. (Reference B.X. 5 324.)

PORT ELIZABETH MUNICIPALITY, August 22nd.—One 10 000 kW turbo generator and condenser, boiler, steam and feed water pipes, etc. (Reference B.X. 5 430.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 22nd.—Extension magneto bells, bell sets, condensers, magneto generators, central battery switchboard, tumbler switches, wall and table telephones, etc. (Reference B.X. 5 415.)

GREY ELECTRIC POWER BOARD, August 27th.—Supply and erection of generating plant, for the Arnold river hydro-electric scheme. (Reference B.X. 5 422.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, August 27th.—Supply of cord type switchboards (schedule C. 448). (Reference B.X. 5 428.)

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 7th.—Supply of v.i.r. wire. (No. P. and T. 151/1 573.) (Reference B.X. 5 416.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 10th.—Two-conductor cords (P. and T. 151/1 600). (Reference B.X. 5 462.)

LOURENCO MARQUES PORT AND RAILWAYS, September 11th.—Battery tractors and trailers. (Reference A.X. 8 172.)

BULAWAYO MUNICIPALITY, September 13th.—Supply of h.t. overhead transmission lines, stepdown transformers, pumps with motors, etc. (Reference A.X. 8 181.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, September 24th.—Supply of condensers (schedule C. 461). (Reference B.X. 5 488.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply, erection and maintenance of coal conveying plant. Specification (No. 29/68) from the Agent-General, Victoria House, Strand, London, W.C.; deposit, £2 2s.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 15th.—Seven 5 500 kVA single phase auto-transformers, with accessories, for Waitaki power scheme. (Reference B.X. 5 417.)

Tenders Accepted.

WAR OFFICE.—Metro-Vick Supplies, Ltd., 12 months' supply of electric fans.

BARNSTAPLE CORPORATION.—Mirrlees, Bickerton and Day, Ltd., 300 kW Diesel set, £5 532.

BURTON-ON-TRENT.—Forest City Electrical Co., erection of electric traffic signals in Station Street, £105.

LINCOLN CORPORATION.—Kirk, Wright and Co., electrical portion of 32 all-electric houses at St. Giles housing site.

BEDFORD CORPORATION.—Chloride Electrical Storage Co., Ltd., extension of battery, £339 8s. 7d. (Recommended.)

CANTERBURY GUARDIANS.—G. E. Dashwood, electric light installation in remaining portion of institution, £144 10s. 9d.

Digitized by Google

CROYDON CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply of two 400 kVA transformer kiosks, £167 10s. each. (Recommended.)

CAMBERWELL (LONDON) BOROUGH COUNCIL.—W. M. Williamson, additional electric lighting at Wells Street baths, £118 15s. (Recommended.)

ROTHERHAM RURAL DISTRICT COUNCIL.—F. L. Smith, electric light installation in 12 houses at Wickersley, £55; and in 40 at Thrybergh, £173.

ILFORD CORPORATION.—Metropolitan Electric Cable Construction Co., Ltd., and Union Cable Co., Ltd., supply of cables. (Both recommended).

ROCHDALE CORPORATION.—H. Tattersall, Ltd., electric lighting and power installations to 138 houses on the Rathbone Street and Dicken Green estates.

London School Lighting.

LONDON COUNTY COUNCIL.—J. Briggs, Electrical Contractors, Ltd., electric lighting at Marvels Lane School, Lewisham, £365. (Recommended.)

GLASGOW CORPORATION.—Mensons, Ltd., fittings for destination boxes; Titan Trackwork Co., Ltd., special tramway track work. (Both recommended.)

SHOREDITCH (LONDON) BOROUGH COUNCIL.—City Electrical Co., electric lighting installations at 32 tenements on Whitmore housing estate, £485. (Recommended.)

ST. HELENS (ISLE OF WIGHT) URBAN DISTRICT COUNCIL.—Isle of Wight Electric and Power Co., Ltd., electric light installation at the Puckpool Park Café, £110 3s.

ILFRACOMBE URBAN DISTRICT COUNCIL.—Ilfracombe Electric Light and Power Co., Ltd., electric light installation at isolation hospital, £50, including lamps, shades, plugs, etc.

BARKING URBAN DISTRICT COUNCIL.—Hackbridge Electric Construction Co., Ltd., supply of 2-400 kVA transformers, £179 each, in connection with supply to River Road.

AUSTRALIAN COMMONWEALTH GOVERNMENT.—Standard Telephones and Cables, Ltd., supply and installation of British-made plant at two subsidiary stations under new national broadcasting scheme.

BRADFORD CORPORATION.—Electric light installations at Council houses: Armitage and Longbottom, 180, £625 10s.; Taylor and Ashworth, 36, £108; H. Taylor and Co., Ltd., 24 single rooms, £49 4s.

SALFORD CORPORATION.—E. M. Evans and Son, maintenance of internal telephones at town hall and education offices, for five years, £190; Yorkshire Electric Transformer Co., Ltd., four 216 kVA transformers, £440. (Both recommended.)

H.M. OFFICE OF WORKS.—Metro-Vick Supplies, Ltd., part contract for Cosmos electric lamps, for 12 months; Edison Swan Electric Co., Ltd., supply of lamps; Siemens Electric Lamps and Supplies, Ltd., 12 months' supply of Siemens gasfilled and vacuum lamps.

BIRKENHEAD CORPORATION.—Macintosh Cable Co., Ltd. (£1 276) and Hackbridge Cable Co., Ltd. (£1 982), supply of cables. W. T. Henley's Telegraph Works Co., Ltd., supply of overhead lines in connection with supply to Burton and Puddington, £4 483 15s.; Liverpool Patents Co., Ltd., supply of trident electric scaling machine at gas works, £80.

HULL CORPORATION.—W. F. Dennis and Co., supply of cable for telephones department, £1 295. (Recommended.)

SHEFFIELD CORPORATION.—A. Reyrolle and Co., Ltd., supply of two 11 000 V feeder panels, £468 5s.; T. A. Ashton, Ltd., installation of Frigidaire apparatus at Crimicar Lane hospital, £280, and at Commonside hospital, £194.

GLASGOW CORPORATION.—Electric Vehicles, Ltd., supply of utility electric truck for Govan refuse works, £233; Richard Garrett and Sons, Ltd., six electric vehicles, for refuse collection, £1 098 each; A. Reyrolle and Co., Ltd., two 20 000 V feeder panels at Cadogan sub-station, £1 327 16s.; Anderson and Monro, Ltd., main switchboard at M'Lellan galleries, £129 19s. (All recommended.)

CROYDON CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., two 400 kVA transformer kiosks, £167 10s. each; A. Reyrolle and Co., Ltd., two sets of oil-immersed fuses, £95 5s. each, and armour-clad switch, £193 2s.; British Electric Transformer Co., Ltd., one 100 kVA transformer, £112 10s., and 250 kVA transformer in connection with supply to works of Creed and Co., Cherry Orchard Road, £180 10s. (All recommended.)

STEPNEY (LONDON) BOROUGH COUNCIL.—British Thomson-Houston Co., Ltd., supply of four 1 500 kW motor convertors and switchgear, for sub-stations, £19 933 16s. (Recommended.) Also tendered: Ateliers de Constructions Electriques de Charleroi, £19 600; Metropolitan-Vickers Electrical Co., Ltd., £19 982 12s.; Bruce Peebles and Co., Ltd., £20 204 10s.; General Electric Co., Ltd., £20 236; English Electric Co., Ltd., £20 305 5s.

TORQUAY CORPORATION.—British Thomson-Houston Co., Ltd., supply of switchgear, £696; English Electric Co., Ltd., installation of voltage regulator at Paignton for dealing with next winter's load on the e.h.t. system, £1 400; Metropolitan-Vickers Electrical Co., Ltd., 2 000 kVA Scott transformer group, £905 17s.; Stirling Boiler Co., Ltd., supply of flat furnace arches of "Liptak" type for two boilers at generating station, £1 024 10s.

GLASGOW CORPORATION.—A. Reyrolle and Co., Ltd., supply of switchgear, £4 408 18s.; British Thomson-Houston Co., Ltd., starting gear for motors, £520; Callender's Cable and Construction Co., Ltd., supply of 20 000 V cable, £4 419 10s.; W. T. Glover and Co., Ltd., supply of 6 500 V cable, £2 320; Kennedy, Stark and Co., electric light installation at Dixon Hall, £421 6s. 1d.; R. J. M'Intyre, electrical installation at 492 houses on Haghill estate, £2 076 8s.; J. P. Hall and Co., frequency changer, £318 10s. (All recommended.)

CAPE TOWN CORPORATION.—Albert Vaux, Ltd., 250 fuses (350 A), £331 5s., and 50 pairs of spare contacts, £37 10s. Supply of transformers: Bruce Peebles and Co., Ltd., three 1 000 kVA, £592 each; Reunert and Lenz, Ltd., ten 300 kVA, £206 each, seven 150 kVA, £136 each and eight 100 kVA, £97 each; Metropolitan-Vickers Electrical Export Co., Ltd., five single-phase, £289 18s. 4d. each; Dowson and Dobson, Ltd., two 300 kVA, £205 each and two 150 kVA, £120 each; South African General Electric Co., Ltd., two 300 kVA, £219 each and two 150 kVA £145 each. (All recommended).

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.—Enfield Cable Works, Ltd., 1 650 yd. 0·25 four-core cable, £2 013; 500 yd. 0·15 four-core cable, £405; 300 yd. 0·0145 four-core cable, £67; 5 000 yd. 0·01 l.t. twin cable, £575. (Recommended.) Also tendered: British Insulated Cables, Ltd., £2 040; £410; £69; £583. Pirelli-General Cable Works, Ltd., £2 044; £410; £69; £584. W. T. Glover and Co., Ltd., £2 050; £413; £69; £586. Siemens Bros. and Co., Ltd., £2 068; £416; £69; £590. Union Cable Co., Ltd., £2 073; £418; £70; £593. Callender's Cable and Construction Co., Ltd., £2 074; £417; £69; £593. Macintosh Cable Co., Ltd., £2 079; £419; £70; £594. W. T. Henley's Telegraph Works Co., Ltd., £2 092; £421; £70; £600.

MANCHESTER CORPORATION.—Sudlow and Co., electrical installation at Burnage School; Seddon and Sons, electrical installation at Higher Ormond Street school; Welding Equipiment Co., Salford; Equipment and Engineering Co., Ltd., and Quasi-Arc Co., Ltd., supply of mild steel electrodes; R. H. Clampnett and Co., supply of electric cable for Water Street depot; Tudor Accumulator Co., Ltd., repairs to Dickinson Street battery; British Thomson-Houston Co., Ltd., supply of three 1 000 kVA transformers; Hackbridge Electric Construction Co., Ltd., supply of one 11 500 kVA auto-transformer; A. Reyrolle and Co., Ltd., supply of 33 000 V feeder protective gear; R. Johnson and Nephew, Ltd., supply of cadmium copper trolley wire; British Insuated Cables, Ltd., supply of tramway rail bonds.

ADVISORY COMMITTEE ON COMMUNICATIONS.

In accordance with the recommendations of the Imperial Wireless and Cable Conference which sat in London last year, it has been decided to set up an Imperial Communications Advisory Committee, which is to be charged with responsibilities in regard to the institution of new services, the discontinuance of existing services, alterations in rates, and distribution of traffic between alternative routes. One of the main features of the plan proposed by the Imperial Wireless and Cable Conference is the fixing of a standard net revenue which should be available for the purposes of the communications company, and 50% of all net revenue in excess of that standard is to be devoted to the reduction of rates or such other purposes as the Advisory Committee may approve. The following appointments to the Advisory Committee have been made: United Kingdon—Sir Courtauld Thomson. Canada—Sir Campbell Stuart. Australia—Mr. Clive L. Baillieu. New Zealand—Sir James Parr. Union of South Africa—Lieut.-Col. E. A. Sturman. Irish Free State—Mr. T. J. Kiernan. India—Sir Atul Chatterjee. Colonies and Protectorates—Sir Edward Davson.

ELECTRICITY SUPPLY.

County of London Co.'s Charges—Omagh Electricity Scheme—Bulk Supply to York Hospital—Consumers Benefit from Standard Prices—Leicester Lighting—Keswick Objects to Overhead Lines—Battersea Power Station.

AUCHTERARDER T.C. has decided to carry out a scheme of lighting the streets electrically.

Tunbridge Wells T.C. has received sanction to a loan of £13 302 for mains, plant, sub-stations, etc.

Stranraer T.C. has adopted a scheme for the supply of electricity in the town by the Holderness Trust.

Kingston-on-Thames T.C. has applied for a loan of £43 762 for extensions of the plant at the electricity works.

Douglas (Isle-of-Man) Corporation's Pulrose station is expected to be running before the end of the summer.

Keswick U.D.C. has informed the Central Electricity Board that it insists upon underground cables being used through the town.

Castleford U.D.C. has instructed the Surveyor to investigate the question of the Council generating the electricity required by its departments.

Bradford Electricity Committee has decided to carry out a change over from d.c. to a.c. in the Heaton and Frizinghall districts, at a cost of £22 028.

The laying of the main to Briercliffe has been completed, and a supply of electricity is now being afforded by Burnley electricity department to that district.

Notice of a motion to remit to the Treasurer's Committee of Musselburgh T.C. the question of purchasing the local electricity supply undertaking has been lodged.

Winchester Corporation has applied for a loan of £11 400 for a supply to Twyford and Compton. Electricity is to be supplied in bulk by Southampton Corporation.

Croydon Electricity Committee propose to erect and equip a new sub-station at Ena Road, at an estimated cost of £1 275; while mains extensions are to be carried out at a cost of £687 10s.

Carlisle Electricity Committee obtained sanction to borrow £3 500 for mains extensions, £5 000 for prospective unspecified expenditure on electricity meters and £15 000 for mains and services.

West Lancashire D.C. has decided to apply for an Order to carry out an electricity scheme for the parishes of Hesketh-with-Becconsall, Tarleton, Rufford, North Meols, Scarrisbrick, and Halsall.

Godalming T.C. is to enter into an agreement with the Urban Electric Supply Co. for public lighting for one year at 34s. per lamp for maintenance and renewals and 3d. per kWh for current.

Colchester Electricity Committee is to seek sanction for a loan of £40 000 for mains and services.—The Committee has asked the Electrical Engineer to take steps to afford a supply to the Eight Ash Green district.

Electricity Distribution of North Wales and District, Ltd., has submitted to St. Asaph P.C. a scheme for lighting the streets electrically at a cost of £3 5s. per lamp. The Council has referred the matter to a committee.

The County of London Electric Supply Co. has reduced its lighting flat rate from 6d. to 5½d. and the unit charge under the domestic and business "all in" tariff from 1d. to ¾d. in the administrative County of London.

Scarborough T.C. has applied for loans of £10 000 for supplying electricity by an overhead line to Filey, £2 500 for a supply to Scalby Mills Lane, and £3 700 for a supply by overhead lines to Osgodby and district.

Omagh U.D.C. has received from Mr. P. A. Spalding details of a scheme for lighting the district electrically. The cost is estimated at £9 000, the amount of the anticipated receipts for the first year is £1 934, and the net profit £189.

Dartford Electricity Committee reports that the trustees of the Swaisland Estate have consented to the laying of the ring main through the Stanham Farm Estate, and tenders have been invited for the supply of the necessary cable.

Newry U.D.C. has decided to proceed with a scheme for electric light and power installations in the town hall and the technical school. The Town Hall and Electricity Committees are to take expert electrical advice as to the best system of wiring the buildings.

Reigate T.C. has decided to extend the mains to houses to be erected on the Monson Estate by Mr. C. Franklin, at an estimated cost of £1 130, subject to a guarantee of 8% on the capital outlay for 25 years, or until the gross annual revenue reaches £226.

York Electricity Committee recommends an agreement with the Visiting Committee of the North Riding Mental Hospital for a bulk supply of electricity at £5 per kVA per annum (minimum, £100 per annum), plus 0·7d. per kWh, subject to the Corporation's usual coal clause.

London County Council Highways Committee states, in a report on the effect of the agreements entered into with the London electricity supply companies in 1925 with regard to standard prices, etc., that, up to last year, consumers had benefited by being charged less than the standard prices to the extent of £1 348 778.

The electric lighting of the streets of Leicester is to be extended and improved. In the town hall square there are to be 28 lamps of 750 c.p. each, in addition to two standards bearing four lamps each at the main entrance of the town hall. Thirty new lamps are to be attached to the tramway standards on the Aylestone Road. All these new lamps are to be automatically controlled.

A deputation, headed by Sir John Randles, urged Keswick T.C. last week to oppose the proposal to erect overhead cables in the district. The Chairman (General W. Spedding) said he was sure the scheme would bring cheaper electricity. The better way would have been to work with and not against the Electricity Board. The Council decided, with one dissentient, to ask for an inquiry.

A new scheme for supplying electricity for domestic use has been approved by Fleetwood Electricity Committee. The tariff is 20% of the net rateable value per annum, plus ½d. per kWh for current consumed for lighting and power. Each consumer must have appliances equal to 2 kW in addition to lighting equipment, and must undertake to continue to use electricity under the scheme for 12 months.

The Exe Valley Electricity Co., which, subject to the consent of the Electricity Commissioners, will shortly receive bulk supply from Exeter, is one of the undertakings of Whitehall Securities Corporation, Ltd. In anticipation of this development, the Electricity Committee, at last week's meeting of the Exeter City Council, was authorised to apply for a loan not exceeding £15 000 for the provision of cables.

London County Council Public Health Committee has recommended the Council not to support the resolution passed by a conference of local authorities to oppose the erection of the new Battersea power station. The Committee recommended the Council to ask the Minister of Health to receive a deputation from the Council on the subject of efficient safeguards, and the Council has adopted the suggestion.

Oldham Electricity Committee has decided to supply electricity through slot meters at 5d. per kWh. The Electrical Engineer is to prepare a scheme for wiring houses on a deferred payment scheme.—The Committee has obtained sanction for a loan of £70 000, the estimated cost of the tie and inter-connecting mains between the new generating station of Slacks Valley and Greenhill station and the existing e.h.t. distributing system.

Kendal T.C. has received sanction to a loan of £5 000 on account of the sum required for feeder and distributing mains, and a further loan of £10 000 for a similar purpose has been applied for. The Council has appointed Mr. J. E. Storr, at a fee of 60 guineas, to prepare a scheme for the transmission and distribution of electricity over the area covered by South Westmorland Rural Council, with the exception of the district included in the Order of the Windermere and District Electricity Supply Co.

St. Pancras (London) Electricity Committee reports that a method devised by the Chief Electrical Engineer for dealing with dust and grit at the King's Road generating station is to be applied to boilers Nos. 7 and 8. The system comprises water-spraying apparatus in the chimney of the boilers. Tests made by independent experts have confirmed the efficiency of the method in absorbing the sulphurous and sulphuric acids. To restrict the emission of dust into the chimneys, the Chief Electrical Engineer has devised a scheme whereby large chambers can be inserted between the outlets of the boilers and their chimneys, which will permit of the speed of the travelling gases being reduced from 27 ft. per second to 7 ft. per second; and, if necessary, treated with water sprays.

COMPANY NEWS.

Cables and Wireless Quotations—Sale of Fife Tramway, Light and Power Co.'s Undertaking—Petters' Increased Profit—Prosperous Condition of W.T. Henley's Co.—Directors' Reports—New Electrical Companies Registered.

THERE is not much to record of the electrical share market this week. Cables and Wireless quotations appear to have settled down at round about 90, the "A" ordinary at a little under and the "B" ordinary at a little over that figure. Siemens shares are a further 1s. 3d. down and Callender's have lost half-a-crown. Ever Readies have dropped 6d. below 20s. Electric Construction 7% preference at 21s. 3d. are 7½d. to the good. British Electric Traction 6% preferred stock are two points and Metropolitan Railway ordinary and London United Tramways 1st debenture stock each one point down.

BIRMINGHAM DISTRICT POWER AND TRACTION CO., LTD.—Intm. div. of 3% actual is announced.

CHISWICK ELECTRICITY SUPPLY CORPORATION, LTD.—Intm. div. on ord. shs. of 7½% will be payable on July 23.

NORTHERN MEXICO POWER AND DEVELOPMENT CO.—Divs. of 1¾% on pref. stk. and 1% on common stk. have bn. declared.

BELLISS AND MORCOM, LTD.—Blce. on rev. acct. for year ended March 31, £26 531. Fin. div., makg. 12½ % for year, proposed.

ANGLO-AMERICAN TELEGRAPH CO., LTD.—Divs. for qrtr. ended June 30th of 15s.% on ord. stk. and £1 10s.% on pfd. stk., less tax, will be payable on Aug. 1st.

ROTHESAY TRAMWAYS CO., LTD.—Rev. for 1928, £18 914, workg. pft. £4 513, agst. £4 346. To depreciation, £4 022. Div. of 5% on pref. shs. for year. Fwd. £1 846.

TRACTION AND GENERAL INVESTMENT TRUST.—Int. div. for half-year ended June 30, 1929, 2½% actual on pref. stk., and 6% actual on ord. stk., less tax, payable July 31.

FIFE TRAMWAY LIGHT AND POWER CO., LTD.—At an extraordinary gen. mtg. held on Monday, the shhldrs. approved the sale of the electricity undertakgs. to the Scottish Power Co.

EASTERN EXTENSION, AUSTRALASIA AND CHINA TELEGRAPH CO., LTD.—Int. on 4% mtge. deb. stk. for half year endg. July 31 will be paid on Aug. 1st. Deb. register will be closed from July 27th to 31st, inclusive.

WEMYSS AND DISTRICT TRAMWAYS CO., LTD.—Net pft. for 1928, £7 817, includg. £167 brt. in, after provisn. for reserves in subsidiary cos., £4 096. Int. £6 560, deb. stk. redemptn. £200; to res., £1 000. Fwd., £56.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—Reg. qrtrly. div. of $0·50 p. sh. was recently announced. This is first div. declared on new cap. stk. without par value. Rate of div. is equivalent to rate formerly declared on $100 shs. of cap. stk.

HEAD, WRIGHTSON AND CO., LTD.—For year ended April 30 credit blce. was £4 783 (agst. £17 554), plus £1 170 brt. in. Transferred from res. for gen. purposes, £13 000, makg. total £18 953. Int. on debs., £6 750, div. on pref. shs. £10 148, and directors' fees £1 000, leavg. blce. carried fwd., £1 056.

CITY OF SANTOS IMPROVEMENT CO., LTD.—Net rev. for 1928, £166 465, plus £18 252 brt. in. After provisn. for deb. int., sinkg. funds, div. on 6% pref. shs. and intm. div. of 3%, tax free, on ord. shs., blce. was £116 847. To tramways renewal acct., £10 000. All shhldrs. accepted offer of Brazilian Traction Light and Power Co. to purchase ord. shs.

JAMES KEITH AND BLACKMAN CO., LTD.—Accts. for year ended March 31, 1929, show blce. of mfg. and tradg. acct. £120 152, transfer fees, etc., £11, and int. on investmts. deposit acct. etc., £2 172, and, after provisn. for all exes., includg. patent renewal fees and auditors' fee, income-tax, deb. int., and depreciatn. (£3 201), net pft. transferred to blce. sheet was £43 087. To res., £12 000; div. on ord. shs., 15%, less tax; fwd., £13 740.

VICTORIA FALLS AND TRANSVAAL POWER CO., LTD.—After providg. for int. and premium on debs. (£121 849, agst. £133 387) and for depreciatn., income-tax, etc. (£610 754, agst. £516 598), net pft. for 1928 was £377 295, agst. £373 445, plus £141 451 brt. fwd. To res., £50 000 (same). Fin. div. of 1% on pref., makg. 10%, and fin. of 12% on ord., makg. 15%, all less tax, for the year have been declared. Fwd. £153 747. Directors have also declared div. of 3%, less tax, on pref. for six months ended June 30th, 1929.

CABLES AND WIRELESS, LTD.—The co. announces that the certificates of "assents" deposited with the Bank of England at the close of business on July 10 instant were: Eastern Telegraph Co., Ltd., 97·04 %; Eastern Extension Australasia and China Telegraph Co., Ltd., 96·93 %; Western Telegraph Co., Ltd., 96·89 %; Marconi's Wireless Telegraph Co., Ltd., 88·45 %. The offer was conditional upon its being accepted within the prescribed time by holders of 60 % (or such smaller percentage as might be approved by the Government) of the amount of stock, or number of shares, affected by the offer in the four respective companies.

NORTH WALES POWER CO., LTD.—Pft. for 1928, £77 102 (agst. £47 572). After paymt. of deb. int., blce. is £26 540, includg. amt. brt. in. To special int. res., £1 404; to special

Digitized by Google

renewals fund, £5 000. Blce. (£20 136) to special int. res. Special renewals fund with above additn. was £25 000, of which £20 884 is still available. New power statn. at Maentwrog was brt. into operatn. during latter part of year, and sale of electrical energy durg. 1928 increased by about 11% over that of previous year. Since close of year two important transactns. have taken place. Co. has entered into a satisfactory contract with Central Electricity Board; and a scheme for financial reorganisatn. of co. has been carried through successfully.

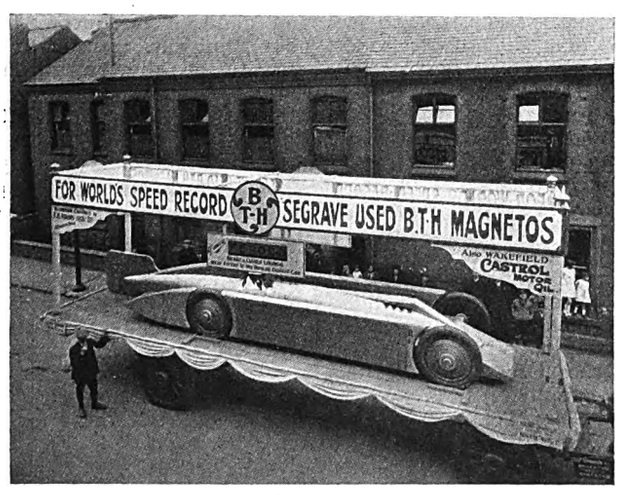
UNDERGROUND GROUP.—Directors have declared intm. divs. for six months ended June 30, 1929, as follows: *Metropolitan District Railway Co.* on 4% guaranteed stk., 2%, on 4½% 1st pref. stk. 2¼%, on 5% 2nd pref. stk. of 2½%, on ord. stk. 2½% (same). *London Electric Railway Co.*, on 4% pref. stk. 2%, on con. ord. stk. 2½% (same); *City and South London Railway Co.*, on 5% pref. stks. 1891, 1896, 1901 and 1903, 2½%; on con. ord. stk. of 2½% (same). *Central London Railway Co.*, on undivided ord. stk, 2½% (same), on pfd. ord. stk., 2% (same). *Associated Equipment Co., Ltd.*, on ord. shs. 4%, tax free (same). *Underground Electric Railways Company of London, Ltd.*, on 6% 1st cum. income deb. stk., 3%, on 6% income bonds, 3 % (same), on ord. shs. 3% (same). The divs. will be payable on Aug. 7, other than the int. on the 6% 1st cum. income deb. stk. and 6% income bonds of the Underground Co., which will be payable on Sept. 2.

Company Meetings.

ELECTRIC AND GENERAL INVESTMENT CO., LTD.—Mr. J. B. Braithwaite, presiding at the meeting on July 9th, said: There is no great change in our profit for the year. The earnings are £13 175, against £10 691 last year. That is accompanied by other changes in the balance-sheet which are equally on the right side. Our loans from the bank and others have been reduced by £41 000 during the year and our debenture stock outstanding has been reduced by £4 652 to £3 170. As a consequence of these reductions in our liabilities our investments have been reduced by £52 007 and our cash has been increased by £5 491. We are recommending a dividend upon both the ordinary and the deferred shares. I am glad to say that the improvement in the value of our investments amply justifies this recommendation. During the past year our assets have further improved in value, so that at the end of May our investments were worth more than the figure at which they appear in the balance-sheet. In addition to that, we have a free reserve fund of £50 000 and a carry forward of over £20 000. We have also cleared off the whole of the outstanding income certificates. After providing for general charges, £2 738, debenture interest, £215, preference dividend, £4 776, 10% of our ordinary shares, £2 000, and a payment of 1s. per share on our deferred shares, also £2 000, there remains out of the profit of the year (£13 175) a balance of £1 444. You may say we have been a long time reaching this position. This is the 40th annual meeting of this company, but I would remind you that we were the pioneers, or at any rate one of the pioneers, in financing the electrical industry, and naturally we suffered the fate of most pioneers, and have had a very long row to hoe. We hope we are now coming into the due reward of our 40 years work. The report and accounts were adopted.

PETTERS, LTD.—Sir Ernest W. Petter, presiding at the meeting on July 12th, said: We have been glad to be able to announce some progress in the result of the year's trading which, having regard to the conditions prevailing in the engineering industry, is very satisfactory. During the year we have introduced a new type of engine which we have designated the Atomic Diesel. This engine, which is a cold-starting heavy oil engine, has been well received by our agents at home and abroad, and the prospects of sales are distinctly good. As regards investments, we still hold our British Government stocks. There is a reduction in the amount under the heading of Petters (Ipswich) Ltd., due to £22 000 of debentures having been repaid, and a further £20 000 has since been received by us since March 31st for debenture redemption. We have a net profit of £32 891, an increase of about £7 300. Adding the amount brought forward, we have a disposable balance of £52 436. Interest on the funding certificates and provision for redemption for the year to July 15th require £2 500. We now recommend that the half-year's dividend on the preference shares, due at March 31st, 1929, less tax, be paid, and also a dividend on the ordinary shares at the rate of 6% per annum, less tax, being the same as last year. We also recommend that £10 000 be transferred to reserve fund, raising the same to £85 000, and that the balance of £28 536 be carried forward. I was greatly encouraged by the references to the potentialities of our Empire made by the mover of the Address in the House of Commons last week. I have never ceased to endeavour to impress upon my fellow-countrymen that it is to the Empire we must look for the solution of our great national problems, and in particular to the solution of the unemployment problem. We intend that there shall be no lack in that spirit of confidence and adventure which we have shown in the past, and His Majesty's Government can count on us to do our utmost to back up their efforts for the expansion of our industry and the welfare of our people. The report and accounts were adopted.

ARON ELECTRICITY METER, LTD.—Mr. Harry Kahn, presiding at the meeting on July 8th, said the directors had reluctantly come to the conclusion that it would not be prudent to distribute the balance of £1 795 remaining to the credit of profit and loss account after payment of the interest on the 6% cumulative income debenture stock, for the reasons given in the report. The balance-sheet, reflected again a sound position. Profit on trading showed an increase over last year of £2 768. The net profit for the year, £6 594, showed an improvement of £1 419. Adding the carry forward of £161 and deducting interest on converted preference shares and 6% income



AT the recent "Lady Godiva Procession and Pageant" with which was incorporated the Coventry Hospital Carnival, the British Thomson-Houston Co., Ltd., had a number of exhibits in the procession. One of the awards secured by this company was the first prize in the horse-drawn tradesmen's exhibits section, the exhibit being a full-size model of the "Golden Arrow" car, the original of which was fitted with B.T.H. magnetos. Another attractive exhibit by the B.T.H. Co. effectively illustrated their range of fractional horse power motors and some of their many applications in industry and the home. Both the magnetos and motors exhibited were, of course, manufactured in the company's Coventry works.

Digitized by Google

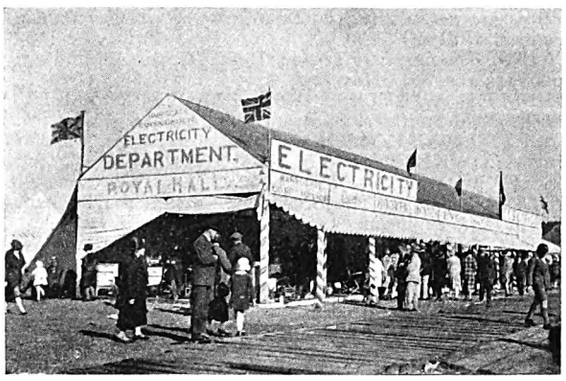
debenture stock, left a balance of £1 795 to carry forward. The shareholders would no doubt wish to know why they did not declare an ordinary dividend, however small, but the fact was they did not consider it prudent to do so in view of all the circumstances. Vienna, whose financial year started on October 1st last, showed a considerable decrease in turnover, chiefly owing to the shortage of money prevalent in Austria, which prevented the municipalities from giving their usual orders. He understood, however, that the position there lately in that respect was improving. In London the position was also rather difficult, as managers of supply undertakings were keeping their meter orders as low as possible in view of the uncertainty as to the eventual decision of the Electricity Commissioners in regard to the basis on which current should be charged. There was also pending the question of changing the supply of continuous current to alternating current. They were doing all in their power to meet the situation by bringing their factory in London up to modern standards. After moving the adoption of the accounts, the chairman called upon Sir Hugo Hirst to second the resolution, and added that he regretted to say that owing to his many activities Sir Hugo had felt compelled to tender his resignation as a director of the company. Sir Hugo Hirst expressed his regret that he found it necessary to resign from the board. The shareholders, he said, had nothing to worry about, for practically the whole of the capital was in safe assets. They had nearly £100 000 in cash, and valuable assets in the Vienna factory, the London factory, newly equipped, and their investment in the Taximeter Co., which was a very satisfactory concern, and, as far as he could see, their assets were perfectly intact. The report and accounts were adopted.

W. T. Henley's Telegraph Works Co., Ltd.—Sir George Sutton, presiding at the meeting on July 12th, said: The figures in the profit and loss account do not differ greatly from the previous year. The considerable sum of £47 829 is allowed for depreciation, in addition to which, not shown on the account, there has been an expenditure for maintenance of £34 500, which has been charged against revenue. If you adapt the board's recommendations, there will be a balance to carry forward to the unknown future of £545 000. I will deal briefly with some of the main causes for the company's prosperity. Its goodwill, I suppose, should be put first; it has been made by many years of good service; and then its organisation, which enables the staff to follow the course of the manufacture of all its products and to direct the business into channels which are to be preferred. The industry is a very live one, and the turnover for the year under review is a record. Home and overseas trade have both increased. The overseas trade is responsible for 40% of the total output of the business. Profit in the way of percentage on cost is lower, but the larger trade has increased the amount. Two years ago I informed you that we had just completed a working agreement with certain other cable makers. The difficulties have been great, and modifications in the original agreement may yet be necessary, but the benefits already realised have been considerable. There had to be an endeavour to consider the interests of one's allies as much as one's own interests, and it has not always been easy to attain that atmosphere. The progress has, perhaps, been slow, but it has been sure, and other firms have sought to join the alliance, and negotiations have been entered into and in some cases completed. Besides a continuous endeavour and some advance in improving the means for the distribution of electricity, or, in other words, the designing of electric cables and accessories to give increased efficiency, success has been achieved in the reduction of cost of production. The lower costs due to rationalisation mean lower prices to meet competition for orders at home and abroad. They have a twofold effect, they lower prices to the user or consumer and so possibly bring about a larger demand. The ability to compete in price for overseas business should bring more orders to the allied firms, and the increase of demand due to lower prices should also bring more business to the allies. It is this increased business, by meeting competition and by increasing demand, which should, and I think I may say must, bring larger sums to the credit of the profit and loss accounts of the allies. It may be convenient here to say a few words respecting the resolution which will presently be moved for the bonus to the hourly paid workers. The bonus will consist of two weeks' pay based on a normal week of 47 hours, excluding any extra payments made for night work or overtime. The report and accounts were adopted, and resolutions were passed approving the bonus scheme and increasing the remuneration of each of the directors by £500 per annum.

NEW COMPANIES.

Camden Electric, Ltd.—Cap., £500. Electricians, manufacturers of and dealers in electrical apparatus, plant and appliances, etc. Reg. Office: 92, Park Street, Camden Town, London, N.W.1.

Rolyat Electrical Co., Ltd.—Cap., £500. To adopt agreement with Mary D. Taylor, and carry on business of electricians, wireless, telegraph, telephone, electrical or experimental engineers, manufacturers of and dealers in electrical and wireless apparatus, etc. Reg. Office: 11, Furzedown Market, Tooting, London, S.W.17.



THE stand of Harrogate Electricity Department at the Royal Agricultural Society's Show in Harrogate. Firms which assisted in making up the comprehensive exhibit were Credenda Conduits, Ltd., Hoover, Ltd., the Jackson Electric Stove Co., Ltd., the British Vacuum Cleaner and Engineering Co., Ltd., the Revo Electric Co., Ltd., Electrolux, Ltd., Belling and Co., and Santon, Ltd. Wireless equipment was exhibited by Mr. R. C. Burrell, of Harrogate. During her visit Princess Mary asked the Mayor of Harrogate (Capt. C. W. Whitworth) specially to show her the electrical exhibit, and she was much interested in many of the items on view.

Nucomotors, Ltd.—Cap., £200. Automobile and mechanical engineers, electricians, electrical engineers, etc. Reg. Office: 141, Battersea Park Road, London, S.W.8.

Improved Wilson Microphone and Electrical Co., Ltd.—Cap., £100. Electrical or wireless dealers, etc. Secretary: J. McGuire, 4, Lloyd Square, London, W.C.1.

British Household Appliances, Ltd.—Cap., £1 000. Manufacturers of and dealers in household and domestic utilities and appliances, motor and radio engineers, electricians, etc. Reg. Office: 1, Budge Row, London, E.C.4. (Public Co.)

Frank White, Ltd.—Cap., £5 000. To acquire undertaking of Woore White, Ltd., carrying on business as engineers, etc., at Richmond Foundry, Liverpool, and to carry on same and business of mechanical and electrical engineers, etc. Reg. Office: 41, North John Street, Liverpool.

Marco Refrigerators (1929), Ltd.—Cap., £200 000. To acquire business carried on by Marco Refrigerators, Ltd., with the trade mark "Marco," to adopt an agreement with the said company, R. A. Fulford and A. E. Leach, and to carry on business of manufacturers of and dealers in refrigerators, electrical and general engineers, etc. Reg. Office: Manor Works, Streatham Vale, London, S.W.16. (Public Co.)

Geo. Crossley and Son, Ltd.—Cap., £2 000. To acquire business of dealers in electrical accessories carried on by G. Crossley and G. B. Crossley as the Crossley Electric Co., at 4, South Street, Manchester, and to carry on same and business of electric light, power and radio engineers, manufacturers and installers of wireless apparatus, heating accessories, departmental telephones, electrically illuminated signs, electric bells, etc. Reg. Office: 4, South Street, Manchester.

Tele-Radió, Ltd.—Cap., £700. Manufacturers, purchasers, hirers, importers and exporters of and contractors for sale, supply, letting on hire, installation and maintenance of plant, machines, instruments and apparatus, in particular those used in connection with television, radiovision, noctovision, wireless telegraphy, telephony and similar sciences, or for reproduction, production or recording of sound in synchronisation with films, photographs and pictures, etc. Reg. Office: 4, Copthall Chambers, London, E.C.2.

Boroughbridge and District Electric Supply Co., Ltd.—Cap., £10 000. To acquire benefits of Boroughbridge and District Electricity Special Order, 1928, made by the Electricity Commissioners in favour of R. F. Winder, authorising supply of electricity within parts of townships of Boroughbridge, Aldborough, Minskip, Roecliffe, Ellenthorpe, Kirby Hill, Landthorpe and Milby, with certain personal property and assets belonging to the said R. F. Winder and used in connection with generating, accumulating, distributing and supplying electricity within the said area and with certain real and personal property belonging to R. F. Winder and C. E. Winder. Solicitor: D. Green, Boroughbridge. (Public Co.)

MORLEY, Frank Johnson, 304, Clapham Road, Clapham, electrical engineer. £10 19s. 6d. June 4th.

RIPON ELECTRICAL CO., 39, Kirkgate, Ripon, engineers. £35 16s. 4d. June 13th.

TURTON, Mr. L. W., 47-9, Balderton Gate, Newark-on-Trent, electrical apparatus dealer. £10 4s. 8d. June 7th.

WARNER, Walter John, 13, Windsor Road, Willesden Green, electrician. £47 6s. 5d. May 10th.

Bills of Sale.

BARNETT, Bernard, 41, Beehive Lane, Ilford, electrical engineer. Dated July 8th, filed July 15th. £300.

HEARN, Frederick Charles, The Rest, Brighton Road, Rottingdean, electrical contractor. Dated July 1st, filed July 5th. £40.

SMITH, William, 24, Hampstead Road, Elm Park, Liverpool, electrician. Dated June 28th, filed July 2nd. £100.

Deeds of Arrangement.

ATHERTON, Jack, 15, Mawdsley Street, and 49, Rydal Road, Bolton, electrical engineer. Dated July 11th, filed July 12th. Trustee, C. A. Wragge, 15, Mawdsley Street, Bolton, accountant. Liabilities unsecured, £858; assets, less secured claims, £205.

ATHERTON, Walter Edmund, trading as ATHERTON AND HALL, Claremont Works, General Street, Blackpool, radio engineer. Dated July 4th, filed July 9th. Trustee, I. G. Aspinall, 7, Birley Street, Blackpool, C.A. Secured creditors, £3; liabilities unsecured, £842; assets, less secured claims, £417.

MIDGLEY, John Bird, and GREEN, Albert, trading at Orme Buildings, Parsonage, Manchester, as ANDERSON AND GREEN, wholesale electricians. Dated July 5th, filed July 9th. Trustee, A. Yearsley, 27, Brazennose Street, Manchester, I.A. Liabilities unsecured, £4 113; assets, less secured claims, £2 033.

Receiverships.

DUGGAN AND LEE, LTD. E. J. Turbyfield, of 65A, Fenchurch Street, E.C.3, was appointed receiver and manager on July 5th, 1929, under powers contained in debentures dated July 19th, 1928.

OLDHILL MANUFACTURING CO., LTD. A. N. Flemming, accountant, of 24, Shiplake Buildings, Calvert Avenue, E.2, was appointed receiver on July 5th, under powers contained in debentures dated June 1st, 1929.

NORTHERN REFRIGERATION AND ELECTRICAL CO., LTD. (originally W. T. RAWCLIFFE, LTD., renamed OWEN AND CHARLTON, LTD., and again renamed as above). J. R. Charlesworth, C.A., of 85, St. Petersgate, Stockport, was appointed receiver and manager on June 26th, 1929, under powers contained in debenture dated June 5th, 1923.

Mortgages.

[NOTE.—*The Companies Act of* 1908 *provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

ANIMATED DISPLAYS, LTD., London, W.C., dealers in electric signs.—Registered June 29th, £100 debenture, to H. H. Pearce, Longford Avenue, Southall; general charge.

EXPRESS MAGNETO (REPAIRS) AND ELECTRICAL CO., LTD., Yeovil.—Registered June 25th, £450 (not ex.) mortgage, to Bank; charged on land and premises in Holloway Street, Exeter. *£400. March 26th, 1929.

M.E.D.A.S., LTD., London, W., electrical engineers.—Registered June 21st, series of £2 200 debentures, present issue £1 855; general charge.

PEERLESS ELECTRICAL MANUFACTURING CO., LTD., London, W.—Registered June 28th, agreement supplemental to debenture dated May 22nd, 1928, to Bank; charged on hire purchase agreements, etc. *£5 000. September 25th, 1928.

RUSSELL (J. W.), LTD., Watford, electricians. Registered June 22nd, £4 000 debentures; general charge.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

HENDON ELECTRIC LAMP CO., LTD. At the statutory meeting of the creditors in this voluntary winding-up, the liquidator, Mr. F. Rowland, submitted a statement of affairs which disclosed liabilities to unsecured creditors of £929, against net assets £403, or insufficient to pay the claim of the debenture holder, which approximated £700. The receiver for the debenture holder is realising the assets. The liquidator stated that the company secured a fairly large contract for the supply of electric lamps to the Durban Corporation. The contract ran into some hundreds of pounds and every effort was made to carry out the contract, but some of the lamps were rejected on the ground that they were faulty. That put the company to considerable loss. Towards the close of last year the Omega Lamp Co. were creditors for something like £1 000 and they ultimately agreed to accept £750 in discharge of their claim. They pressed for payment of that amount, but the company was unable to settle, owing to the loss on the Durban contract and other matters. The company were then asked to give a debenture to secure the Omega Co. He (Mr. Rowland) was consulted with regard to the debenture and pointed out that if it was issued in the form proposed the Omega Lamp Co. would be able to call the money in at any moment. Eventually, however, it was agreed that the debenture should be issued to the Omega Co., who undertook not to exercise the right to foreclose so long as the Hendon Electric Lamp Co., Ltd. paid £40 a month. Some of the instalments were paid, but finally the company got in arrear and a receiver was appointed. The receiver was not appointed until some time had been given to the company in which to look around with an idea of finding further capital. That additional capital, however, was not forthcoming and the receiver took possession. It was true that the debenture was for a past consideration, but it was issued more than three months prior to the liquidation and was, therefore, good. The debenture issued by the company became good in March and the receiver was not appointed until some little time later.

No definite resolution was passed, but it was agreed that the voluntary liquidation of the company should be continued with Mr. Rowland as liquidator. The following are creditors:—Ashdown, H. E., and Co. (Birmingham), Ltd., £26; Beko Lamp Co., £25; Electric Heating Co., £11; Eltrem and Co., £32; Hirschberg, E., and Co., £55; Knowles, J. and Co., Ltd., £12; London Commercial Stores, Ltd., £75; Neglin Co., £80; Nelson Electric Co., Ltd., £50; Overseas Engineering Co., Ltd., £11; Snape, H., and Sons, £17; Stella Lamp Co., Ltd., £16; Universal Lamp Co., £67; Whitchurch Electric Lamp Co., £53.

STONE MANUFACTURING CO., 108 and 109, Great Saffron Hill, E.C., wireless and electrical dealers. A meeting of the creditors in this matter was held on July 12th at the offices of Lever Bros. and Co., C.A., Chiswell House, Finsbury Pavement, E.C., when the representative of the Brownie Wireless Co., the largest creditors, presided. A statement of affairs was disclosed showing liabilities of £1 936, of which £1 065 was due to the trade, the bank were creditors for £156, loan creditors totalled £380, and advertising, royalties and sundries amounted to £335. The bank were also secured creditors for £274. The assets totalled £265, from which had to be deducted preference claims of £69, leaving net assets of £196, or a deficiency of £1 740.

The accountant said there were negotiations pending at the present time whereby another company would take over the business and if that were so, the creditors should receive a satisfactory dividend. The debtor was unable to make any offer on his own behalf. A creditor in the room said that the negotiations for the taking over of the business could only be carried out provided that the moulding tools should be returned by the creditors who at present held them. Several creditors said that under no circumstances could those mouldings be returned, even if the creditors were to receive 20s. in the £. It was pointed out that the offer would therefore have to fall through for the taking over of the business. After considerable discussion it was decided that the estate should be dealt with under a deed of assignment in favour of Mr. Lever as trustee with a committee of inspection consisting of three of the creditors. The following are creditors:—Brownie Wireless, £230; Lewis Banks and Son, £214; Ebonestos Insulators, £119; John, Son and Watts, £105; McLeod and McLeod, £80; County of London Electric Supply Co., £23; Hawkins, F. F., £21; Lever Bros. and Co., £19; Maydew, £10.

London Gazette, etc.

Company Winding-up Voluntarily.

HIGHTENSITE AND ECONITE MANUFACTURING CO., LTD.—By reason of its liabilities, July 2nd. A. A. Lough, Chartered Accountant, 8, Frederick's Place, Old Jewry, London, E.C.2, appointed as liquidator.

Bankruptcy Petition.

THORNTON, William Haigh, 25, Bridge Street, Burnley, electrical and wireless engineer. A bankruptcy petition against this debtor has been presented by the Secretary of J. Dyson and Co., Ltd., manufacturers of radio and electrical equipment, and is to be heard at Burnley County Court on August 13th, at 10.45 a.m.

Bankruptcy Information.

BAINES, Gerald Talbot, 66, High Street, Gorleston, Suffolk, electrical engineer. Receiving order, July 13. Debtor's petition.

BRAYSHAW, D. (Mr.), 78, Granby Street, Liverpool, electrician. Receiving order, July 10th. Creditor's petition.

COWEN, Kenneth, trading as E. COWEN, 41 and 43, The Village, Lower Bebington, Chester, electrical engineer. Receiving order, July 9th. Debtor's petition.

Notices of Dividends.

EDWARDS, William Houston, The Docks, Milford Haven, electrical engineer. First and final dividend, 6d. per £, payable, July 19th, 4, Queen Street, Carmarthen.

JACOB, William Thomas, 14, Meyrick Street, Pembroke Dock, Pembroke, wireless engineer. First and final dividend, 2s. 6d. per £, payable, July 19th, 4, Queen Street, Carmarthen.

Notices of Intended Dividends.

KIRK, Ernest William, trading as the ACE RADIO MANUFACTURING CO., 26, Curzon Street, Derby, formerly wireless apparatus maker. Last day for receiving proofs, July 31st. Trustee, L. A. West, 22, Regent Street, Park Row, Nottingham, Official Receiver.

SEWELL, Sidney James, and BROWN, William Lewis, trading as SEWELL AND BROWN, 6A, The Exchange, Muswell Hill, Middlesex, electrical and radio engineers. Last day for receiving proofs, July 30th. Trustee, F. Vyvyan, Bankruptcy Buildings, Carey Street, London, W.C.2, Official Receiver.

SOUTHWOOD, Thomas Southwood Smith, Pound Farm, Whyke Road, Chichester, electrical engineer. Last day for receiving proofs, July 30th. Trustee, R. W. Cave, 12A, Marlborough Place, Brighton, Official Receiver.

THE LEAD MARKET.

Last week's market opened with forward lead 1s. 3d. up, while later, according to James Forster and Co., the tone was firm at 5s. per ton advance. On Wednesday and Thursday prices fell back 6s. 3d. per ton, but on Friday, after opening slightly easier, the market firmed up again and closed unchanged.

The American price, which had remained stationary at 7 cents since April 15th, was lowered on July 5th, to 6.95 cents and again on July 10th to 6.75 cents.

Closing prices on July 12th were £22 15s. for July and August, £22 16s. 3d. for September and October, 1s. 3d. down to unchanged on the week.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

311 640 J. McLEAN. Galleries for electric lamps. (31/10/28.)
299 812 BRITISH THOMSON-HOUSTON CO., LTD. Electric power systems for ship propulsion and other purposes. (1/11/27.)
300 211 MARCONI'S WIRELESS TELEGRAPH CO., LTD. Aerial systems. (8/11/27.)
301 744 BRITISH THOMSON-HOUSTON CO., LTD. Electric discharge devices. (2/12/27.)
303 119 A. JASICEK, and F. POLNAUER. Electric shuttle-operating devices for power looms. (28/12/27.)
311 218 UNITED WATER SOFTENERS, LTD., and E. B. HIGGINS. Electrolytic production of sterilizing agents, germicides and the like, and processes for applying such agents. (6/2/28.)
311 826 A. F. SYKES. Electromagnetic transmitters and receivers for reproducing sound. (23/11/27.)
283 543 DUBILIER CONDENSER CO. (1925), LTD. Electrical condensers. (13/1/27.)
311 666 SIEMENS BROS. AND CO., LTD., C. L. PETERS, and D. A. CHRISTIAN. Automatic telephone systems. (11/1/28.)
311 792 W. FENNELL. Means for the protection of electrical installations. (17/1/28.)
311 793 BRITISH THOMSON-HOUSTON CO., LTD., M. C. I. HUNTER, and W. P. HAMLYN. Electric switchgear. (17/1/28.)
311 794 BRITISH THOMSON-HOUSTON CO., LTD., M. C. I. HUNTER, and W. P. HAMLYN. Draw-out electric switchgear. (17/1/28.)
311 676 A. G. KERSHAW and WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD. Railway signalling-apparatus of the double-wire transmission type. (11/2/28.)
311 677 STANDARD TELEPHONES AND CABLES, LTD. (WESTERN ELECTRIC CO., INC.). Composite magnetic materials. (11/2/28.)
311 796 INTERNATIONAL GENERAL ELECTRIC CO., INC., and C. G. MAYO. Measuring and like apparatus for use with high-potential circuits. (14/2/28.)
311 681 BRITISH THOMSON-HOUSTON CO., LTD., and F. P. WHITAKER. Vapour-electric rectifiers. (14/2/28.)
311 682 S. MORSE. Electric heating-units. (14/2/28.)
311 684 CREED AND CO., LTD., and F. G. CREED. Printing-wheels suitable for use in telegraphic receiving and printing apparatus. (14/2/28.)
311 685 STANDARD TELEPHONES AND CABLES, LTD., and W. K. WESTON. Electric communication cable. (14/2/28.)
311 686 STANDARD TELEPHONES AND CABLES, LTD., and M. S. SNELL. Automatic switches for telephone systems. (14/2/28.)
311 722 BRITISH THOMSON-HOUSTON CO., LTD., and L. B. AULT. Electromagnetic instruments for converting oscillating currents into sound and vice versa. (15/2/28.)
311 801 BRITISH THOMSON-HOUSTON CO., LTD., and J. C. READ. Vapour-electric rectifiers. (16/2/28.)
311 806 F. H. ROYCE. Control of output of variable-speed electric dynamos. (17/2/28.)
311 807 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., and C. H. BRIZELL. Interlocking electromagnetic relays. (17/2/28.)
311 810 W. E. BEATTY (BELL TELEPHONE LABORATORIES. INC.). Picture-transmission system. (17/2/28.)
286 666 L. N. BRILLOUIN. Device for producing electric discharges of predetermined duration, and constant intensity. (8/3/27.)
287 161 C. LORENZ AKT.-GES. Remote-control arrangements for electric alternating-current distribution systems. (18/3/27.)
311 849 H. R. MILNES. High-tension electrical supply for wireless apparatus. (27/2/28.)
311 853 E. D. FELDMAN. Electric motors. (29/2/28.)
294 225 SIEMENS AND HALSKE AKT.-GES. Luminous circuit charts. (22/7/27.)
311 851 E. Y. ROBINSON and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Vacuum electric tube devices. (28/2/28.)
311 870 R. I. DENHAM. Electromagnetic actuating-mechanism for the reproduction of sound with radio loud-speakers, telephone receivers, and the like. (21/3/28.)
311 871 ENGLISH ELECTRIC CO., LTD., and H. BACON. Mechanical trip devices applicable for use with electric switches and for other purposes. (22/3/28.)
311 881 P. FREEDMAN and W. J. RICKETS. Electrical relays and amplifiers. (29/3/28.)
287 914 A. GIAMBERTONI. Electrically-driven floor brushes. (29/3/27.)
311 811 W. FENNELL. Means for the protection of electrical installations. (17/1/28.)
311 893 GRAHAM AMPLION, LTD., and P. K. TURNER. Means employed for supplying current or potentials from mains to utilisation means. (3/4/28.)
311 895 MIDLAND ELECTRIC MANUFACTURING CO., LTD., and W. L. BARBER. Electrical switches and switch fuses. (4/4/28.)
311 906 R. I. SCORER. Incandescent electric lamp fittings. (16/4/28.)
311 914 SIEMENS BROS. AND CO., LTD. (C.W. SCHOFIELD). Electric cables. (24/4/28.)
311 915 R. NETTL. Electric switch lamp holders and the like. (24/4/28.)
311 921 COVENTRY AUTOMATIC TELEPHONES, LTD., and J. COLLYER. Means for measuring the rate of generation of electrical impulses. (26/4/28.)
311 929 R. AMBERTON and ELECTRICAL APPARATUS CO., LTD. Measuring or indicating instruments. (5/5/28.)
291 028 D. H. ROWLAND. Multi-part insulators. (24/5/27.)
290 584 G. CATTANEO. Timing-adjustment of magnetos for internal-combustion engines. (13/5/27.)
305 453 LEIPZIGER SCHNELLPRESSENFABRIK AKT.-GES. VORM. SCHMIERS, WERNER & STEIN. Method of producing points of adhesion for galvanic deposits on light metal bodies. (4/2/28.)
291 734 BRITISH THOMSON-HOUSTON CO., LTD. Apparatus for the inter-conversion of mechanical and electrical oscillations. (6/6/27.)
311 963 J. H. PEASE. Miners' electric safety lamps. (15/6/28.)
294 208 WESTINGHOUSE LAMP CO. Gaseous-conduction electrical rectifiers for alternating current. (20/7/27.)
311 981 ELECTRO-MECHANICAL BRAKE CO., LTD., and J. H. WILLIAMSON. Trucks or wheeled underframes for tramway, railway, and like vehicles. (12/7/28.)
296 664 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Remote-control systems. (3/9/27.)
311 992 M. KRAMER. Electrically-heated massage appliances. (25/7/28.)
296 432 NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Circuit arrangements for operating an electric discharge tube with direct current. (2/9/27.)
312 006 HEVI DUTY ELECTRIC CO. Electric resistance furnaces. (22/5/28.)
298 572 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Mercury-vapour rectifiers. (11/10/27.)
299 322 AKT.-GES. BROWN, BOVERI, ET CIE. Double-cap insulators. (21/10/27.)
301 753 SOC. FRANCAISE RADIO-ELECTRIQUE. Electric selective arrangements for operating alarm devices. (2/12/27.)
302 901 C. LORENZ AKT.-GES. Electric transmission of pictures. (23/12/27.)
305 131 C. LORENZ AKT.-GES. Arrangements for eliminating disturbing and secondary waves in wireless circuits. (31/1/28.)
283 544 L. V. SMITH and G. W. WAITE. Electric water-heater. (18/7/27.)
290 556 DUBLIER CONDENSER CO. (1925), LTD. Electrical condensers. (14/5/27.)
312 099 F. H. ROYCE and E. F. CLARK. Control of output of variable-speed electric dynamos. (18/1/28.)
312 100 BRITISH THOMSON-HOUSTON CO., LTD., and L. J. CLARK. Vacuum devices such as electric incandescent lamps, electron discharge tubes, and the like. (18/1/28.)
312 104 BRITISH THOMSON-HOUSTON CO., LTD., H. S. PETCH, and R. D. PARRY. Electric time-delay devices. (20/1/28.)
281 311 G. VIARD. Measurement of cross-talk in telephone lines. (25/11/26.)

Digitized by Google

312 406 J. L. Baird and Television, Ltd. Television apparatus. (30/11/27.)
281 676 Akt.-Ges. Brown, Boveri et Cie. Method of operating a synchronously constructed generator with a commutator cascade machine, the excitation of which is supplied at least in part through a frequency changer. (3/12/26.)
285 074 R. Bosch Akt.-Ges. Dynamo-electric lighting systems. (11/2/27.)
312 382 Sykes and Dyson, Ltd., P. Sykes, and W. Cooper. Electric junction-boxes. (18/2/28.)
312 113 J. W. Davison, J. F. Perry, and Associated Electrical Industries, Ltd. Controlling mechanism for moving devices or apparatus, more particularly for winding, hauling, hoisting, and like gear. (18/2/28.)
285 513 Allgemeine Elektricitats-Ges. Method of and means for electrical resistance welding. (18/2/27.)
312 116 G. J. Blake and G. D. G. Leadbetter. Mercury-vapour arc lamps. (20/29/28.)
312 117 G. J. Blake and G. D. G. Leadbetter. Mercury-vapour arc lamps and rectifiers. (20/2/28.)
312 205 F. Berg. Insulator for electric live wires. (20/2/28.)
312 119 Standard Telephones and Cables, Ltd., and E. Kaempf. Electric communication cable. (20/2/28.)
312 120 Standard Telephones and Cables, Ltd., and J. H. E. Baker, and E. P. G. Wright. Automatic or semi-automatic telephone systems. (20/3/28.)
312 121 British Thomson-Houston Co., Ltd., and F. E. Smith. Signs or other advertising-devices. (20/2/28.)
312 127 F. Newton. Regulators for dynamo-electric machinery and other electric apparatus. (20/2/28.)
285 795 P. Fitzner. Base for automatic telephone instruments. (16/5/27.)
312 130 J. Copp, F. Tait, and A. C. Tait. Gramophone electrical "pick-up" devices. (21/2/28.)
285 912 E. F. Northrup. Method and apparatus for correcting power factor of electric circuits. (25/2/27.)

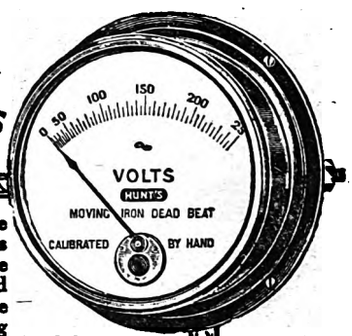
OIL SWITCHES

Ammeters and Voltmeters (Commercial Types)



WE can offer a wide range of Ammeters and Voltmeters whose high quality, low cost and generous terms make them an outstanding proposition to Switchboard Manufacturers.

For most standard readings and finishes we can give delivery from stock

All Instruments are hand-calibrated against standard and conform to B.S.S. specifications as regards insulation.

We have been Sole Agents for these instruments for over 15 years, and therefore offer them to Manufacturers with an exceptional degree of confidence.

Voltmeter Type MI/DB/S/bc. (moving iron, dead beat, switchboard fitting, back connections) as illustrated, black and nickel finish 6" dial 0/250 volts

LIST PRICE **44/-**

Please *send us specifications and quantities of instruments which you are proposing to use, so that you can see how our special nett quantity prices appeal to you!*

free **ON REQUEST** *for your guidance, our Catalogue No. 61 giving particulars of the complete range.*

The Dorking Enquiry.

THE Ministry of Transport's inquiry at Dorking, last week, into the Special Order under which the Dorking U.D.C. leases the local electricity undertaking to Edmundson's Electricity Corporation, Ltd., for a further term of 40 years, was at first sight of purely local interest. Closer examination of the position suggests that the general questions involved may not be without importance in other areas, a view which is, to some extent, confirmed by the interest shown by the London and Home Counties' Joint Electricity Authority, which, for the first time since its establishment in 1925, appeared as an opponent to a Special Order. Pending the announcement of the Minister of Transport's decision we do not propose to comment on the Dorking case. We may, however, point out that the general method—of which the Dorking proposal is but one instance—of extending the tenure of companies who ask for high maximum unit prices and a fixed minimum dividend, which is automatically increased with every reduction in unit prices, is one which, while ostensibly safeguarding the consumer, may, on occasion, operate in a contrary direction. At present, it is true, the generating costs of some of these companies are high, and a big drop in their charges to consumers can hardly be anticipated under the conditions now obtaining. On the other hand, a reduction of unit prices to so low a figure as 6d.—which normally would not be considered cheap—would generally give to the company a big percentage increase in dividend, though the consumer would receive a correspondingly smaller percentage reduction in price. If, however, we look even a few months ahead, the position of the majority of the smaller supply companies will be considerably altered. Cheap supplies from the "grid" will become available to many of them, and the prices at which they will be able to secure a bulk supply will be so low as to make their legal maximum prices look quite absurd. Naturally the consumer will derive some benefit from the existence of the cheap "grid" supply, but some of the companies are bound to obtain a proportionately greater advantage from a service which they have done next to nothing to provide. There is, of course, no crime in making a profit; on the contrary, it is most desirable so long as it is reasonable. But we question whether loopholes should be provided—which may or may not be used—whereby those who may not be content with a reasonable profit can manipulate the "grid" supply in such a way as to derive from it far more advantage than the consumer, for whose benefit it was chiefly designed.

Marconi Royalties.

A MEETING of importance to electrical contractors was held in London, on Wednesday, when the council of the Radio Manufacturers' Association placed before the members details of an arrangement which had been arrived at between a Negotiating Committee of the Association, the Marconi Co. and the Gramophone Co. with respect to royalties. The negotiations were, of course, made necessary by the result of recent litigation between the Brownie Wireless Co. and the Marconi Co., and though the position of the Marconi Co. at the end of such litigation was exactly the same as before, the R.M.A. has prevailed upon the company to reconsider the royalty question. At Wednesday's meeting members were recommended to accept terms upon which to form a new licence with a royalty basis of 5s. per valve holder on all sets, whether incorporating a Marconi patent or not; to agree to a royalty of 5s. on battery eliminators, valve or metal rectifier, incorporated in a complete set; and to pay a royalty of 6% of the list selling price on eliminators not included in a complete set. The agreement covers the period 1928–1933, and permits licensees to use any existing or future patent owned or controlled within the time limit of the licence, by the Marconi Co., the Radio Corporation of America, the G.E.C. of America, the Gramophone Co., and the French and German Associates of these companies, in return for which the Marconi Co. may use, without payment of royalty, any patent owned or controlled by R.M.A. members. The Royalty on exported sets is to be 5s. per valveholder, except in the case of Australasia, when the royalty applicable is to be 2s. 6d. The Marconi Co. has agreed to do all in its power to restrict the importation of foreign-made sets and has furthermore agreed to prosecute in all cases of infringement of patents. The terms of the agreement, if accepted, also provide for the payment of arrears in royalties over an indefinite period. Whether or not the R.M.A. will accept the terms of the new licence remains to be seen, but since

481847A

Digitized by Google

the National Radio Exhibition is to be opened in two months' time a quick decision is called for. In any case the new conditions would allow of a price reduction on all sets and eliminators, while the question of the free use of R.M.A. patents affecting radio receivers is best answered by considering whether or not those patents are of such importance as materially to benefit the Marconi Co. It is a rather unpleasant pill for the R.M.A. to swallow perhaps, but, on the other hand, a reduction of 7s. 6d. in the royalty charge is not any too pleasant to the Marconi Co., especially in view of the fact that the R.M.A. lost the day in the Brownie test case.

The Factory Lighting Campaign.

THE report of the E.L.M.A.-E.D.A. Factory and Workshop Lighting Campaign, which has just been published, indicates that the campaign was something of a success, and though at this early period it is difficult to estimate the amount of business which has been directly obtained from the efforts, the numerous letters which have been received clearly indicate the substantial commercial value of the campaign. From one area alone 100 inquiries resulted in nine definite orders and 55 prospects which are still "alive" Another report shows that the campaign was directly responsible for six installations approximating in all over 600 fittings, while in another area 1 800 industrial fittings have been supplied as a result of the special effort. As will be gathered from the abridged report published elsewhere in this issue, no fewer than 5 931 persons attended the 192 meetings, and as many as 96 towns took part. Workshops and sections of workshops were loaned by manufacturers for lecture demonstrations, while in other cases public halls, technical colleges and showrooms were utilised. The finances of the campaign have proved sufficient to meet all expenses, and the balance is to be devoted to the production and circulation of a booklet embodying photographs of modernised industrial lighting installations, and expressions of opinion as to their value. This booklet will be available for mailing on October 1st. so as to reach factory owners immediately before the end of summer time. The E.L.M.A. and the E.D.A., and in particular, Mr. J. L. H. COOPER, are to be congratulated on the successful conclusion of the campaign, though, in fact, no conclusion has yet been reached. Such an effort will, of course, remain "alive" for many years, since many of those factory owners who have not yet acted upon the advice they have received with respect to lighting, will, when enlarging their works or moving to new areas, put to practical value the information which the campaign has given them.

Electricity in Heat Waves.

THE recent hot weather has presented those who sell certain domestic electrical appliances with a wonderful opportunity, of which one hopes they have taken full advantage. We refer, of course, primarily to electric fans, then to electric refrigerators, though electric cookers should not be overlooked as "coolth" promoters. The scarcity of fans and refrigerators makes real summer weather almost unendurable in the large centres of population in this country, and, apart from domestic users, there must be many works, offices and public buildings which would readily instal such efficient cooling media if only they were approached in the right way. We have also referred to electric cookers, which, though not directly cooling, at least have the advantage of not making a warm kitchen hotter. There is a good deal to be done in the pushing of electric cooker sales in the summer months, and those who have recognised this fact find it decidedly advantageous to spread this business more evenly over the entire year than to be content with seasonal trading.

Summer Selling.

THE business of levelling up valleys is just as important in the manufacturing world as it is on the supply side, and the electrical manufacturer who seriously sets about levelling up his sales curve usually has little cause to regret he extra effort. Within the last few days we have come across more than one application of the levelling-up principle. In one case a firm making domestic electrical appliances has so altered the shape of its sales curves that the sales for May, June and July, which are normally valley months, have not only been brought up to existing peak levels, but have begun to form new peaks. It would be idle to pretend that selling in the holiday months is not attended by certain unavoidable difficulties, but the experience of the firms we have in mind clearly shows that such obstacles are surmounted by those who have sufficient determination to profit by existing conditions.

"The Padlocked Cooker."

DURING the last few days the newspaper-reading public has been regaled with a very clever advertisement in which pride is properly taken in the achievement of a certain gas cooker, which, when fitted with a special thermostatic device, was able to produce a properly cooked meal after being chained and padlocked for a suitable period. This "triumph of cooking under lock and key, without fuss, without watching, without basting, without turning," is proudly put forward as something which no other cooker in the world could have done. While we are prepared to allow the advertisement writer some of the licence which is the traditional right of the poet, we can hardly resist the temptation to remind him that this feat is being performed daily by thousands of electric cookers in this country. Many of these electric cookers can even turn on the heat at a predetermined hour, without human intervention.

Television and the B.B.C.

ONCE again friction has been caused between the B.B.C. and the Baird Television Development Co. over the vexed question of demonstration facilities. It will be remembered that last March the late Postmaster-General gave consent to the B.B.C. using one of their stations for the purpose of transmitting television, and expressed himself as anxious that facilities should be afforded, so far as was practicable without impairing the broadcasting service, for continued experiment with Baird apparatus. According to the Baird Television Co. the B.B.C. then offered three morning broadcasts weekly, each of a quarter of an hour's duration. This the Baird Co. insists is inadequate. Whatever may be the opinion of the B.B.C. of the progress so far made with television, we fail to see why the Corporation cannot provide better facilities for experiments in a science which must eventually become as public a service as that of broadcasting. The B.B.C. have been granted a monopoly, and out of consideration of that favoured position the least they can do is to assist other sciences allied to broadcasting by permitting experiments in transmission of longer duration than fifteen minutes, three times a week. Since the erection of a private station for the transmission of television is, under present conditions, out of the question, the B.B.C. is the only possible means whereby radio television can be developed in this country, and it appears to us that the public would be better served were the Corporation to take a rather broader view of the position, especially when it is remembered that the funds of the B.B.C. are subscribed by those very people who are anxious for television to become as general as the broadcasting of sound.

Postmark Publicity.

THE excellent facilities now afforded by the Post Office for the franking of letters for commercial undertakings do not seem to be sufficiently appreciated. For the information of those who are not familiar with the device, it may be explained that correspondence so treated is overprinted in one operation with a postage stamp, the usual circular date and place of posting stamp and a panel 2¼ in. wide by 1 in. deep containing a slogan chosen by the firm concerned. By this simple means every letter sent out contains an advertisement for the sender. An example of intelligent use of this service reached us one day this week, when a letter from the Leicester Electricity Department carried the slogan "Electricity makes everything so Easy."

CONCRETE POLE DESIGNS AND COSTS.

Inefficiency of Existing Constructional Methods—Why Concrete Pole Lines should be Made on Site—Some Interesting Features of the Process—Detailed Costs Show Economy of Concrete.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E.

TAKEN broadly, there is much less excuse for casting a pole remote from the actual position it takes up in the line than there is in casting a heavy concrete water pipe at a point far removed from its final destination. For the pole, an entirely different kind of foundation is required, and the kind of pole referred to herein specially favours making the foundation the first operation (not the last), thus having the advantage of 100% undisturbed ground; moreover, the concrete pole can be quite easily and properly cast by hand, and, when cast in its final vertical position in the line, the concrete will possess the advantage of hardening under less moisture content and greater weight-pressure, conditions which tend to increase the quality, density, and strength of the pole just where they are most required.

The risk of fracture or injury due to the five operations (referred to below) before the pole is in its final place is great, and the method is both inefficient and uneconomical. The great weight of concrete destined for transport and to repeated handling is no doubt *the* main factor disqualifying the more general use of reinforced concrete for poles. The inherently superior qualities of concrete cannot be denied by anyone. The high first cost *per pole* in place is the principal objection, and this first cost cannot be reduced until we overcome or greatly reduce such costs as the moving and handling at works during the casting and curing and storing, haulage by road to the nearest railway station, rail transport, road transport and handling from railway to the pole line location, as well as the handling and erection on site. When *all* these costs are largely overcome, we shall then be in a position favourably to compete with the cost of a wood pole line, but not otherwise. Therefore, if we desire to have a cheap, stronger, and a better pole line, we must first change our methods. The money wasted " on the road " should be put into the pole and counted as effective pole materials and design strengths, all of which are of direct and lasting benefit to the electricity supply undertakings.

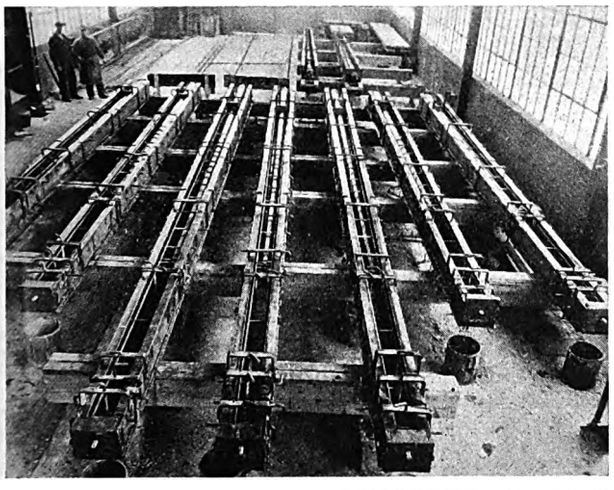
Use of the absolute minimum amount of material, with its consequent dangers and disadvantages, can be avoided by casting the poles or frames or structures right on the spot, i.e., each pole in its actual final position in the line. From the electricity supply undertaking's viewpoint this is most decidedly the better method, not only because the first total cost can be much less, but also because the complete making and construction can be inspected by them; there is no handling, no transport or haulage; on undisturbed ground, the foundation is made first; the pole is built up and left to cure and harden inside a moistened wooden form; the finished pole is neither disturbed nor moved; the greatest effective and most efficient mass of concrete is provided at the least cost. Actually, the whole of these operations tend to favour the electricity supply engineer, because he is securing the most of everything he desires in a pole and its foundation for the least money.

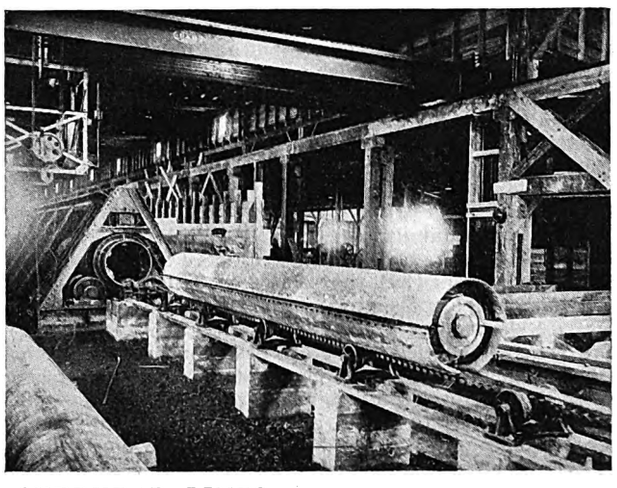
The steel assembly and welding or/and tying of hoops or spirals is completed, and the pre-cast blocks for centreing and positioning the steel are placed, before the completed steel reinforcement is set in the partly-built wooden form. In this position there is no more difficulty or uncertainty in the shifting of steel position than there is with the centrifugal and spun processes; also, the raising of from 50 to 200 lb. weight of concrete (per lift) is of no consequence whatever.

No Movement of Reinforcement.

When talking on this very point, the writer was recently questioned as to the iron reinforcement shifting its position, the possibility of longitudinal rods converging, and such like questions based on little construction experience. At least four of the outer longitudinal rods are assembled and tied or/and welded at intervals to the hoops, over which may (as desired) be threaded the interspaced small pre-cast concrete pieces, so that there cannot be any possibility of steel converging. This assembly and welding may, if cheaper and better, be done at a special works, or on the site as desired. Actually, there is less chance of steel movement than there is in making an ordinary column for a building, because pre-cast concrete blocks are used at determined section lengths (depending on the size and design) to position, and set and hold the steel rods. The wood form is built up in panels and left open at any point or those positions most desired for filling and/or inspection or puddling at (or above) the concrete line. Before a section length is filled with concrete the panels are positioned and braced; the braces are of a kind that clamp and at the same time dispense entirely with any form of scaffolding. The exterior of the wood form makes a kind of single or double stepladder for the workmen to climb up and down at the same time.

Some of the interesting features of this process are: (*a*) the foundation is made first; it need not necessarily be made at the time the pole is being cast; (*b*) the wood form need not be completed on all sides, there need only be sufficient to position and raise the reinforcement and provide for staying;





CONCRETE POLES FOR OVERHEAD LINES.

SOME idea of the complexity of the processes required for the manufacture of concrete poles by existing methods can be gained from these pictures, which show (left) forms for making poles at the plant of the Rochester Gas and Electric Co.; the reinforcing rods and cores are seen in place ready for the addition of the concrete; and (right) a concrete pole spinning machine used by the Westinghouse Electric and Manufacturing Co., Milwaukee. In the accompanying article Mr. W. T. Taylor advocates a system which eliminates these factory processes.

Digitized by Google

(*c*) the wood form is stayed in its vertical position from the time of its assembly to the time the concrete is sufficiently hardened. The little extra time and tackle taken in raising the materials (steel or concrete or partly-built wood form, in their respective operations referred to) are well justified; more so than the process of raising members of steel towers in the air which involve very much more detailed work and more handling of materials, etc., as compared with an equally strong reinforced concrete frame (double pole); (*d*) differing from a pole cast horizontally with only a total overall depth of a few inches of concrete, the plastic mass is (by the vertical method) under pressure due to the vertical concrete weight that tends to provide a relatively higher quality concrete of a greater density and strength, in that section of the pole where the greater strength and density are most required; (*e*) the electricity supply undertaking obtains the greatest, most economical, and resistant mass of concrete for the least cost because the maximum amount of effective materials is put into the pole, i.e., for the same money that buys a pole made differently (especially poles of the hollow type) much more effective material of greater strength figure is put into this pole; (*f*) a decreased factor of safety can be allowed not only because of the greater amount of materials most effectively and efficiently used, but also because all possible likelihood of fracture or injury is done away with.

At the present time there are design proposals for reinforced concrete poles in short sections with one or more legs per pole, which are either coupled by means of sleeves, telescoped, butt-jointed and bolted, or lap-jointed, as the case may be. There are also the various hand and machine methods for casting, different ways of casting and curing and storing, as well as different methods of handling, transporting, hauling, and erecting. There is no reason why we should not adopt one or other of the best-known types of poles or structures now used in the form of wood or steel; whatever type and method and design we adopt, we cannot help our attention (on the one hand) being specially drawn to the excessive costs of handling, transport, haulage and erection, then (on the other hand) to the relative maximum strength and life of the pole for a given cost.

There is little need to concern ourselves with the cost of casting or making reinforced concrete poles, except that the works-made pole requires a costly machine in the first place, and it involves high maintenance costs for the series of operations from casting to storing. Most electricity supply undertakings may be seriously concerned with the type of design and manner of making, because these spell either long or short life, decreased or increased strength, or/and higher or lower maintenance cost with age, etc. Every operation of handling at works, transporting, haulage and erection, may well be the cause of fracture or failure, and many of these fractures may (and can) be covered over, and thus pass notice. Moreover, just as we avoid joints of almost any kind from electrical or/and mechanical reasons, so we should avoid (and always look upon as a point of hazard and added cost) any form of joint placed in the main column of a pole.

Pole joints can be made strong at a relatively greater cost, but there is usually involved an additional maintenance cost as well as a risk. The risk may be great and the maintenance cost may be high; the latter would be due to the fact that there is usually nothing else to maintain in a concrete pole, and to attend to this one item of maintenance cost is obviously relatively high, and is a disadvantage.

A Satisfactory Business Proposition.

The following tabulated figures of calculated designs and estimated costs are given in sufficient detail to serve as reliable proof to engineers that the reinforced concrete pole line is a satisfactory business proposition at this juncture of electrical development. The five examples are typical of the more general practice; they are based on present-day regulation loading conditions. The first three designs for 0·05 to 0·10 sq. in. copper conductors are well suited to line voltages ranging from 3 300 to 15 000, with the costs specially favouring those voltages at and below 11 000; for the bigger lines of two-pole design using suspension insulators and 0·15 or 0·20 sq. in. copper conductors, two designs are given which will be found suitable for line voltages ranging from 15 000 to 33 000, the costs specially favouring those lines operating at and below 25 000 V. In the designs given here, it will be noted that robustness, strength, ample height and clearances, etc., have not been skimped in order to show a cheap design—*the designs are for our future lines*, and not for any purpose of presenting a cheap thing. All the designs are for a *three*-wire line.

The tabulated figures give the first costs which, for concrete poles, are the only serious costs to consider, because the annual expenses are almost all due to the interest on the initial expenditure *plus* the depreciation annuity of the remainder of the line, which latter also favours concrete construction.

Therefore, what nearly every engineer is chiefly concerned with is the first cost *of the line*—not the relative costs of wood and concrete *poles*. For a given length of transmission the concrete pole *line* has fewer poles, less cross arms and hardware, less insulators and pins, less expenses for wayleaves, etc. Hence, it is inaccurate to refer to the relative initial cost of *poles*. The maintenance expenses of wood and concrete, or steel and concrete, are out of all proportional, as also is the relative life and the relative possible interruptions in service, etc., all favouring the concrete pole line as compared with the wood or the steel pole line. Referring to the relative costs of poles is bad, but not so bad as speaking of a factor of safety of 2·5 for bare, exposed, unprotected and unsupported steel, and 3·5 for totally covered and protected and supported steel, or, that concrete should have the same factor as steel.

CALCULATIONS FOR REINFORCED CONCRETE POLE LINES.

(Based on the present factor of safety of 3·5, which combined factor is more costly and less accurate than 2·5 for steel and 4·5 for concrete.)

Labour, including cost of labour for transporting wood forms and equipment from pole to pole and of other materials from nearest railway station to respective sites	710	852	745	906	725	845	920	1105	1000	1200	1s. 2d. per hour
Transport of materials from railway station to pole site ..	10·9	273	11·8	295	11·4	285	162	405	17·4	436	25s. per ton
Overhead expenses [	15·3	295	16·3	315	16·0	308	23	443	24·4	470	19s. per cu. yd. of concrete
Cost per Mile of Line, excluding conductor and insulators, which the electricity supply undertaking may already have in stores and desire to erect themselves	3 023s. £151 3s.		3 363s. £168 3s.		3 162s.† £158 2s.		4 386s. £219 6s.		4 730s. £236 10s.		

†This price is slightly less than the next smaller standard size of copper conductor due to the fact that the spans are longer, which results in a smaller total number of poles per mile of line.

(*a*) Item for materials quantity, given in respective units and mentioned in the unit price column.

(*b*) Item for materials cost, given in shillings.

The *overhead expenses* are reduced to costs per cu. yd. of concrete in place, and include insurance, depreciation on equipment, supervising, miscellaneous supplies, travelling expenses and contingencies. These expenses, as also the unit prices given above, are considered quite reasonable. The quantities are accurate for the calculated loadings and designs proposed by the writer. Hence, the above figures of costs given here are reliable and are sufficiently detailed for engineers to check and compare with their existing wood and/or steel pole lines.

The above should serve as convincing proof that the concrete pole line is indeed much cheaper in the long run than the wood or steel pole line, when made as proposed herein. The veracity of these figures, which give actual costs free from contractors' profits, should also help to convince the engineer of the great advantages of this construction.

(*To be continued*).

BOOK REVIEW.

Vibration Problems in Engineering. By S. Timóhenko. (London: Constable and Co.). Pp. 351. 21s. net.

Like the repeated dropping of water which wears away the stone, the effect of vibration is cumulative and little understood, though its importance is growing with increased size and velocity of the modern machine. Such problems as the balancing of machines, the torsional vibration of shafts and of geared systems, the vibrations of turbine blades and discs, etc., can only be properly understood on the basis of the theory of vibration, without which it is not possible to design a machine in which heavy vibrations are at a minimum.

The author develops the fundamentals of the theory of vibration and illustrates their application to the solution of technical problems.

The first chapter discusses harmonic vibrations of systems with one degree of freedom. The general theory of free and forced vibration is explained, and its application to balancing machines and vibration-recording instruments is shown. The Rayleigh approximate method of investigating vibrations of more complicated systems is also discussed, and is applied to the calculation of the whirling speeds of rotating shafts of variable cross-section.

In Chapter II is given the theory of the non-harmonic vibration of systems with one degree of freedom. The approximate methods for investigating the free and forced vibrations of such systems are discussed, and a particular case in which the flexibility of the system varies with the time is considered in detail, the results of this theory then being applied to the investigation of vibrations in electric locomotives with side-rod drive.

Chapter III deals with systems with several degrees of freedom, giving the general theory and its application to engineering problems, and the final chapter gives the theory of vibration of elastic bodies. Problems considered include the longitudinal, torsional, and lateral vibrations of prismatical bars; the vibration of bars of variable cross-section; the vibrations of bridges, turbine blades and ship hulls; and the theory of vibration of circular rings, membranes, plates, and turbine discs. Brief descriptions of the most important vibration-recording instruments which are of use in the experimental investigation of vibration are given in an appendix.

Wave Mechanics and the New Quantum Theory. By Arthur Haas. Translated by L. W. Codd. (London: Longmans, Green and Co.) Pp. xviii+124. 7s. 6d. net.

Many electrical men who heard or have read Sir Oliver Lodge's Kelvin Lecture on the revolution in physics will have felt the desire to have a further statement of the modifications of the laws of mechanics to which he referred. Prof. Allen's treatise on "The Quantum," recently reviewed in these columns, gave an excellent analysis of the present situation with references to the work of those who in this country have contributed to the advance. The present book, by one of the clearest of modern continental writers on theoretical physics, shows how the mechanical theories of physical phenomena which had grown in a regular or classical manner around the idea of continuity of action during the last century, have been expanded by acceptance of the conception of sudden changes of energy in quanta with a new field of thought. It is based on a course of lectures given in Vienna during the winter 1927–8, and each of its sixteen chapters contains, it would appear, the substance of one lecture, the whole forming a connected argument. He explains briefly how each new movement began. Wave mechanics with de Broglie's conception that the ultimate particles move with an undulatory motion, followed by Schrödinger's attempt to generalise mechanics on this basis in the same way that Huygens modified Fermat's principle. The contribution of Heisenberg to the quantum theory is to keep it on the level of measurable quantities so that its consequences may be checked by observation. Born and Jordan have shown how this can be done using the matrix theory known to mathematicians for more than half a century, but not hitherto applied to physics. Heisenberg's and Schrödinger's theories are connected by certain mathematical transformations, and are not independent. The physical meaning of the stage then reached is examined, and Pauli's principle of the restriction of quantum numbers of two electrons in a single atom is stated, leading to an explanation of the Periodic Law. The statistical matrix treatment was extended by Fermi, and in this country by Dirac, to consideration of quanta in general, and the bearing of their results is given on the kinetic theory of gases, and as a consequence, the behaviour of free electrons in metals. There is a reference to recent advances in spectroscopy, and the book closes with a note on the possible bearing of the new generalisation on philosophy.

It is a model framework of a course of lectures, the style easy and convincing, and the translation is excellent. By omission of many of the physical illustrations and consequences it gains in logical treatment what it loses in scope. The author, in his introduction, states that it would be easy to write a book of 1 000 pages on the work of the last few years. A knowledge of the subjects discussed, as far as they are here taken, would bring the reading of the original papers which are now appearing on every branch of fundamental mechanics within the range of the serious students of physics.

OVERHEAD LINE PROBLEMS.

Questions Discussed at Paris Conference—Calculating Torsion Strains—The Use of Concrete Poles—Inspection of Wood Posts.

By THEODORE RICH, A.M.I.E.E.

DURING the recent International Conference held in Paris on Large Electric Systems a number of questions relating to overhead line practice came up for discussion. Some of the more interesting are here grouped together under the generic heading "Overhead Line Problems."

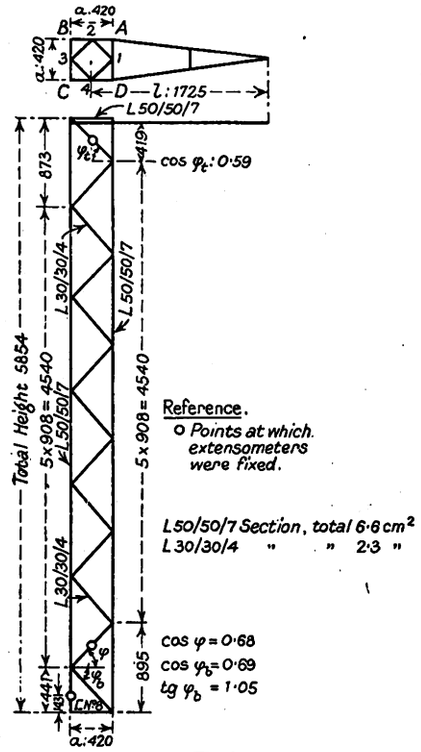

Fig. 1.

A report was presented by G. Sulzberger, of the Swiss Federal Railways, and B. Jobin, engineer, of Basle, on the calculation of torsion strains on towers. The development of transmission lines of large capacity makes it necessary to adopt higher and higher voltages with conductors of increasing diameter. For economic reasons very long spans are being adopted, and the question is whether the methods of calculation of tower strains have made equivalent progress.

Under normal circumstances the strains due to the conductor are balanced, but this is not the case where unequal spans are concerned or where irregular loading or conductor breakage takes place; while this last factor is of rare occurrence it should be taken into consideration.

The use of very high tensions and long spans involves an increased spacing of the conductors, and therefore an increased length, and torsion strains on supporting brackets. Such strains are therefore far from being negligible.

During line erection, towers can be subject to material torsion strains, the neglect of which has at times led to damage, if not to destruction. In view of these factors the problem has been studied mathematically, and tests have been made in Switzerland, especially as a result of the report of M. Labbé made to the 1927 High Tension Congress on an accident to a tower due to torsion strains during the erection of the conductor, and to the results of ideas put forward by M. Perrochet at the same time.

The effect of torsion applied to the extremities of a horizontally braced bracket on the members of a tower of rectangular section with and without diamond internal stiffening is studied. Towers are usually designed to resist a cross wind on the conductor, together with wind stress on the tower itself; this latter stress is maximum at the base and diminishes to zero at the top. The torsion stresses which are applied at the height of the brackets are often greater than those due to wind. Accidents due to torsion are usually due to deformation of cross-bracing a little below the brackets. The introduction of torsion into the calculation of towers is one that of necessity makes towards the increase in weight of construction; the importance of torsion must not be abused, as then the result would have a disastrous effect on the capital cost of lines.

Forthcoming Swiss Tower Regulations.

The Swiss regulations which are being drafted show progress on those previously adopted in the recognition of this factor, and they will state in a precise manner which towers must be calculated for torsion, and the extent of the forces to be allowed for.

The regulations will take into consideration lines of two categories: those with spans up to 50 metres (usually wood post lines), and those above 50 metres; only the second of which are of importance regarding this question. The lines above 50 metres are calculated: (*a*) with towers or supports which hold up the line calculated for the normal stresses which present themselves, and a certain number of anchor supports calculated to take into account broken conductors, so as to prevent the injury of long lengths of line; and (*b*) lines without anchor towers calculated not merely to hold up the line but also to deal with possible conductor breakage. The regulations take into account angle towers and towers for line end anchorage.

The anchor towers and the line towers in this latter section have to be calculated to resist with a certain security the torsion strains under the most unfavourable conditions which can result from the breakage of a conductor. The longest arm and the longest conductor have to be considered, although in the case of towers with a pyramidal elevation the greatest strain may come with the breakage of a topmost conductor where the tower section is at a minimum in overall dimensions.

A unilateral pull has to be considered at 0 deg. C. with an overload of snow uniformly distributed of 2 kg. per metre run for cable conductors, and 1·5 kg. for solid wires.

The following factors can be taken into account:—The reduction in load due to the altered inclination of the insulator chain on conductor breakage; the staying effect due to the presence of other conductors fixed more or less rigidly to the towers (one assumes that these other conductors remain intact and that they tend to balance under the effect of deformations); also no calculation is made for the shock which can take place at the moment of breakage, the results of which are difficult to calculate. In cases of torsion stress the load admissible for the metal of the tower is fixed at 0·45% of the breaking strain, a factor of safety of about 2·2. These prescriptions do not suppose the simultaneous operation of the torsion with other external forces such as wind or surcharges on the unbroken conductors.

Studying the Effect of Torsion.

In order to study the effect of torsion on a tower the Swiss Federal Railways, the Telegraph Department and the Government Department of Railways in Switzerland joined together and conducted tests at Ostermundigen, near Berne, in 1927.

The model tower was made by the Swiss Federal Railways Department, the movements and strains on certain members were measured by instruments of precision lent by the Swiss Ponts et Chaussées department, which administration also sent two of its engineers to assist. The design of the model tower is shown in Fig. 1, which gives the lines of centre of gravity of the sections; the tower, 5·826 metres (about 19 ft. 1 in.) high, was supported on a block of concrete not liable to material movement, a scaffolding being arranged all

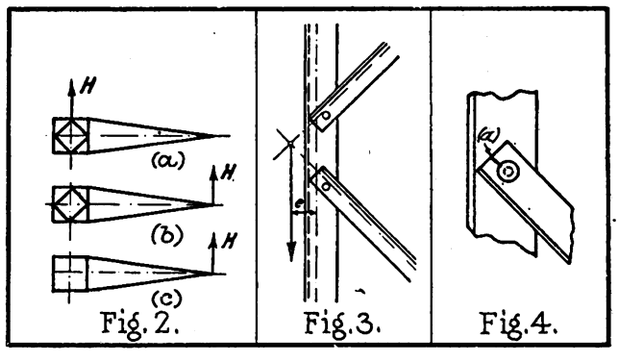

Fig. 2. Fig. 3. Fig. 4.

round the tower entirely independent of it. The tower was made up of angles 50 × 50 × 7 mm. (1·97 × 1·97 × 0·27 in.), and 30 × 30 × 4 mm. (1·18 × 1·18 × 0·15 m.). Three series of tests were made: (1) unilateral pull on the axis of the tower with loading 1 to 1 000 kg., Fig. 2A; (2) pull on the end of an arm of 0 to 625 kg. at a radius of 1·725 metres with diamond-braced tower, Fig. 2B; and a similar pull at a similar displacement on the tower without diamond horizontal cross-bracing, Fig. 2C.

For the purposes of measuring the load a dynamometer was placed in the traction wire rope, which was hauled by a

Digitized by Google

winch. To measure the fatigue on the metal sections Okhuisen extensometers were used on each bar of the top cross bracing, the four cross braces at the base, and at two opposing points on the uprights, 145 mm. from the base. The inclination taken by each bar of the bracket framework and at the base, and the displacement and rotation of the tower were measured by precision instruments.

The results of tests 1 and 2 (with diamond internal bracing, correspond closely with those calculated. Test 3, however, gave results differing in a large measure from those calculated; material inequalities of stress were met with which the customary calculations do not take into account. It is desirable at the points of zig-zag bracing to make the two converging members meet at one rivet only. The use of two with a gap between, as in Fig. 3, involves undesirable bending strains. Where possible, gussets should be adopted for joining members.

During one of the tests the tower collapsed with a load of only 60% of that for which it was designed, through the failure of a diagonal brace, the rivet tearing the angle, Fig. 4, due probably to a fault in the angle plate end. This draws the attention of steel work constructors to dangers which may result from normal (structural) works procedure through the use of machine shears and punching machines, especially when the tool edges used have been subjected to a certain amount of wear Such methods are destructive to metals, as tending towards alteration of structure and breakage. One can well ask whether the use of such methods should not be forbidden in specifications.

With towers the use of gussets is generally avoided, but the tests show the advantages which would ensue if two rivets could be used for the joining of each element, as the safety would thereby be greatly increased; gussets are, however, useful under compression; where electric welding is used, care should be taken to see that the welding points are sufficiently spread.

In conclusion, the framework to which brackets are fixed should be stiffened up, a matter of small expense; the increased rigidity ensuring the almost uniform division of the strain on the four sides. The calculation then becomes easier. It seems to be also desirable to stiffen up the framework between the base and brackets—often a distance of 15 to 20 metres—by one or more horizontal frames. Some makers recommend that a space of 6 to 8 metres should not be exceeded between such horizontal bracing. Although not imperative, such strengthening is desirable for angle and end-anchor structures.

For large towers double cross bracing is desirable, and to minimise the loss of strength due to rivet holes it is possible to use angles with unequal depth of wing; in some cases the use of gussets involves two rivets, thus increasing the security. As the torsion loading on towers is exceptional, a factor of safety lower than the normal can therefore be adopted, namely, that of 2·2.

Greater care should be taken regarding the erection of conductors. Contractors too often insist on fastening their guide pulleys to brackets, and not to the tower structure. The pulleys are often of wood attached to insulator chains, and they often run badly, thus giving rise to prejudicial strains. Metal pulleys are recommended; aluminium pulleys would be advantageous, as they are easy to grease and to keep in order. Special care should be taken regarding erection at end-anchor and angle towers. The order in which conductors are to be fixed should be chosen in such a way that those on each side alternate. Temporary stays are often useful during erection work.

Concrete Posts.

M. R. Polack, of the Nord Lumière Company, that operates in the northern suburbs of Paris and in a rural area further north, gave a report on the use of concrete posts. The lines in the inner area at high tension are nearly all in the form of underground cable, but a material part of the h.t. distribution elsewhere is by overhead lines.

Owing to labour and other difficulties during the war, many of the old wood post lines were in a bad state. At first the work was taken in hand of replacing wood posts by wood, but the difficulties of changing them owing to the necessity for cutting off current were great. The depletion of many forests during the war raised the prices of wood posts. The appearance of combined concrete and steel pole bases saved the situation for the time being, two types, the "Forclum" and "Pallix," being adopted between 1923 and 1925; 4 000 posts were placed on concrete and steel bases of these types.

It may be noted that with the aid of prickers the post can be kept in position while the old base is cut off above the ground line, the hole excavated, the old stump end taken out, the concrete bases put in, and bolted up, and the ground put back and rammed without necessitating the cutting off of h.t. current.

At first it was thought that the problem was completely solved; after the war the more important new lines were placed on concrete posts, and for those of less importance wood posts injected with copper sulphate were placed on concrete supports. Later wood posts creosoted with 200 litres of creosote per cu. m. of wood were used, and between 1925 and 1928 270 km. of line was erected with concrete posts, and 170 km. with creosoted wood posts.

Two new lines at 60 000 V were put up with concrete posts, one 40·5 km. long to serve Beauvais, set to work in 1927, and one of 55 km. set to work in February this year, arranged to link up with existing lines. The latter line has posts with concrete brackets, no steel towers being used.

Since 1926 the use of pole bases has been recognised, not as a definite solution, but as a very useful means of line repair, but the deterioration when already started with the wood posts tended to continue, although the life was prolonged for some years; the definite replacement of old worn-out poles was only deferred, therefore, for an average of four years. It was found necessary by the operating department to arrange for skilled foremen to examine the wood posts on 15 000 V lines once a month, a matter of great expense. The complete replacement of posts was also a costly thing, and it was difficult to be certain of the condition of wood posts. Moreover, urgent replacements were a great trouble, the cost of replacing a post on an existing line being at least double that of the putting up of one for a new line.

Why Concrete was Chosen.

To diminish such troubles, regular examination and borings were adopted, but even then there was no certainty. In a great storm in November, 1928, fourteen posts were broken, eight of which had been passed as sound. In view of these troubles it was decided to replace all the wood posts by supports of a character which would not depreciate in strength. Armoured concrete was adopted in preference to steel, as it was considered desirable to avoid the necessity for painting supports. It was desirable, therefore, to replace progressively a certain number of wood posts scattered all over the supply area. A usual method of manufacture of concrete posts is to make them at temporary construction depots at convenient centres. Such a system does not lend itself when the sites of planting are scattered as when replacements are required, although it is useful when large numbers are required in a given area. It was decided, therefore, to use light concrete posts constructed in a factory, the low weight facilitating transport.

A careful study was made of each line to be reconstructed, so as to minimise any operation difficulties in the future. The lines were repegged out, alignments were improved, especially by crossings over private properties, which often enables spans to be increased and upkeep costs to be reduced. From 1926 to 1928 two thousand wood posts were replaced, and this work is continuing. After about 1930 there will remain on the 15 000 V system 30 km. of line with posts which were originally placed on bases and 170 km. of creosoted posts which will give a certain number of years of life without too much upkeep.

Regarding low tension (about 115 V to earth mainly), study has shown that lower upkeep costs will largely make up for the increased first cost of concrete over wood; with concrete posts there are certain difficulties regarding spans and branches (long spans are not convenient in many cases owing to the necessity for tappings to houses). All the same, a certain number of new l.t. lines have been constructed with concrete posts; in 1928 31 km. of such line were constructed. The spans inside villages were increased from 50 to 55 metres, and outside 50 to 80 metres. According to the French regulations no factor of safety is laid down for low tension work, but for design a factor of safety of about 2 on the breaking strain was adopted. (The normal French regulations are for about 15 lb. per sq. ft. on projected conductor area and about 24 lb. per sq. ft. on flat surfaces with no ice loading.) This arrangement has proved to be perfectly satisfactory. The cost of a line constructed with concrete posts as compared with wood posts treated with copper sulphate is as 1·20 to 1·25; these figures have been accepted as a basis by local rating authorities. The upkeep expenses saved, judging by experience of the sections in operation, can be taken as 1 800

Digitized by Google

frs. per km. (about £22 10s. per mile) per year; it has been decided, therefore, gradually to replace wood for l.t. lines by concrete as occasion arises. For such duty light centrifugal poles are preferred, as they have the same resistance to bending in all directions, a matter of importance regarding overhead tappings; completely to reconstruct the l.t. overhead system with concrete posts will take five to six years, and will require 7 000 to 8 000 posts.

Centrifugal posts have been satisfactory, especially for low tension work. Concrete posts in general have given good results, even when the line has been subject to very violent winds. Only the falling of trees or branches has given rise to trouble under such circumstances.

During the last ten years experience with at least ten different types of concrete posts, differing in calculation, materials, manufacturing methods and supervision shows the necessity for placing orders not merely with firms of material standing, but with undertakings with great experience in this class of work.

The life of well-made concrete posts cannot be estimated with certainty, as sufficient length of time has not yet elapsed. Badly made posts give signs of cracks and rust marks at an early date, whereas other types have remained intact after years of use. Posts of the centrifugal type give very good prospects of resistance to atmospheric and other attacks, owing to the hard surface and homogeneous nature of the material used.

Posts Cast on Site.

Senor de Vinuesa (Spain) said that his company had erected over 600 km. of concrete post line for 70 000 V with 200 metres span. The posts are 14·5 metres high and 1¼ tons in weight. They are cast on site, alongside the hole. There are three conductors, each 60 sq. mm. section of aluminium steel. Last year, from May to October, 97 km. of line had been erected. Owing to wayleave difficulties, there had been certain delays in getting wayleaves, and to save time Ciment Fondu had been used. It was then found possible to erect the pole three days after casting. In very hot weather it was desirable, either not to cast, or to cover up the post after casting to prevent cracking. The upkeep costs since 1920 had been nil. The cost had been 27 000 frs. per km., or about £360 a mile.

Mr. Bornquist of Sweden, during the discussion, said there was a tendency to consider the economic life of a line to be longer than it really is. Supposing that the life of a concrete post could be taken as 40 or 50 years, the question was whether, after 20 or 25 years, the conditions had not changed, and whether after that time it would not be best entirely to rebuild a line.

Regarding wood posts, it was essential that inspection should be systematised. He adopted examination every three years. With 200 litres of creosote per metric cube of wood the life of a wood post should be about 25 years. Some difficulties had been experienced with concrete posts when the foundations were in rock, especially with centrifugal posts. M. Ferrier stated that the mistake often made regarding the foundations of ferro-concrete posts in rock was to make the hole too shallow.

M. Marcotte said that a comparatively flexible form of post was being used in some parts of France. It was made up of a light deep-flange steel joist of uniform section. After allowing for increased span its use came out only about 20% dearer than wood poles. This type of post was being used on some lines for 70 metre spans with three copper conductors 3·5 mm. dia. (about No. 9 S.W.G.). It looked neat, and the erection was rapid, as only about 1/10 of a cubic metre (about 3·5 cu. ft.) of concrete was usually necessary for the foundations. Twin posts bolted together could be used when extra transverse strength was required. The section had a flange of the same width as the depth of the joist. The upkeep costs of such poles were low.

ELECTRICITY IN AGRICULTURE.*

Results of Investigations in the Rural Supply Area of the Chester Corporation—Some General Considerations on Rural Electrification.

IN Bulletin No. 5 of the Institute for Research in Agricultural Engineering, University of Oxford, Mr. C. A. Cameron Brown furnishes an interesting report of an investigation undertaken in the rural supply area of the Chester Corporation between March, 1927, and April, 1928.

In his introductory remarks the author divides the problem of rural electrification into three main heads.

(A.) To cheapen the cost of constructing the transmission and distribution system and to increase the number of consumers, thus lowering the overhead charges to be met by the consumer connected to the system.

(B.) To encourage a liberal use of electricity for all suitable purposes by each consumer, in order to keep the average cost per unit consumed at a reasonable figure: at the same time to ensure that this use is of economic value to the consumer.

(C.) To secure as far as may be possible a steady and regular use of electricity by rural consumers.

It is pointed out that on the one hand the farmer will not use electricity unless he is convinced that it will afford him a cheaper form of power than he has otherwise at his disposal, and on the other that the supply company will not offer the farmer electricity except in the hope of benefiting financially, if not immediately, at any rate in the long run. The position is thus, viewed widely, a kind of deadlock. The farmer, at present uncertain of the benefits of electricity, is chary of making a request for it; the supply company, uncertain of the farmer's ultimate potential demand, is chary of making an offer.

The Americans are seeking a way out of this impasse by erecting experimental lines into certain rural districts and running them under careful supervision.† They are also conducting a very vigorous propaganda among the farmers, showing by letterpress and illustration all that electricity may be expected to do for them, from overhead irrigation and poultry raising to curling tongs and burglar alarms.

In spite, however, of the work which is being done in America and elsewhere abroad, it is difficult to get much definite information as to the demand likely to be made by rural districts; it is still more difficult to get detailed figures as to the individual power demands of the various operations that go to make up the activity of the farm. It is only by a study of the latter that either the farmer or the supply company can be furnished with the information of which they are respectively in need.

The report gives the results of such a study, conducted in the Chester area, on eight farms using electricity.

Permission was obtained for an observer to visit eight farms daily over a complete year. The Corporation Electricity Department assisted by separating as far as possible the various circuits in each farm and installing separate meters. One farm, for instance, was fitted with seven meters.

The main points which it was proposed to investigate were:

I.

(*a*) What amount of electricity is used by an average farm and how far this amount varies according to season.

(*b*) What proportion of the total amount is used respectively for domestic and for farm purposes, and

(*c*) How the latter is divided among the various farm operations.

II.

As regards purely farm operations

(*a*) What is the consumption required for each operation.

(*b*) What power and what size of motor does each operation require.

(*c*) How far the cost of an operation is affected by performing it at different speeds of working.

For the above purposes detailed tests were made from time to time. The quantity of material treated was accurately weighed and the power required was ascertained by special

Digitized by Google

meters fitted to each motor ; a recording watt-meter, with the chart running at 6 in. per hour, was used in addition. The duration of the operation was also noted. The results obtained are given in Tables in the report.

III.

How does the farm load vary during the day ; in other words, what are the conditions which the supply has to meet ?

For this purpose an Evershed and Vignoles recording watt-meter was placed at each farm in turn for a week, during the period of winter high load. With the chart running at a low speed (1 in. per hour) a record was obtained of the load of each farm for a week. It was found impracticable to extend these observations to more than a week on each farm, but as the work on a farm is carried out more or less regularly, one week's chart may be regarded as fairly representative. In most cases there was found to be a regular repetition of daily conditions within the week. A second record at a higher speed (6 in. per hour) was obtained of the load of each farm for a day—the day on which observations were made for the purpose of II above.

In discussing the results of the investigation the predominance of the domestic load is very marked. In six farms the domestic consumption is greater than the farmyard consumption. In the remaining two farms the low proportion of the domestic consumption is easily accounted for.

It is evident that, provided the domestic equipment is proportionate to the standard of the farm, the most important load is that of the house.

Cost of Working and Power Required.

1. *Thrashing.*—Only two farms were available for these observations.

The average of 0·59 and 0·76 unit per cwt. might be taken as a basis for estimating possible consumptions. This works out at 0·68 unit per cwt. of grain thrashed. The average yield of oats, barley, and wheat is 18·6 cwt. of grain per acre. Thrashing this will require $(18{\cdot}6 \times 0{\cdot}68) = 12{\cdot}7$ units per acre under grain.

2. *Grinding.*—The conditions of working—rate and cost—vary tremendously with the degree of grinding : the coarser grinding can be done faster and more cheaply than the finer grinding. In this and in the following applications the consumption in any one farm will depend on the number of stock and the methods of feeding.

3. *Crushing.*—Only two farms were available for these observations.

4. *Chaff-cutting.*—The machine at Farm No. 1 was much larger than the others, and owing to its high rate of working the cost was considerably lower than for the other machines. The power required to drive it was naturally greater.

5. *Cake-breaking.*—This is a very small operation : the cost varies from 0·04 unit to 0·14 unit per cwt.

6. *Root-cutting.*—This is also a small operation : the cost varies from 0·30 unit to 0·89 unit per ton.

7. *Silage-cutting and Silo-filling.*—Grass provided a more difficult load than beans, peas, and oats, the rate of working being much lower and the cost considerably higher.

8. *Pumping.*—The cost and rate of pumping depends so much on the conditions, sizes, and lengths of piping, etc., that the figures given cannot be taken as strictly representative.

Effect of Rate of Working on Cost.

It was not found practicable to carry out any special runs to investigate this, and the observations had to be made as part of the detailed tests. These show in general that when the rate of working is increased, increased power is necessary, but, at the same time, the cost of working is decreased.

Grinding presents difficulties, because of variations of quality as well as speed of grinding. Where, however, the degree of grinding is kept the same, faster working lowers the cost. This has been seen to apply to all the operations ; within the limits of power available, the operation is done most cheaply when carried out at the maximum rate.

The Power Used.

In most cases the motors used for barn power were larger than was necessary—an important point where the tariff includes a quarterly charge of 2s. 6d. per H.P. connected.

Large motors, rated at much over maximum load, are necessary if the voltage regulation is bad. In such circumstances it would be a convenience if arrangements existed for the temporary hire of motors. The hired motor could be replaced by a permanent motor when the line became normal.

Taking everything into account there does not appear to be any need for a specially designed motor for agricultural barn power purposes ; standard motors satisfy requirements. For outdoor work specially weatherproof motors are necessary.

The idea that, for rural supply, reliability and continuity of service is not of primary importance is emphatically wrong. Such farms, in particular, as those with milk treating plants, milking machines, etc., depend for their success on unfailing power supply. Farm No. 7 has to retain an oil engine on account of this possibility of failure. During the year of observations, while there was no failure at the source of supply, an interruption was caused by trees being blown across the lines during a gale.

Part II of the report is devoted to a general consideration of the present possibilities of rural electrification, and deals in some detail with the appropriate conditions. In the conclusion it is stated that the observations are based on costs of construction which would appear to be obtainable at the present time, and the assumption has been made that the scheme is tackled as a whole and the work carried out comprehensively and consecutively.

Assisted Purchase of Equipment.

It is also taken for granted that the majority of the premises will be connected up to the lines, and it is pointed out that this latter condition can only be attained if there is some scheme of help to purchase equipment.

Not only does this apply to domestic equipment but to farm-power equipment as well. The farm may be well equipped with oil or other engines, and no matter what saving in running cost is in prospect, the farmer is unlikely to be able or willing to scrap his existing plant and buy electrical plant unless he is offered very easy terms of purchase.

In arranging the details of such a scheme it might be best to arrange for payments which increase year by year. The farmer would, in any case, have been called upon to pay increasing amounts every year for repairs and upkeep of the plant which he has now scrapped. During the earlier years he will be in a position to appreciate savings in running costs, and with the lighter initial payments he will not be hampered in effecting any improvements in operation which his experience of the first year's working may suggest.

The same considerations would apply to hire-purchase arrangements for domestic equipment.

A consumption at the rate of 129 units per head of population is not an unreasonable estimate. Such a rate would result in reasonable charges per unit to the consumer, and should be realisable soon after the system was put into operation.

It is added that the fuller estimate of 183 units per head of population should be realised later, when the advantages of electrical usage have been demonstrated.

But demonstration in the truest sense of the word is absolutely essential. Advertisement and verbal propaganda, useful though they may be, are not of themselves enough. However reasonable the prices offered may be, the appeal must be to facts and not to argument. The facts must be the facts of every day, not the facts of the staged display of the showground. If the bulk of rural dwellers, not merely the luxury user, are to be won, they must be convinced by the nearest possible approach to ocular demonstration under conditions resembling those of their own daily life, that electricity, in any given application, regard being had to its cleanliness, its convenience, and its dependability, is definitely and decisively cheaper than previously existing methods.

In any scheme of rural electrification, particularly in the early stages of development, it will be necessary to rely for revenue on the larger individual users of energy. For all that, it is urged the farmer must not be allowed to feel that he is a side-line ; the advancement of his interests must from first to last be the main aim and object. His contributions may be small at first, but they should, with proper encouragement and management, provide before long a useful return. This is without reference to the use of energy for field work. It would not be sound to reckon on this as an asset at first.

But given a rural district thoroughly electrified, the claims of electric ploughing and cultivating should not be slow to gain recognition. Contractors will be able to equip themselves with electric tackle knowing that a supply of electricity will be available wherever they may have to work. It is pointed out that if 10% of the hypothetical area—20 square miles, or 12 800 acres—were ploughed once over every year by electric power at a consumption of 30 units per acre, the revenue, at one penny per unit, from this operation alone would be £1 600. This may seem but a modest contribution ; but it will be a beginning, and that beginning once made, the use of electricity for other purposes of cultivation should extend.

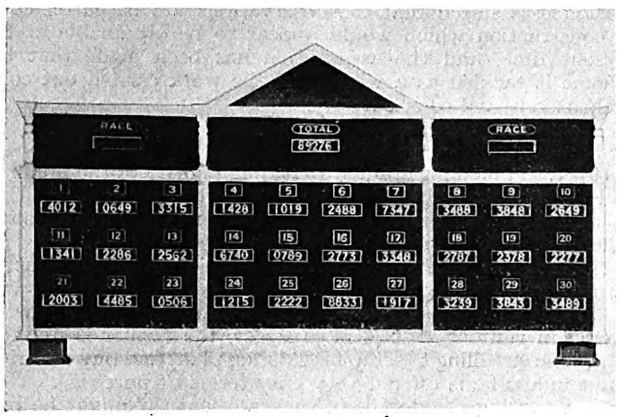
ELECTRICITY AND THE "TOTE."

Some Further Constructional and Operating Details of Equipment for British Racecourses—Indicating Mechanism—Probable Future Developments.

By D H. N. CALEY.

(*Concluded from page 73.*)

ALL-ELECTRIC operation has been chosen for the totalisators produced by The British Automatic Totalisator, Ltd., of Plant House, Longfield Avenue, Ealing, and 82, Victoria Street, London, S.W.1. When this firm was interviewed by the writer, orders had been received to supply eight courses, five of the orders being for complete, permanent installations,



Indicator board of a Lightning Totalisator (win section for 30 horses) built in England prior to the issue of the Control Board's specification.

and the remaining three for skeleton installations. In skeleton installations the framework and other necessarily fixed parts only are permanent, and all other parts are transferred from course to course. By making use of the skeleton system in suitable instances, the Racing Betting Control Board is able to save a considerable amount of capital expenditure.

The ticket machine has a keyboard with a key for each horse number and two selector keys for win and place. The keys are interlocked, so that only one can be pressed at a time; a further lock prevents a key from being returned until the ticket is issued. The printing section consists of a horse number drum, and a printing roller which provides for the general details. The printing type is supplied with ink from felt rollers covering ink cylinders. The machine is motor-driven with motors and reduction gear fitted in the base, which also accommodates the paper roller. The horse number drum is driven through a friction drive.

Escapement Mechanism.

The adding machines consist of six parts per digit, viz., commutator and collector, escapement coil, friction clutch, contact cylinder, stationary contacts, and transfer switch. The commutator is provided with a series of insulated contacts which are connected to the switch lines from tickets of one value. These contacts are traversed by a radial collector brush which rotates constantly during the operation of the totalisator. The collector brush is connected to one terminal of the escapement coil. The escapement coil operates a check-and-release device which engages with an escapement mechanism attached to the "contact cylinder." The contact cylinder has a series of studs suitably arranged to engage with the "stationary contacts" when the cylinder rotates. The stationary contacts are connected to lamps on the indicators.

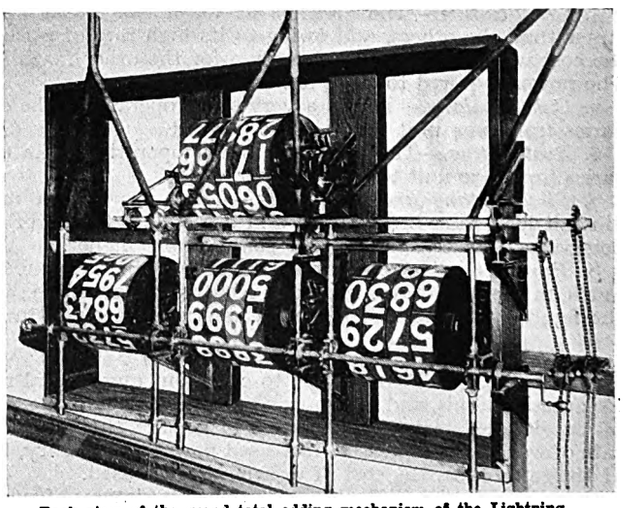
When current passes from the ticket machine end of a selector line to the segment on the corresponding commutator, the rotating brush engages with the live contact, and thus closes a circuit through the escapement coil. The energised coil then releases the escapement, which permits the contact cylinder to turn under the action of the friction clutch. The indicators in the British Automatic Totalisator, as was previously stated, are of the monogram type, and the lamps are thus selected by means of the contact cylinder in a manner similar to that used in a "spelling" monographic electric sign. The mechanism, including collector brush and escapement, takes the place of the solenoids, ratchets and pre-selectors of the Hamilton Totalisator. The object of the transfer switch is to close a circuit on the commutator of the next highest denomination, so that the figure 1 in the tens column of the indicator may be illuminated immediately the 9 in the units column becomes out of date, and so on.

In the groups dealing with horse totals, the selector lines from one ticket machine are connected in a symmetrical position on all commutators of the same denomination. All selector brushes are set at the same angle on the driving shaft, so that it is only possible to obtain one impulse at a time over all commutators of one value. The grand total escapement coil is connected in the main circuit, in series with the horse escapements.

Another special feature of this totalisator is the semi-translucent screen which covers the indicator lamps. As the base behind the lamp pockets is black, the screen normally shows a black front, but when a lamp is illuminated, the screen effect is destroyed, and white spaces upon a black background are displayed. This translucent screen should be a valuable advantage on days when the light keeps changing, as well as when the indicator is directly in the sun.

The Super Totalisator.

A good idea of probable future developments of the "Tote" is given by the Hamilton "Super Totalisator," already invented by Mr. R. M. Hamilton, of Graham Amplion, Ltd. This machine cannot as yet be submitted to the public, as it does not fall within the specifications of the Control Board. The chief difference between betting with an ordinary totalisator and with a "bookie" is that with the "Tote" system the odds which will be paid if the backed horse wins are not exactly known at the time of betting; the gambler does not know just how great is the risk he is taking. If, with the standard totalisator, it is desired to know what are the odds against any horse at the moment, it is necessary first to deduct from the pool the percentage charged by the machine, then to deduct the number of bets on the horse in question from the remainder obtained by the first operation, and finally to divide the new remainder by the number of bets on the horse. This process is so tiresome that in practice the racegoer does not attempt it, and, instead, racing slips showing the approximate current odds are sold at frequent intervals. The



Back view of the grand total adding mechanism of the Lightning Automatic Totalisator, showing drum type indicator.

Hamilton Super Totalisator overcomes this drawback by itself calculating and displaying the instantaneous odds in the same form as they are offered by a "bookie." Thus it is claimed to combine the accuracy and honesty of a totalisator with the mathematical method of a bookmaker. With this improved machine a conclusive bargain can be struck by a backer at any time before the race, with no risk of the odds changing—as they may change considerably with a "Tote" that simply integrates—before the starting price is reached. The odds can be fixed by having them stamped on the ticket, either at the time of making the bet or at any moment when they appear to the backer to be favourable to him. In this way the Super Totalisator should tend to eliminate the rush to the windows just before a race starts.

Digitized by Google

The operations which have to be performed by the calculating mechanism may be indicated by the following example: If at a given moment during betting the odds shown against any selected horse are 10 to 1, and there have been, say, ten bets made on that horse, it follows that, after deducting the percentage, there are 100 bets on all the other horses in the race. If the ticket is endorsed at 10 to 1, then ten of the bets are ear-marked to pay the bet if the chosen horse wins. This ear-marking leaves 90 bets on the other horses and nine on the selected horse—i.e., the odds are unchanged at 10 to 1 for the other nine bets. The machine has to subtract the stake value of each ticket stamped from the total amount of money on the horse, and to subtract from the pool an amount equal to the odds multiplied by the stakes of those stamped tickets. If the horse loses, an ear-marked or stamped bet goes to pay the winner in the same way as if it had not been stamped.

Disconnecting Switches.

The possibility that at the beginning of betting there may be shown against certain horses freak odds, which would not if stamped on the tickets represent in any way the probability of the horses winning, is eliminated by the provision of a switch which disconnects all the stamping machines until the pool has reached a predetermined number of units. A further protection against freak results is obtained by constructing the stamping machines not to give longer odds than 20 to 1, which limit is thought to cater for all reasonable requirements. It should be realised here that this limitation on the stamping machines does not affect the odds payable on a winner; the indicator shows up to 1 000 to 1, but all bets over 20 to 1 must be paid at starting price. It may be noted that as the final position of the indicator is the starting price all delay in declaring a dividend is obviated. Considerable extra time for betting is thus allowed between races; to facilitate rapid return to business a switch is closed to energise a circuit connected to all the stamping-drum motors, so that they may run together until the drums have returned to the zero position, when the circuit is broken—the whole system being reset to zero in approximately 40 seconds.

In the Super "Tote" the following operations are done automatically by electrical means: Printing tickets and recording their sale. Converting totals into odds. Indicating to the public these odds. Printing the odds on the tickets. And, lastly, recording the value of the tickets and the amount to be set aside to pay them if they win. The issuing operator turns a dial to the horse number and presses a knob. The turning of the dial moves the printing wheel to the correct position, and the action of the printing sends an impulse to the collector of that horse and to the pool collecting mechanism. The operator also presses a key corresponding to the stake value to be printed on the ticket. The electro-mechanical calculating mechanism for converting the total amount of money in the pool and on the horse into odds is known as the "log conversion unit." This clever and complicated piece of apparatus, which appears to work on a somewhat similar principle to a slide rule, converts the numbers into logarithms and thus divides them out. The percentage deduction is made at the same time. The result obtained is thus identical with what would appear after performing the arithmetical operations described in the first of our paragraphs referring to the Super Totalisator.

The calculating unit controls electrically the odds indicators, of which there can be any convenient number in various parts of the enclosures. The indicating unit used resembles a gigantic thermometer, an arrow moving up and down in front of a large scale. One advantage of this construction is that the approximate odds against any horse can be seen at a considerable distance, simply by noticing the height of the arrow. A special cam mechanism, which Mr. Hamilton believes to be the first of its kind, has been invented to enable big figures to be used. It gives a range form 100 to 1 on to 1 000 to 1 against. This is achieved by having one set of nineteen ranges of odds, and so arranging arrow-form pointers on an endless chain that whenever one pointer reaches the end of its travel and disappears at the top, another pointer appears at the bottom, the scale at the same moment being moved sideways to disclose a column of noughts, thus multiplying all the odds through a 10 to 1 step. Where the indicator formerly gave figures between even money and 10 to 1, it will next show odds between 10 to 1 and 100 to 1, and so on.

The odds stamping machine is very similar to the ticket issuing machine, and is operated in the same way, but, instead of transmitting one impulse to the pool collectors, it transmits impulses representing the stake multiplied by the odds, thus deducting the appropriate sum to pay the ticket if the selected horse wins.

The portable hand-operated model of the Hamilton Super Totalisator consists structurally of a light hut which can be supported on jacks at such a height that a six-wheeled lorry can be backed underneath. The permissible width for road traffic being only 7 ft. 2 in., one side is made collapsible, and the mechanism belonging to that side is arranged so that it can be carried inside the main structure during transportation from course to course. As the best position on existing small racecourses is half way between Tattersall's and the Silver Ring, the indicator is made collapsible, so that while it may be large enough to be clearly visible from the stands before a race, it may not obstruct the view of the course during the race.

This building would be staffed by twenty-five operators. Ten are permanently engaged in issuing tickets, and fourteen are available for paying out the winners immediately after a race. As soon as the bulk of this work is finished, six of the fourteen would change from paying out to stamping the odds on the tickets just issued on the current race. Six of the remaining eight will be available for operating the calculating mechanism about to be described.

The first of the mechanical operations is to collect all moneys received and add the totals continuously. Each booth sells only tickets of a certain fixed value. Upon selling a ticket the operator inserts it into the traversing printing head, which is then moved to the appropriate horse position and the knob depressed, thus printing the date, a code word, the number of the race, and either win or place. When the printing head is depressed, it actuates a lever operating the corresponding collector element, and at the same time depresses a common bar, which moves another lever connected to the pool collecting element. This automatically effects the totalising, and indicates the totals to the calculating operator, who sets drums accordingly, which results in the arrow moving to show the odds. The movement of the arrow causes a type bar to slide under the printing heads in the stamping booths, so that when a ticket is handed by the purchaser to the stamping operator it receives upon it the odds at which the arrow is standing.

Courses Wired Permanently.

The combination type super "Tote" has been designed for moderate-sized racecourses. The course is electrically wired in a permanent manner, and the calculating units are arranged in a small fixed pavilion. The ticket issuing and bet stamping booths are similar to the types used in the portable model, but the bets collector line shaft, instead of being connected to the odds-calculating apparatus by sprockets and chains, drive electrical transmitters by which impulses are sent over the permanent wiring to the centrally located calculating units. The latter are of the hand-operated type, but the primary elements are driven electrically from collector mechanism instead of being operated directly by the printing evers, as in the portable.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

The Electric Vehicle Question.

[To the Editor.]

Sir,—I have been interested to read, from time to time, your comments on the electric vehicle question; and in particular, your hope that coming legislation will help to create a demand. Every one of us who is condemned to dwell on the sides of the inferno of a modern main road ought to lean back in his vibrating armchair and wish for the dream to come true. But, I should like, if I may, to be allowed to ask a question: *Is* anyone besides you, sir, seriously interested, and honestly desirous to produce that which is so much needed? Or have we given way to an impression that the difficulties are insuperable?

The other day I caught my first sight of England, from the South American boat approaching St. Catherine's Point and the Needles. There was nothing pointed about St. Catherine, and the Needles seemed to be in the same plight; but what impressed me most was that the whole flat expanse of England seemed to be slipping (as I believe it is) into the sea, with an expression of supreme indifference on its bland countenance.

Electrical Development in London.

[TO THE EDITOR.]

SIR,—Being in the same supply area as "A Mere Consumer," I fully endorse his remarks on the way in which the supply company concerned is preventing domestic consumers from making full use of electricity. I, too, am prevented from using an electric cooker or any other fairly heavily loaded appliances, and, apart from the inconvenience which I suffer as a consumer, I am constantly twitted by friends in more fortunately placed areas, who naturally find food for jest in the case of the electrical man who does not use electricity in his own home. However careful one may be to explain why a member of the electrical industry cannot use something which he spends all his days in persuading others to use, it is inevitable that many people will jump to the conclusion that even on a standing charge and a unit rate of 1d. per kWh, electricity is too expensive to be used by those who know.

The present case—isolated though it may be—certainly shows the superiority (from the consumer's point of view) of municipal over private enterprise in the supply of electricity. Friends living in the adjacent Croydon municipal supply area enjoy cheap electricity, and are actively encouraged to use as much of it as they can. To live so near to this Electrical Utopia and be denied the use of more than 3 kW is particularly galling to

London, S.E.26.
July 22nd.

ANOTHER CONSUMER.

[TO THE EDITOR.]

SIR,—While sympathising with "A Mere Consumer," may I suggest that the operation of the sliding scale of dividends consequent on the reduction of price from a high flat rate to the low all-in rate, will amply repay the supply company for any loss of revenue from the reduction of domestic consumers' bills for lighting. So long as this anomalous arrangement is allowed to continue, development of a complete electrical service will be prevented in areas of the kind mentioned by your correspondent.—I am, etc.,

Streatham Hill.
July 19th.

"PRO BONO."

The steam turbine, known to Nero in 60 A.D., remained unpractical until its combination with the high-speed electric generator.—*Mr. Preston S. Arkwright.*

* * *

There are those among the thoughtful in America who are wondering whether it would not be better to adopt the British system, abolish the private advertising broadcasting stations and establish a few monopoly stations financed out of licences. —*Mr. J. C. Squire.*

SOUTHERN RAILWAY ELECTRIFICATION SCHEMES.

Some Suggestions—How Erection of New Charing Cross Station could be Avoided.

By J. G. B. SAMS, A.M.Inst.Mech.E., M.Inst.Loco.E.

THE Southern Railway is certainly to be congratulated on the fact that it is not content to rest on its laurels, but is pushing out still further with its electrification schemes, and in this respect is a shining example to some of the other railway groups. The following are the sections that it is hoped will be electrified by next year:—

Sutton and Wimbledon.
Dartford and Gravesend.
Hounslow and Windsor.
Wimbledon and West Croydon.

The first is a new branch entirely, at present under construction, and the railway expect to amalgamate the service to run over this section with the existing service between Wimbledon and the City via Herne Hill, which will give Sutton the advantage of another City terminal. The Dartford and Gravesend section is an extension of the three electric routes from London via Bexley Heath, Woolwich and Sidcup, which now terminate at Dartford, and the Windsor extension continues the routes via Kew Bridge and Richmond, serving, among other stations, the important riverside town of Staines. The last section is a curious little self-contained branch, part of which was built over the track of the 100 year-old Surrey iron tramroad, which extended from the banks of the River Wandle at Wandsworth to a spot near Croydon Parish Church, where it connected with the similar tramroad to Merstham and Godstone.

The particular failing of this piece of railway is that it lacks a connection between the stations at East and West Croydon, at which latter it terminates. A short connecting line, which would not amount to a mile in length, between these two stations would be of great traffic value, as it would put the rapidly increasing population of Wimbledon, Morden and Mitcham (all having stations on the branch) into direct connection at East Croydon with the Southern main line to Brighton and Eastbourne. At present one has to walk between the two stations, which, although not far, must act as a deterrent to traffic. The proposals of the railway do not include a through service between this branch and London, which perhaps is governed by the difficulty of fitting more trains in. A through service would perhaps attract some of the traffic now passing by the Tube from Morden, which is commendable from the Southern point of view. While in this neighbourhood there is one connection that, while having a certain traffic value, as through connections must always be of advantage to some of the travelling public, would be of material operating advantage as it would abolish two terminals; and that is a short connection between the ends of the Tattenham Corner and Epsom Downs branches. In this case the writer is speaking without his book, as he has no information on the difference of levels (if any) of the two branches, which may perhaps be prohibitive; but it is certain that at peak periods such as race days it would be exceedingly convenient to serve the traffic with two circular routes in place of the two terminals, and for this reason alone the scheme might be worth consideration.

The electric service operated by the Southern between Wimbledon and Waterloo via East Putney merits a little attention. This is an hourly service (half-hourly at peaks) and to the writer's knowledge is very lightly patronised; a glance at the map will show why. But if this service could be deflected on to the District and Metropolitan Railways via Earl's Court and continued on to Liverpool Street or Aldgate it might prove of considerably enhanced value, as it would give useful through connections with the group of terminals along the Metropolitan, in place of the two changes as now. Increased traffic might justify a reduced headway between trains, which at one hour seems a little sparse for electric services.

The final suggestion is in connection with the proposed abolition of the Charing Cross terminal, and it is that the Charing Cross steam train services should be diverted to Victoria and the electric services spread over Victoria and St. Paul's terminals. This would save the erection of a new terminal on the south side of the Thames, which is certainly the wrong side of the river for about 99 per cent. of passengers, as well as bad in operating theory. This is not the awkward problem that might appear at first sight, but naturally it would require some alterations and additions to the present facilities, the chief being an enlargement of Victoria terminal to accommodate the displaced steam service.

Other work necessary would be the completion to four tracks of the road between Victoria and Nunhead Junction, part of which already has four roads, and a further part three. It is considered—and the writer has had considerable experience in terminal working—that the displaced electric services could be absorbed into the present working at Victoria and St. Paul's by closing up the existing working so that additional platform accommodation would not be required.

Critics are reminded that there is a spur line between the ex-S.E. and C. main line to Charing Cross and St. Paul's, and that the Southern are seeking powers to instal a flying junction from their main line near St. John's and to restore the derelict Greenwich branch between that junction and Nunhead, which will provide the access necessary for this scheme.

ENGLISH METHODS OF PACKING ELECTRIC COOKERS.

THE above pictures, reproduced by courtesy of the General Electric Co., show how "Magnet" cookers are packed, either singly or in pairs, for export. Figs. 1 to 4 show the former method, while Figs. 5 to 8 show the second method.

SINGLE METHOD.—(1) *Cooker dismanled ready for packing;* (2) *showing base battens fitted in extra strong wood case forming a recess into which cooker shelf is packed;* (3) *cooker in case with supporting frame of 1 in. timber fitted over hob to take weight of oven when case is turned over on end. The legs are wrapped in waterproof paper and securely packed in hot chamber underneath oven. Note rigid construction of case;* (4) *cooker packed, showing front supports. A thick felt pad is used wherever cooker comes in contact with case or battens, to prevent damage to enamel. Cases are lined with waterproof paper. Case is now ready for front lid to be fitted. The lid is lined with waterproof paper and thick felt.*

DOUBLE METHOD.—(5) *Showing base battens fitted in position, forming recess into which the two cooker shelves are packed. Enamelled splash guards and struts fitted in back and protected with felt. The case, which is of extra strong high grade wood, is rigidly braced and is lined with waterproof paper;* (6) *the two cookers in case ready for front battens to be fitted. The legs and heating elements are securely packed in the two hot chambers of the cookers. Thick felt padding is used generously where necessary. Note entire elimination of waste space;* (7) *front battens fitted. The case is now ready for lid to be fitted. The lid is also lined with felt and waterproof paper;* (8) *case strapped with steel tape ready for shipment.*

NEWS IN BRIEF.

The Submerging of Friars Island—Shoreditch and Electric Fires—Dutch Electrical Exports—The Institute of Metals—Refrigeration and the Water Board.

SHARDLOW Board of Guardians has decided to adopt electric light at the institution.

The Metropolitan Asylums Board is about to instal wireless equipment at the staff homes at Queen Mary's Hospital for Children, at a cost of £250.

After a lapse of 800 years, Mass was celebrated on July 20th on Friars Island, Killaloe, in the ruins of St. Lua's Oratory. The island is to be submerged shortly, when the area will become a reservoir under the Shannon power scheme.

Bexhill Electricity Committee recommends the purchase of 500 lamps for use in connection with strip lighting at 1s. 9d. each net.

The Metropolitan Asylums Board is to renew the electric storage battery and booster on board the training ship "Exmouth," at a cost of £635.

The Calgary (Alberta) Power Co. has placed a contract for the construction of a 66 000 V. transmission line, costing approximately $3 000 000 and running from the Ghost River power system across country to Innisfail.

Shoreditch (London) Town Hall Committee recommends the installation of electric fires at the town hall, in place of the existing coal fires. The Borough Electrical Engineer estimates the cost of the installation at £390.

The first 3 800 H.P. unit of the Shuswap Falls (British Columbia) hydro-electric power development was brought into operation recently, and power is now being transmitted for domestic and industrial purposes in the Okanagan Valley. The new works represent an investment of approximately £1 000 000.

Cheltenham Electricity Committee is recommended by the Borough Electrical Engineer to purchase a number of second-hand 100 cycle motors for hire to consumers pending the change of system. The Committee has adopted the recommendation.

The Anglo-Italian telephone service, hitherto restricted to Milan, Genoa and Turin, is now extended in Italy to Rome, Venice and Bologna. Communication with the latter places will be restricted initially to subscribers in the London telephone area, but will be made available to the provinces as soon as circumstances permit.

The "Algemeen Handelsblad" states that the total export from Holland of wireless articles during 1928 has already been exceeded by about 9 million florins during the first five months of 1929. The export of electric globes also shows an increase on the first five months of 1928, the figures for the first five months of 1928 being 10·14 million florins and for the first five months of 1929 12·83 million florins.

A meeting of the Edinburgh Telegraph and Telephone Branch of the Union of Post Office Workers, on July 19th, recorded its protest against the Post Office proposals to employ female telephonists until 11 p.m., and affirmed its opinion that if the Post Office is really concerned with social conditions, it should meet its obligations by abolishing part-time employment and providing full-time work for men at fair rates of pay.

Orders have been placed for 150 ticket issuing machines of a new type for London Underground Railway stations. Coins, consisting of pennies and/or halfpennies, to make up the sums of 3d., 4d. or 5d., are dropped into a hopper—not edgewise through a slot—and the tickets are issued automatically. The first of the new machines has been placed in service at St. James's Park station.

Callender's No. 1 Band gave a performance at Cannon Hill Park, Edgbaston, Birmingham, last week.

The Earl of Birkenhead will be present at the International Advertising Convention at Berlin next month, and will speak at a banquet there on August 12th. The British delegation will consist of 236 members of the Advertising Association (Incorporated), including the president, Lord Riddell, Sir Ernest Benn, Sir William Crawford, and Mr. William Harrison.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated July 26th, 1879:*

An electrical treatment was devised for writers' cramp.

A telephone was placed in the Congregational Church at Mansfield, Ohio, and wires were led to the houses of several aged and invalid persons, who heard the service perfectly.

* * *

Twenty-five years ago THE ELECTRICIAN *dated July 29th, 1904, reported that:*

The National Telephone Co. had 9 700 potential subscribers awaiting connection.

A demonstration of the Raworth regenerative system of tramcar control was given at Gravesend, a "one-man" car being used.

* * *

Fifteen years ago, it was stated in THE ELECTRICIAN *for July 24th, 1914, that:*

Mr. Wordingham was advocating the establishment of a National Electrical Proving House.

Tenders were about to be invited for the construction of the tunnel for the Post Office underground electric railway.

The will of the late Sir Joseph Wilson Swan, inventor of the incandescent electric lamp was proved, with net personalty of £58 344.

The West Riding County Council has voted an estimate of £356 for electric lighting at the new County Offices, Wakefield.

The Metropolitan Asylums Board is to modernise the electric lighting at the Eastern Hospital, at a cost of £157, and to put in an electrical installation at the Lambeth and Woolwich casual wards, at a cost of £375.

At a meeting last week, Wolverhampton T.C. considered a proposal that the salary of the new Borough Electrical Engineer to be appointed at Wolverhampton should be £1 000. An amendment that the salary be £850, rising to a maximum of £1 050, was carried.

The fifth International Exhibition of Inventions, in the Central Hall, Westminster, London, will be opened on October 2nd this year. As in previous years the exhibition will be divided into a trade section and a new inventions section, and gold, silver and bronze medals will be awarded. The organising and general secretary is Capt. G. Drury Coleman, 39, Victoria Street, Westminster, S.W.1.

The Institute of Metals will hold a Metallurgical Congress at Düsseldorf from September 9th to 12th, on the invitation of the Verein Deutscher Ingenieure and the Deutsche Gesellschaft für Metallkunde. Fourteen technical papers will be presented for discussion, and visits will be paid to works in Düsseldorf and neighbourhood and to the Düsseldorf Foundry Exhibition. There will also be a whole-day excursion to the works of Messrs. Krupp at Essen. Full details can be obtained from the secretary, Mr. G. Shaw Scott, 36, Victoria Street, London, S.W.1.

The programme of the City and Guilds of London Institute Department of Technology has just been issued by Mr. John Murray, Albemarle Street, London, W. (price 3s. 6d.; by post 4s.). It contains general regulations, syllabuses for examinations in technological subjects and for teachers, particulars relating to scholarships, exhibitions, prizes, fees, text books, etc. The syllabuses for examinations in telegraphy have been revised and those for electrical installation work redrafted, and the new title for the electrical engineering section is "Electrical Engineering Practice." The book consists of about 500 pages.

The Assessment Committee of the Metropolitan Water Board reports that it has obtained powers which provide that where the owner or occupier of domestic premises desires to use water in connection with refrigerating apparatus, the Board shall be entitled to require that water so used shall be paid for by measure or at such rates as may be agreed. The Committee has submitted a sliding scale of charges for unmetered supplies, but states that, as regards the type generally adopted for domestic premises, the switch simultaneously operates the water supply and the electric or gas supply, and forms a safeguard against the wasteful use of water.

LEGAL INTELLIGENCE.

Unsuccessful Appeal in Trade Name Injunction Case.

IN the Court of Appeal consisting of the Master of the Rolls and Lords Justices Lawrence and Slesser on July 22nd, the Edison Storage Batteries, Ltd., appealed from a judgment of Mr. Justice Clauson in the Chancery Division granting an interlocutory injunction restraining the company from carrying on business under their present name or any name calculated to lead to confusion between that company and the plaintiffs in the action, Edison Accumulators, Ltd.

The appellants, the defendants in the action, are an English company which had been promoted by an American company of the same name. In 1913 an agreement was entered into between the American Company and the Edison Accumulators, Ltd., plaintiffs' predecessors in title when the American company had a number of patents in this country for protecting the manufacture of their accumulators. Those patents had since expired and plaintiffs alleged that the effect of that agreement was to give their predecessors sole selling rights of Edison accumulators except the sales to Governments. That agreement continued in force until March, 1925, when it was substituted by another agreement for a period of five years with a provision for 90 days notice to terminate in the event of any breach. In January, 1929, the original Edison Accumulators company split themselves into two companies, Britannia Batteries, Ltd., and Edison Accumulators, Ltd., the latter company to have the benefit of the agreement of March 19th last, the plaintiff company received from the solicitors to the American company notice purporting to terminate the agreement on the ground that there had been breaches. On April 8th, 1929, the defendant company was registered as a private company to carry on the business of, amongst other things, selling accumulators in this country. The plaintiffs denied that there had been any breaches, and contended that in the circumstances the defendant could not carry on business under a name which so closely resembled theirs, and that there was bound to be confusion. The defendants denied that there would be confusion. They contended that their name was descriptive of goods which were sold, and the mere use of an honest description of goods could not be stopped.

Mr. Justice Clauson, as before stated, granted the interlocutory injunction as asked, stating that he was satisfied that it would be impossible for the defendants to trade under their present name without causing confusion.

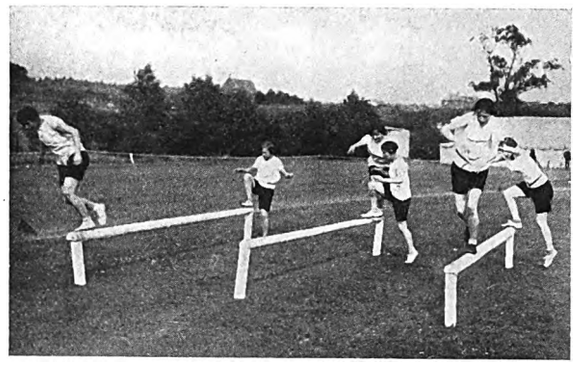
Sir Duncan Kerly, K.C., having stated the nature of the appeal, said Mr. Justice Clauson took the view that he had nothing to consider on the application except the fact that the plaintiff company had secured registration as a company of its name, and whether in his view there was likely to be any confusion between the business carried on by the plaintiffs under their name and the business of the defendants carried on under their name. The judge had refused to consider the following matters, which he (counsel) considered necessary. He had not considered whether the plaintiffs had any right to the exclusive use of their name. He had refused to consider how or why they had acquired that name. He had refused to consider whether the defendants name was descriptive of the goods which they sold, and which they were, as counsel contended, entitled to use. The judge said these matters did not concern him, and he refused also to consider whether the adoption of the plaintiffs' name was part of a scheme which counsel submitted was unquestionably a deliberate breach of contract. He contended that the court on such an application had to consider all these matters for the purpose of deciding whether the plaintiffs had a case and were likely to succeed at the trial of the action. The defendants took the view that the plaintiffs had not any right to trade under its signatory name. In any event it was not a case for granting an interlocutory injunction.

In giving judgment the Master of the Rolls said that no doubt the injunction which had been granted was of considerable importance to the appellants. But the fact was that Mr. Justice Clauson, who had the whole matter before him, had decided that it was not right to leave the question to be decided *in medio* at the present stage, and he (the Master of the Rolls) did not see his way to overrule the decision of the learned judge.

The Lords Justices concurred, and the appeal was accordingly dismissed with costs.

THE SOCIAL SIDE.

THE second and third of the annual series of golf competitions held at Preston by the staff of Siemens Lamp Works have recently been decided. These competitions are exceptionally popular and are most keenly contested. In the "S. H. Callow" golf competition (18 holes medal play) the successful competitors were :—1, A. G. Ogles; 2, S. Facer, jun., and 3, J. Lawrence. For the "W. O. Smith" prize, a "Graveyard" competition was chosen, being won by A. Facer, with W. Higginson and K. G. Lochhead second and third respectively. In the singles Bowling Tournament, A. Dilworth beat J. Foort in the final, the defeated semi-finalists being T. Wood and W. Marsh. All the competitions were held at Ashton Park, Preston, the sports ground of the Dick Kerr Club.



THE start of the ladies' obstacle race at the recent G.E.C. annual Witton Sports Gathering. The attendance was in the neighbourhood of 5 000, and various challenge cups were offered to competitors from all works and branches of the G.E.C. throughout the country. There were 427 competitors.

Messrs. James Bros., electrical engineers, Trowbridge, recently entertained their staff on an outing to Weston-super-Mare. The party numbered 60, and included the employees at the branches at Chippenham, Marlborough, and Devizes.

The employees of Messrs. Ernest F. May, Ltd., of Camden Town, London, had their annual outing recently. A party of 80 travelled to Clacton-on-Sea by rail, and dined at the Royal Hotel, Clacton, the chair being occupied by Mr. Chas. G. Fox. The function was voted a great success.

The annual sports of J. G. Statter and Co. were held on June 15th, a large company being present. Chief honours fell to H. Blake, who, with a series of firsts, easily carried off the Addenbrook Cup presented for the best individual aggregate of points. Among those present we noted Mr. J. G. Statter (just returned from South Africa), Mr. and Mrs. Addenbrook, Mrs. Albright and Mr. Wm. Albright. Mrs. Marston presented the prizes, and the sports were held in the grounds of Major Marston.

The annual outing of the Revo Electric Co., Ltd. (comprising Revo Electric Main Works, Revo Electric Heating and Cooking Department, Revo Foundry Co., Tividale Enamel Co., and the Groveland Brass Foundry Co., the employees numbering about 1 400), took place on July 6th, the destination being New Brighton. Two special trains were chartered from the L.M.S. Railway, and the party started from Dudley Port at 7 a.m., arriving at Liverpool about 9.30. The arrangements for the day were laid out by the Revo Social Sports Club, and after a pleasurable time seeing the sights of New Brighton quite a number took the ferry back to Prince's Landing Stage to visit the "Cedric," the "Duchess of York" and the "Samaria." The party then toured Liverpool, and even got as far as Southport, but eventually all turned up in time to catch the train at Lime Street Station for the return journey.

On June 15th the Mullard Companies held their annual outing, which this year was to Margate by special train, leaving Victoria at 8.30 a.m. An excellent luncheon was provided by the directors of the companies at the Queen's Highcliffe Hotel. The second annual sports meeting was held at the Sports Ground on the following Thursday, June 20th, when many valuable prizes were presented to the winners by Mrs. S. R. Mullard.

PERSONAL.

SIR Hugo and Lady Hirst left London for Aix-les-Bains on July 20th.

Admiral H. W. Grant has joined the board of the Globe Telegraph and Trust Co., Ltd.

Mr. J. A. Benn and his Bride leaving St. Margaret's on Tuesday.

The marriage of Mr. John Andrews Benn and Miss Ursula Hankey was solemnised by the Bishop of Southwark, at St. Margarets, Westminster on Tuesday. Mr. Benn is the eldest son of Sir Ernest Benn, chairman of Benn Brothers, Ltd., the proprietors of THE ELECTRICIAN, and is himself a director.

Among overseas callers at THE ELECTRICIAN offices this week was Mr. Herbert W. Young, president of the Delta Star Electric Co., of Chicago.

The Duke of Atholl, Sir Philip Cunliffe-Lister, M.P., and Mr. Follett Holt have been elected additional directors of the Anglo-Argentine Tramways Co., Ltd.

Mr. Percy Rosling, general manager of W. T. Henley's Telegraph Works Co., has been nominated to fill a vacancy on the Beckenham Urban District Council.

Mr. E. T. Price, electrical engineer to Messrs. Wm. James and Sons, Cardigan, has been appointed electrical engineer to the Newcastle Emlyn and District Electric Supply Co.

Mr. H. C. Godsmark, chief technical assistant in the rolling stock branch of the Manchester tramways undertaking, has been appointed rolling stock superintendent of the Nottingham tramways.

Estate of the gross value of £476 992, with net personalty £367 296, was left by the late Mr. Bernard A. Firth, chairman of Thos. Firth and Son, Ltd., and a director of the English Electric Co., Ltd.

Glasgow Electricity Committee has recommended the appointment of Mr. Thomas I. Craig, now mains district superintendent, as sales manager, at a commencing salary of £600 per annum, rising to £850.

Mr. T. J. Francis, who has been a lecturer at Bolton Technical College and Manchester High School of Commerce six years, has been appointed lecturer in mechanical and electrical engineering at Plymouth and Devonport Technical College.

Derby Tramways Committee has recommended until November the continuation of the appointment of Mr. P. W. Bancraft as acting tramways manager, a position he has held since the retirement of Mr. F. Hardy at the end of last year.

Mr. A. Nichols Moore, borough electrical engineer for Newport, has been placed on the short list of applicants for a similar position at West Ham, shortly to become vacant by the appointment of Mr. F. W. Purse to the London Joint Authority.

Mr. Hubert Pryce Jones has been appointed assistant technical engineer at the Liverpool electricity undertaking. He first joined the department as a temporary assistant in connection with the preliminary work on the Clarence Dock power station.

Messrs. P. H. Peake and G. A. Roberts have been appointed sub-station attendants at Brighton Corporation's Southwick power station. Mr. Anderson, one of the present sub-station attendants, has obtained another appointment, and is succeeded by Mr. L. Brown.

IN PARLIAMENT.

Rejection of the Bills for the Co-ordination of London Passenger Traffic.

IN the House of Commons on July 17th, Sir Kingsley Wood in moving the third reading of the London County Council's (Co-ordination of Passenger Traffic) Bill, said in 20 years pressure on the local railways had doubled, tramway passengers had increased from 361 millions to nearly 1 000 millions and omnibus passengers from 280 millions to 1 671 millions per annum. The present conditions were chaotic and dangerous. The proposals in the Bill followed the recommendations of the London Traffic Advisory Committee.

Mr. Percy Harris, who moved the rejection of the Bill said it was unsound to concentrate the traffic into the hands of Lord Ashfield, the head of the tube and omnibus combine.

The Minister of Transport (Mr. H. Morrison) said the matter was receiving the immediate attention of the Government but these Bills would not to any material extent solve the problem.

Col. Ashley (ex-Minister of Transport) said it was a crying scandal that London should have to wait many years for improved traffic.

The Bill was rejected by 295 votes to 172, and the London Electric Railways (Co-ordination of Passenger Traffic) Bill was rejected without a division.

Relief of Unemployment.

In the course of the discussion in the House of Commons last week on a resolution to guarantee, at any time within three years from August 31st next, the payment of principal and interest on loans for capital expenditure on schemes for development, reconstruction or re-equipment in connection with public utility undertakings, up to £25 000 000, Mr. J. H. Thomas (Lord Privy Seal) said the Government did not intend to ignore the wider aspect of the question. The whole problem of electrification was the next stage, and he would include the question of export credits, but it was no use coming to the House with a partial scheme. He wanted sufficient transport and cheap power, and he would take into consideration not only the unskilled, but the skilled men out of work. Municipalities were tied by the percentage of 15% unemployment before they could be given certain grants. He wanted to reduce it to 10%. The resolution was passed.

Replies to Questions.

The following are points from recent answers to questions in the House of Commons :—

The Postmaster-General is pressing forward with the provision of telephone call offices in rural districts. A survey is being made of all rural post offices and stations now without telephone facilities.

The Minister of Agriculture states that the provision of electric power apparatus for buildings (including farm buildings, etc.), is included among the purposes for which loans may be sanctioned under the Improvement of Land Acts.

Telegrams exchanged during the first quarter of this year by Post Office beam stations were 506 000, against 451 000 in the corresponding quarter last year, and by the Imperial cables 123 000 in the past quarter, against 115 000 in the corresponding period last year.

The Minister of Transport (Mr. Herbert Morrison) states that an electricity scheme for South-West England and South Wales, including Carmarthenshire, is at present being prepared by the Electricity Commissioners, and will be ready for transmission to the Central Electricity Board before the end of the present year.

The railway companies have been asked to suggest comprehensive schemes of development and improvement, including an extension of electrification. The Minister of Transport will bring to the notice of the railway companies concerned a suggestion by Mr. J. C. Ede with regard to electrification of the railway between Newcastle-on-Tyne and South Shields.

The Postmaster-General (Mr. H. B. Lees-Smith) says the automatic system of telephony, involving dialling by subscribers, has long been in use in a number of provincial areas with satisfactory results. In London the system, on the whole, is giving efficient service. The conditions of working are necessarily much more complicated than in the smaller provincial areas, and he has received a certain number of complaints into which he is instituting a special inquiry.

THE E.P.E.A.

London Technical Group Pays Interesting Visit to Electrical Works.

THE London Technical Group of the E.P.E.A. paid a visit to the works of the Hackbridge Electric Construction Co., Ltd., and the Hewittic Electric Co., Ltd., at Hersham, Walton-on-Thames, on July 6th.

The parties first entered the glass shop, where various glass blowing operations were being carried out in the manufacture of the rectifier bulbs and quartz tube burners. From there the parties passed into the main erecting rectifier bay, where they inspected the following equipments:—One 96 kW three wire set (two bulbs) to feed a 240/0/240 V three wire network from a 6 600 V three-phase 50 cycle supply, for Maidenhead Corporation; one 500 kW (four bulbs) set for Llanvanor Road sub-station of the North Metropolitan Electric Power Co., to feed a 550 V two wire traction system from a 11 000 V three-phase 50 cycle supply, and one 500 kW two-wire (four bulbs) set for the Kensal Green sub-station, to feed a 550 V two wire traction system from a 3 300 V three-phase 50 cycle supply; one 135 kW (two bulbs), three wire set to deliver 260/0/260 A at 260/260 V d.c. from 6 600 V three-phase 50 cycle supply, for Delhi; a 1 500 kW sub-station equipment (12 bulbs), and a 750 kW sub-station equipment (six bulbs) for West Ham Electricity Department, both to feed into a 550 V, two-wire traction system from a 6 200 V two-phase 50 cycle supply; a 450 kW two wire (four bulbs) set to feed the outers of a 460/230 V three wire light and power network, and to feed into 550 V traction system, for Bournemouth and Poole Electricity Supply Co., and a 120 kW three wire set (two bulbs) to feed into the inners of a 460/230 V three wire system for balancing, for the same company; both these equipments to operate off an 11 000 V three-phase 100 cycle supply. Other equipment inspected consisted of a 75 kW equipment (one bulb) to deliver 520 V d.c. two wire from a 415 V three-phase 50 cycle supply, to feed crane motors at Timaru Harbour, New Zealand, while apparatus for the Finchley U.D.C. consisted of (*a*) for Hamilton Road sub-station, two 200 kW equipments (four bulbs); (*b*) for Percy Road sub-station, one 300 kW equipment (four bulbs); (*c*) for Hill Rise sub-station, one 220 kW equipment (two bulbs); (*d*) for Holly Bank sub-station, two 150 kW equipments (four bulbs). All to feed into the outers of a three-wire d.c. light and power network 500 V from a 6 600 V three-phase 50 cycle supply. A 75 kW equipment (one bulb) to deliver 550 V d.c. two wire from 6 600 V three-phase 50 cycle supply—for a power load for the Public Works Department, Sydney, N.S.W., was seen, while a 2 000 kW rectifier equipment (16 bulbs) to feed into a light and power network 480 V d.c. from a 6 600 V three-phase 50 cycle supply, for Shoreditch, was also examined. Various lift rectifier equipments, of 2, 4, 5, 10 and 15 H.P. capacity, for Messrs. Waygood Otis, Express Lift, Hammond Bros. and Champness, J. and E. Hall, etc., also some equipments for charging batteries for the Commodore Theatre and some for feeding projection arcs for the Dominion Theatre, and sundry other sets, were also seen. Various models of ultra violet ray lamps, service light lamps for industrial illumination, and photographic lighting equipments both for still studios and cinema studios, and for printing and enlarging copy, were other interesting items.

After leaving the rectifier bay, the party proceeded to the core steel cutting and core erecting shop where a number of large cores were in process of construction. The main erecting bay was then visited, and here was on view a 10 000 kVA transformer for the North Western Scheme of the Central Electricity Board for installation at Stockport, stepping up from the Stockport generating station to the overhead line which is running to Marples, Buxton and Macclesfield. This transformer is to be provided with a special type of voltage regulator for on-load voltage control.

There were also a very large number of other transformers in various stages of construction, including some large 2/12-phase units for West Ham for operation in conjunction with a bank of Hewittic rectifiers, and three 4 000 kVA three-phase 25 cycle units for Birmingham Corporation, the company having received an order for 21 of these transformers. Those at present in the shop are the last to go through. There were also some 2 500 kVA units for the Central Electricity Board and a 3 000 kVA 33 kV transformer for Messrs. Merz and McLellan, also the completed windings of some of the 45 000 kVA three-phase transformers which are being built for the Central Electricity Board's S.E. England scheme. See page 123.

FACTORY LIGHTING.

Report on the E.D.A.-E.L.M.A. Factory and Workshop Lighting Campaign.

THE inadequate lighting conditions of the workshops and factories in Great Britain had been known for some years, and in order to obtain more definite information an intensive survey was carried out under the auspices of the E.L.M.A. Lighting Service Bureau during 1927, which indicated that some 70% of the workshops and factories were badly and incorrectly lighted. It was therefore arranged to conduct an educational Factory Lighting Campaign during the autumn of 1928, the campaign being planned by the E.L.M.A. Lighting Service Bureau and conducted by the Electrical Development Association, and a full report of the campaign has just been published.

In all 96 towns co-operated in the campaign, during which 72 addresses were delivered to the electrical trade and 120 lecture-demonstrations were given to industrialists. The total attendances at these meetings were 5 931, the attendances at individual meetings ranging from 30 to 150 persons.

The majority of the lectures were given by members of the E.L.M.A. Lighting Service Bureau, and, although it was not found possible in the majority of instances to secure a factory or part of a factory for lecture demonstration purposes, other methods were adopted with very satisfactory results. In one area 95% of the lectures were given in public halls, model factories, technical colleges, and showrooms, all of which were arranged for demonstrating old and modern systems of lighting. The cost of providing these demonstrations varied from £5 to £50, according to the size of the room or the building available, excluding this cost of lighting equipment or buildings which were loaned to the Electric Circles by the manufacturers and supply authorities respectively. In another area, advantage was taken of an engineering exhibition to organise a factory lighting exhibit and an information bureau. In another part of the country one of the largest manufacturing firms placed their workshops at the disposal of the Area Committee for lecture-demonstration purposes and some 350 industrial consumers attended one of the lectures.

Over 100 000 postal communications were mailed direct to factories and workshops, while 112 advertisements appeared in various trade journals during the period of the campaign. Over 2 400 inquiries were received as a result of this publicity, and followed up by propaganda material or a personal call.

The accounts of the campaign show a balance in hand at May 21st last of £1 015 15s. 9d., and this amount, less £70 for preparation, printing, circulating, etc., the report, is to be expended on a further booklet dealing with factory lighting, and will contain reproductions of photographs of good industrial lighting in modern factories.

RURAL ELECTRICITY.

Further Meeting of Conference on Electricity Supply in Rural Areas.

ON July 16th, a further meeting of the Conference on Electricity Supply in Rural Areas (convened by the Electricity Commissioners) was attended by 22 representatives of Government Departments and of various associations and other bodies interested in the subject. The main purpose of the meeting was to consider the action which had been taken on the various recommendations embodied in the report of their proceedings published by the Commissioners in July, 1928. A summary of the action taken on the matters dealt with since June, 1928, was considered, with documents relating to various aspects of electricity supply in rural areas which had been furnished by or through the medium of the Ministry of Agriculture, the Department of Agriculture for Scotland, etc. It was noted that various important schemes for the development of supply in different parts of the country under Electricity Acts and Orders had been or were about to be approved by the Electricity Commissioners; that the Commissioners, with the concurrence of the Minister of Transport, had appointed a technical officer whose duties would be specially concerned with the fostering of rural electrification, and that the Commissioners had appointed committees which were at present investigating the questions of uniformity of electricity charges and tariffs, and the provision of facilities for assisted wiring and the hire and/or hire purchase of electrical apparatus.

A further meeting of the conference is to be convened as soon as the reports of the committees have been received.

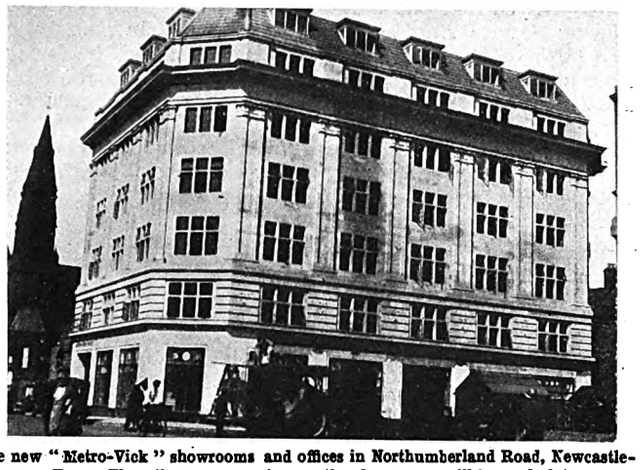
BUSINESS ITEMS.

YOUNG, OSMOND AND YOUNG, LTD., announce that the Bexley Heath Works have been closed and new premises opened at Welwyn Garden City, Herts.

The ELECTRIC HEATING Co., George Street, Croydon, announces that Mr. N. Weatherston, jun., of Union Chambers,



The new "Metro-Vick" showrooms and offices in Northumberland Road, Newcastle-on-Tyne. The offices are now in use, the showrooms will be ready later.

32, Granger Street West, Newcastle-on-Tyne, has been appointed to act as agent in the Tyne and Tees district

At the Royal Agricultural Show at Harrogate, DAVEY, PAXMAN AND CO., LTD., engineers and boilermakers, of Colchester, and Aldwych House, Aldwych, London, W.C.2, are exhibiting a 120/138 B.H.P. 3 cylinder vertical heavy fuel oil engine, which will be representative of this firm's wide range of oil power plants.

The HACKBRIDGE ELECTRIC CONSTRUCTION CO., LTD., announces that the works and offices at Molesley Road, Hersham, Walton-on-Thames, will be closed for the annual holidays from 12 noon, August 3rd, until 9 o'clock on Monday morning, August 12th. An emergency staff will be in attendance to deal with correspondence requiring urgent attention.

A big explosion of a cylinder of carbonic acid gas took place at the back of the Cardiff offices of TUNGSRAM ELECTRIC LAMP WORKS (GREAT BRITAIN,) LTD. Considerable damage was done to the doors and windows leading into the store room. The lamps which were stored in the affected premises proved, however, on test, to be none the worse for the explosion.

The engineers' holidays arranged between the Huddersfield Engineering Employers' Association and the various trades unions concerned this year extended from Friday, July 19th, until Monday, July 29th. The directors of Hopkinsons, Ltd., Britannia Works, Huddersfield, have decided to pay a full week's wages to all employees who are not in receipt of standing wages and who have been in the employment of the company for more than 12 months, so that they will not be losers by the week's stoppage.

Amongst several orders recently received by the HART ACCUMULATOR CO., LTD., Marshgate Lane, Stratford, London, E.15, for "Hart" batteries for telephone exchanges, may be mentioned Dewsbury—2 batteries each consisting of 11 "STC. 13" type cells having a capacity of 588 Ah; Grimsby—1 battery consisting of 30 "STD. 17" cells having a capacity of 1 322 Ah; Stanmore—2 batteries of 11 "STC. 5" cells each (in 19 plate boxes), of 195 Ah; Santiago—2 batteries of 30 "D. 51" cells, of 3 525 Ah; Malta—2 batteries of 25 "STB. 7" cells, of 150 Ah; Edinburgh, Granton—2 batteries of 30 "STC. 9" cells (in 15 plate boxes) having a capacity of 391 Ah. There are already three telephone exchanges in Edinburgh in which "Hart" batteries are installed, and the two additional equipments mentioned will make a total of five exchanges in Edinburgh in which batteries they manufacture are fitted.

A contract has just been placed with the GENERAL ELECTRIC CO., LTD., of Magnet House, Kingsway, London, W.C.2, for electrical equipment for the rolling stock required in connection with the Manchester-Altrincham electrification scheme. The contract covers 100 heavy railway motors each rated at 328 B.H.P. on the one-hour rating, together with electro-pneumatic contactor type control equipments for 24 motor coaches, 22 driving trailer coaches, and 22 trailer coaches. Air operated pantagraphs for current collection from an overhead wire and also motor-generator sets for supplying low tension current for the control and lighting circuits are also included. The order also covers the complete heating and lighting equipment for the 68 coaches, and it is interesting to note that the heating will be carried out at the line voltage of 1 500. The contract amounts to a total value of over £100 000.

The ELECTRIC FURNACE CO., LTD., of 17, Victoria Street, London, S.W.1, has recently concluded an agreement with Hirsch, Kupfer und Messingwerke A.G., Eberswalde, Germany, in accordance with which they have the right to the British and French patents, and the use of drawings and information relating to the various types of electric resistance furnace developed by the latter company. Messrs. Hirsch have, we are informed, applied electricity to metal melting, annealing and reheating to a greater extent than any other non-ferrous metal manufacturers. Their furnace equipment includes continuous strip annealing plant, side-charged tube annealing furnaces, bright annealing furnaces, and furnaces for reheating ingots, in addition to a large battery of Ajax-Wyatt and Ajax-Northrup furnaces. The total consumption of electricity for furnaces at these works is about 18 000 000 kWh per annum.

The London Power Co., Ltd., has notified FERRANTI, LTD., that their tender for three 80 000 kVA 11/66 kV three-phase transformers has been accepted. These units are for direct connection to 67 250 kW turbo-alternators to be installed at the new Battersea power station, one alternator and its associated transformer forming a single unit, switching being carried out on the 66 kV side. This order for such large three-phase units, following similar orders placed by the Central Electricity Board, shows that the gain in economy resulting from the use of one three-phase unit in place of three single-phase is fully appreciated—at least by the larger undertakings. Included in the order for the 80 000 kVA units are: four 20 000 kVA 66 kV/22 kV and two 4 000 kVA 66 kV/3·3 kV. It is interesting to note here that Ferranti, Ltd., have in course of construction two 60 000 kVA 132/66 kV transformers for the "grid" connection to Battersea. The total kVA of Ferranti transformers to be installed at Battersea will therefore approach half a million.

DORKING SPECIAL ORDER INQUIRY.

Opposition by the London and Home Counties Joint Electricity Authority.

SIR William Marwood, on behalf of the Ministry of Transport, held an inquiry at Dorking on July 19th into an Electricity Special Order which embodies an agreement between Dorking U.D.C. and Edmundson's Electricity Corporation, Ltd., for leasing the Dorking electricity undertaking to the latter for a further 40 years. The Order has been approved by the Electricity Commissioners, is now before the Minister of Transport for confirmation, and its confirmation was opposed by the London and Home Counties Joint Electricity Authority and by residents in the area.

Mr. W. Craig Henderson, K.C., for Edmundson's, said the new agreement provided that the Dorking Electricity Supply Co. should be formed, that Edmundson's should repay to the council all the outstanding loans, that the maximum prices should be 10d. per kWh for lighting and 3d. for power (with a sliding scale for price) and a dividend on the basis of 8%. If the Joint Electricity Authority's intervention meant anything, it meant, "You advise the Minister to withhold his consent to the Order because we (the Joint Authority) might in the future possibly be enabled to do something."

Mr. R. Sanders, opposing the Order on behalf of the villages of Buckland and Betchworth, said they knew Edmundson's had sold the whole of the ordinary capital to the Greater London Trust, Ltd., which was registered in England as an English company, but was controlled by American citizens.

Sir Lynden Macassey, K.C., for the Joint Electricity Authority, said his authority had no object save to secure in their district the cheapest and most efficient supply of electricity which could be secured. A condition of things had been created by quite bona fide action on the part of the Dorking Council and the company which had prevented consideration of the Joint Electricity Authority's powers and obligations in regard to the supply of electricity.

Expert evidence was given, and it was stated that the Joint Electricity Authority had made arrangements for bulk supply between Kingston and Walton-on-Thames, and within twelve months the mains could be extended to Dorking.

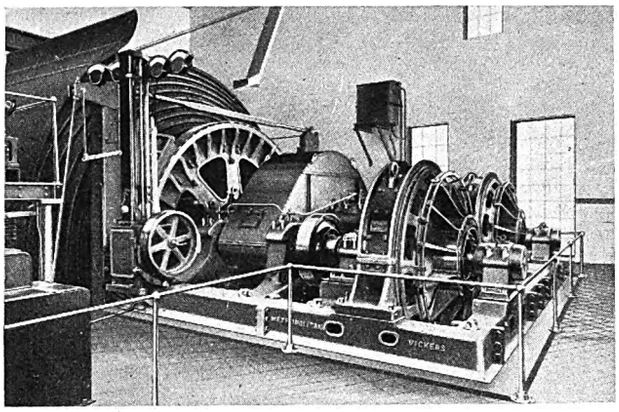
ELECTRIC WINDERS.

Recent Contracts for Large Equipments with Important New Features.

FIVE large electric winder sets are included among recent orders for winding equipment placed with the METROPOLITAN-VICKERS ELECTRICAL CO., LTD. All five sets are to be arranged with Ward-Leonard control, three with direct coupled motors and two with geared motors. The sets represent an interesting variety of applications, two being for a deep gold mine on the Rand, two for a new copper mine in Northern Rhodesia, and one for service involving exceptionally heavy output at a colliery in New South Wales.



An example of winding equipment manufactured by the Metropolitan-Vickers Electrical Co., Ltd.

New features of special interest are included in two of the equipments, those for Rhodesia, one development being a hydraulic slip regulator between the motor and the flywheel of the motor generator set and the other an improved system of automatic braking control.

The two winders for the Rand are equipments of 2 150 r.m.s. and 4 310 H.P. working peak capacity ordered by the Union Corporation, Ltd., for East Feduld Mines, Ltd. The electric winders are to replace two steam engine equipments, one carrying men and the other hoisting ore, in an installation 5 600 feet above sea level. The depth of the shaft is 3 350 feet and the net load to be handled in the case of the ore hoist is 7 short tons (14 000 lb.), the output required being 230 tons per hour. The two equipments will be similar, the winder motor in each case having a normal speed of 58 r.p.m. and being coupled to two cylindrical drums 14 feet in diameter and 5 feet between flanges. The normal maximum winding speed will thus be 2 580 f.p.m. The two motor generator sets will each consist of an 1 800 H.P. 2 000 V induction motor direct coupled to a 1 550 kW 640 V D.C. generator. The sets will not be equipped with flywheels as the power will be taken from the Victoria Falls and Transvaal Power Co. It is intended ultimately to increase the working peak capacity of the equipments to 4 570 H.P. by taking out part of the permanent resistance in the generator field circuit, thereby increasing the winding speed by about 5% and the output capacity to 245 tons per hour. The Metropolitan-Vickers Company is the main contractor for the installation including the cable work; the sub-contract for the mechanical parts has been placed with BLANE AND CO., LTD., of Johannesburg, who will supply parts manufactured by FULLERTON, HODGART AND BARCLAY, LTD.

Caledonian Collieries, Ltd., of New South Wales, have ordered, through their managing agents, HOWARD SMITH, LTD., of London and Sydney, an electric winder of 1 900/4 000 H.P. to replace a steam engine equipment at a shaft of Aberdare Colliery, where it is required to increase the output to 557 tons per hour. The new equipment is to do this by a schedule of 133 trips per hour with a net load of 4¼ tons. The time for the trip of 530 feet is thus only 27 seconds, of which 7 seconds is allowed for decking. The acceleration is 5·53 feet per second and the maximum winding speed 2 555 feet per minute. The motor is designed for operation at 70·5 r.p.m. and will be direct coupled to a cylindrical drum 12 feet in diameter and 6½ feet wide. The motor generator set will consist of a 680 H.P. induction motor coupled, with a flywheel, to a 1 170 kW d.c. generator, this equipment being housed in a separate building about 50 yards from the winder house. The Metropolitan-Vickers Company is the main contractor for the installation, including cable work. The sub-contract for the mechanical parts has been placed with VICKERS-ARMSTRONGS, LTD. It is interesting to note that at another shaft of the Aberdare Colliery there is installed another Metrovick equipment, rated at 4 500/11 250 H.P. This winder raises a net load of 7½ tons from a depth of 1 260 feet and maintains an output of 490 tons per hour.

The Roan Antelope Copper Mines, Ltd., which is operating in the opening up of a large new field of copper mining concessions in Northern Rhodesia, has ordered two geared d.c. winders of 1 290/2 580 H.P. with Ward-Leonard control for a new shaft 1 100 feet deep. In this installation also the two winders, one for men and one for ore, will be similar. The loads to be dealt with are 12 short tons and 10 short tons respectively, and the output of ore will be 500 tons per hour. The winding drums will be cylindrical of 16½ feet diameter for the man hoist and 14½ feet diameter for the ore hoist, with gear ratios to give the same winding speed, 1 400 feet per minute, in each case. Power will be supplied from the company's own system at 3 000 V three-phase 50 cycles and converted by a motor generator set consisting of a 960 kW generator with a flywheel of 6½ tons.

TRADE PUBLICATIONS.

THE July stock list has been received from HIGGS MOTORS, Witton, Birmingham.

BLACKSTONE AND CO., LTD., Stamford, have issued a new folder describing portable power and pumping plants.

The July blotter of the JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Square, London, S.W.1, illustrates the "Junior" cooker, No. 501.

The ELECTRIC HEATING CO., George Street, Croydon, has issued a new leaflet dealing with the "Utility" frame, whereby an electric iron may be used as a hot-plate.

The "P.B." thermo-electric surface pyrometer is the subject of publication L.124, issued by the DRAYTON REGULATOR AND INSTRUMENT CO., LTD., of West Drayton, Middlesex.

BRITISH INSULATED CABLES LTD., Prescot, have published a new bridge marker, P.248, dealing with butt welders, and a July telephone circular. Publication P.248 replaces P.231.

Among the latest publications of RADIO INSTRUMENTS, LTD., 12, Hyde Street, London, W.C.1, is a special leaflet describing the "Dual Astatic" high frequency choke for use in radio circuits.

Some useful wiring hints with the "Callender Kalibond" wiring system are given in a special publication of CALLENDER'S CABLE AND CONSTRUCTION CO., LTD., Hamilton House, Victoria Embankment, London, E.C.4. The publication takes the form of a covered folder of linen bearing printed illustrations of the system, with suitable descriptions.

CROSSLEY BROTHERS, LTD., Manchester, have sent us publication 1 048a, entitled "Crossley Products." A copy of the new refuse fuel gas plant catalogue No. 1 275, together with souvenir booklet, publication No. 1 286, have also been received. The latter deals with the visit of the Institution of Mechanical Engineers on the occasion of the summer meeting and visit to Manchester.

EVERSHED AND VIGNOLES, LTD., Acton Lane Works, Chiswick, London, W.4, have published a new "Megger" earth tester catalogue. This publication has been entirely re-written since the first edition, as knowledge of earth testing has advanced considerably during the past few years. The catalogue contains an explanation of the purpose and importance of earth testing, and notes on the general theory of the "Megger" earth tester.

The FULLER ACCUMULATOR CO. (1926), LTD., Woodland Works, Chadwell Heath, Essex, has published a complete list of car replacement batteries in the form of a sheet which may be hung on the wall. The list is tabulated under four headings, these being make of car, year of manufacture, model number, and horse-power, and the series number of the accumulator which is most suitable. This sheet should be used in conjunction with the company's No. 103, which gives full particulars of sizes and prices.

A similar list, but giving in addition information as to voltage, capacity, dimensions, height over terminals, prices uncharged, and prices for acid and first charge, has also been published relating to "Lucas," "C.A.V.," and "Rotax" batteries. This is the fourth edition, and forms an easy reference to the correct type of battery for any make of British and foreign car or commercial vehicle. This list is obtainable from C. A. VANDERVELL AND CO., LTD., Acton, London, W.3.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

HULL CORPORATION.—Tramway overhead equipment, including poles, cable, trolley wire, etc. Schedules from the General Manager, Tramway Offices, Albion Street, Hull.

ABERTILLERY URBAN DISTRICT COUNCIL, July 26th.—Static transformer and low pressure switchgear for new central sub-station at Carlyle Street, Abertillery. Specifications from Mr. Dawson Thomas, engineer and manager, Electricity Offices, Abertillery, Mon.

HOUSE WIRING AT TORRY, July 26th.—Electrician's work of two houses at Balnagask Road, Torry, Aberdeen, for Mrs. W. Brebner and Mr. Alex Robb, respectively. Schedules, etc., from Mr. G. M. Hay, 177, Union Street, Aberdeen.

Electrical Generator for Gasworks.

MANCHESTER CORPORATION, July 26th.—Manufacture, supply, and erection of a heavy oil engine and a c.c. generator at Partington gasworks. Specification, etc., from Mr. J. H. Sillitoe, Gas Department, Town Hall, Manchester.

CENTRAL ELECTRICITY BOARD, July 27th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Mid-East England Electricity Scheme. Specification (No. M.E.E.-P.L. 1), etc., from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, W.C.2; deposit £2 2s.

HARLOW (ESSEX) LIGHTING COMMITTEE, July 27th.—Lighting the district from September 20th, 1929, to April 30th, 1930, by electricity or by other means (57 lamps), and also one lamp at the "George," for 12 months. Further particulars from Mr. R. C. Cowlin, chairman of the Committee.

NEWCASTLE-ON-TYNE GUARDIANS, July 27th.—Supply of X-ray apparatus for Wingrove Hospital, Westgate Road, Newcastle-on-Tyne. Further information from the Medical Superintendent.

ROYSTON COUNCIL SCHOOL, July 27th.—Electric light installation. Specification, etc., from Mr. G. T. Tipps, divisional clerk, Education Offices, Cudworth, Yorks.

ASHTON-UNDER-LYNE AND DISTRICT SMALLPOX HOSPITAL BOARD, July 29th.—Electric light installation at smallpox hospital. Specifications from Mr. N. Appelbee, Corporation Electricity Department, Wellington Road, Ashton-under-Lyne.

AYRSHIRE EDUCATION COMMITTEE, July 29th.—Electric light installation in connection with extensions to the Royal Academy at Irvine. Schedules, until July 29th, from Mr. William Reid, master of works, Education Offices, Ayr.

CARDIFF RURAL DISTRICT COUNCIL, July 29th.—Supply, etc., of sub-station equipment, underground cables, overhead lines, etc., in parish of Radyr. Forms of tender, etc., from Mr. R. Howard Fletcher, 3, Park Place, Cardiff.

LANARKSHIRE COUNTY COUNCIL, July 29th.—Electric lighting work in connection with additions to Longriggend Sanatorium. Particulars from the architect, Mr. P. C. Smith, District Offices, Hamilton. Applications for schedules to be made before July 29th.

DUNDEE CORPORATION, July 30th.—Electric light installation in connection with Fleming Trust housing scheme, Particulars from Mr. G. Baxter, 91, Commercial Street. Dundee.

MANCHESTER GUARDIANS, July 30th.—Circulating pumps and electric cable, at Crumpsall Institution. Specification from Superintendent of Works, Union Offices, All Saints', Manchester.

BEXHILL CORPORATION, July 31st.—Electric light installation in the Pavilion. Specification from Borough Electrical Engineer, Ashdown Road, Bexhill.

COMMISSIONERS OF H.M. WORKS, ETC., July 31st.—Electric lighting and power wiring at Natural History Museum, South Kensington, London, S.W. Specification, etc., from Contracts Branch, King Charles Street, London, S.W.1; deposit £1 1s.

MANCHESTER GUARDIANS, July 31st.—Supply of portable X-ray apparatus to Withington Hospitals, West Didsbury. Tenders to the Clerk, Union Offices, All Saints, Manchester.

SKIPTON URBAN DISTRICT COUNCIL, July 31st.—Supply of 500 yds. of 0·15×0·15×0·15×0·075 sq. in., l.t. cable, paper insulated for 660 V, lead covered, double steel tape armoured, compounded, shaped conductors. Tenders to the Clerk, Town Hall, Skipton.

CARDIFF GUARDIANS, August 1st.—Electrical installations and main distribution cables. Further particulars from the Clerk, 11, Park Place, Cardiff, until August 1st.

ROCHFORD GUARDIANS, August 7th.—Underground cables, switchgear instruments, wiring, 25 H.P. motor, starting gear, etc. Specification, etc., from Mr. H. Tomlinson-Lee, 26, Victoria Street, Westminster, S.W.1; deposit £2 2s.

SALFORD CORPORATION, August 10th.—Low tension, paper insulated, lead covered and armoured cables. Forms of tender from the City Electrical Engineer.

LONDON COUNTY COUNCIL, August 12th.—Supply and installation of nine 1 000 kW rotary convertors, with static transformers. Specification, etc., from the General Manager, Tramways Offices, 23, Belvedere Road, London, S.E.1; deposit £1 1s.

UTTOXETER URBAN DISTRICT COUNCIL, August 12th.—Overhead 11 000 V transmission line; e.h.t. and l.t. cables and roadwork and public lighting; and sub-station equipment. Persons desiring to tender must notify Mr. W. C. C. Hawtayne, 9, Queen Street Place, London, E.C.4.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., August 13th.—Supply of ironclad unit type switchgear, at the National Physical Laboratory, Teddington. Specifications, etc., from the Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1; deposit £1 1s.

NEWCASTLE ENDOWED SCHOOLS, August 24th.—Electric light installation in a new wing to be erected at each of two schools, viz.: Newcastle-under-Lyme High School, and Newcastle-under-Lyme Orme Girls' School. Specifications, etc., from Messrs. Cramp and Frith, 1, Dickinson Street, Manchester; deposit £3 3s. in respect of one contract, or £6 6s. in respect of both contracts. Tenders are invited only from firms on the National Register of Electrical Installation Contractors.

COMMITTEE OF VISITORS OF GLOUCESTERSHIRE MENTAL HOSPITALS, August 26th.—Electric wiring of Wotton and Coney Hill Mental Hospitals, on "Stannos" earthed concentric system. Specification, etc., from Messrs. Handcock and Dykes, 11, Victoria Street, Westminster, S.W.1; deposit £2 2s.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—One 30 000 kW C.M.R. turbo-alternator and exciter, etc. Specifications from the Borough Electrical Engineer, 18-24, Lower Clapton Road, E.5, on and after July 30th; deposit £30.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—Fourteen 6 600 V, three-phase, metal clad, oil circuit breaker equipments, each not less than 1 000 000 V rupturing capacity; remote electrically-controlled, duplicate busbars; cabling and auxiliary gear controlling one 30 000 kW turbo-alternator, two 30 000 kVA transformers, two 15 000 kW reactance links, one 30 000 kVA busbar coupler equipment with and without reactance, and six 8 000 kW feeders. Specifications from the Borough Electrical Engineer, 18-24, Lower Clapton Road, E.5; deposit £3.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, W.S.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY CO., July 26th.—Supply of electric overhead travelling cranes etc. Forms of tender and specification (£1, not returnable) from Mr. S. G. S. Young, secretary, 91, Petty France, Westminster, S.W.1.

MIDDLEBURG (S. AFRICA) MUNICIPALITY, July 29th.—Supply and erection of steam raising plant, steam driven alternator, condensing plant, 6 600 V. transmission line and switchgear. (Reference B.X. 5 348.)

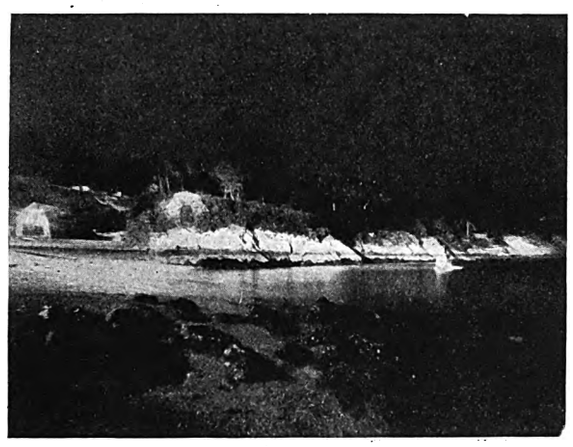
NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 30th.—Motor driven centrifugal pump, to deliver 400 gallons per minute against total head of 50 feet, the motor to be wound for 230 V d.c. (Reference A.X. 8 150.)

Digitized by Google

CAPE TOWN MUNICIPALITY, July 31st.—Supply of paper-insulated, lead-sheathed cables (specification No. 467/1929). (Reference B.X. 5 486.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, August 1st.—One 10-ton electrically-driven overhead travelling crane, for Maritzburg workshops (tender No. 1 487). (Reference A.X. 8 105.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 1st.—Supply of telephone cable (tender No. 160). (Reference B.X. 5 345.)



THE bathing beach adjoining the medical baths at Torquay, where over 20 B.T.H. type 599 projectors fitted with 1 000 W. gasfilled lamps and colour screens are used for illumination of rocky portions of the cliffs and of the beach. Projectors with flame-colour screens are employed, while green screens are fitted to those units which are trained on the shrub-covered parts of the cliffs and to projectors provided to illuminate the sea.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor, overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

NEW ZEALAND POSTS AND TELEGRAPHS, August 7th.—Enamelled and silk-covered resistance wire (No. P. and T. 151/1 497). (Reference B.X. 5 322.)

PORT ELIZABETH MUNICIPALITY, August 8th.—One 250 kVA, 3-phase, self-cooled type, indoor transformer (specification No. 30). (Reference B.X. 5 487.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 8th.—Telegraph material, including g.i. tubular side-arms, insulators, paper sleeves, insulator spindles, etc. (tender No. 161). (Reference A.X. 8 112.)

CHILEAN MINISTRY OF MARINE, August 9th (extension of time).—Supply and erection of two aerial towers for new wireless station at Arica. (Reference A. 8 244.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, August 12th.—Supply and erection at Burrinjuck of auxiliary hydro electric generating plant. (Reference B.X. 5 365.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 13th.—Supply of electric power plant, with underground and overhead network, for the town of Maghagha, Minieh Province. (Reference B.X. 5 318.)

MADRAS AND SOUTHERN MAHRATTA RAILWAY CO., LTD., August 13th.—Supply of 70 a.c. motors and starters, with spares, for Perambur works remodelling. Forms of tender (£1, not returnable) from the Company's Office, 25, Buckingham Palace Road, London, S.W.1.

Telegraph Stores Contracts.

NEW ZEALAND POSTS AND TELEGRAPHS, September 7th.—Supply of v.i.r. wire. (No. P. and T. 151/1 573.) (Reference B.X. 5 416.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 10th.—Two-conductor cores (P. and T. 151/1 600). (Reference B.X. 5 462.)

LOURENCO MARQUES PORT AND RAILWAYS, September 11th.—Battery tractors and trailers. (Reference A.X. 8 172.)

BULAWAYO MUNICIPALITY, September 13th.—Supply of h.t. overhead transmission lines, stepdown transformers, pumps with motors, etc. (Reference A.X. 8 181.)

AUCKLAND (N.Z.) ELECTRIC POWER BOARD, September 16th.—Supply of automatic sub-station at Remuera (two 500 kW machines and switchgear); automatic sub-station at Point Chevalier (two 1 000 kW machines and switchgear); 22 000 V switchgear; 6 600 V switchgear, and supervisory control apparatus. (Reference B.X. 5 506.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 23rd.—Electric light installation and distribution system for the town of Kafr-el-Cheikh (Gharbick Province). (Reference B.X. 5 502.)

INVERCARGILL (N.Z.) BOROUGH COUNCIL, September 23rd.—Supply of draw-out truck type or totally armour clad type switchboard, for controlling 11 000 V, three-phase, 50-cycle current. (Reference B.X. 5 507.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, September 24th.—Supply of condensers (schedule C. 461). (Reference B.X. 5 488.)

DURBAN CORPORATION, September 27th.—Supply of three-phase ironclad, compound filled switch panels (specification S. 778). (Reference B.X. 5 505.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply, erection and maintenance of coal conveying plant. Specification (No. 29/68) from the Agent-General, Victoria House, Strand, London, W.C.; deposit, £2 2s.

EGYPTIAN MINISTRY OF PUBLIC WORKS (TANZIM DEPARTMENT), October 1st.—Supply of electric lamp standards. (Reference A.X. 8 251.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 15th.—Seven 5 500 kVA single phase auto-transformers, with accessories, for Waitaki power scheme. (Reference B.X. 5 417.)

Tenders Accepted.

GENERAL POST OFFICE.—Edison Swan Electric Co., Ltd., supply of cells.

DEWSBURY CORPORATION.—Greenwich Cable Co., Ltd., cables, £1 028 10s.

AYLESBURY CORPORATION.—English Electric Co., Ltd. 15 transformers, £477 5s.

SHEFFIELD CORPORATION.—Bruce Peebles and Co., Ltd., supply of transformers, £386.

ADMIRALTY.—Edison Swan Electric Co., Ltd., combined switch and socket and plugs.

ENNISKILLEN URBAN DISTRICT COUNCIL.—Enniskillen Electric Lighting Co., public lighting.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL.—Edison Swan Electric Co., Ltd., supply of electric lamps.

STIRLINGSHIRE COUNTY COUNCIL.—J. & J. Duff, wiring houses for electric light at Plean, Cowie, and Fallin.

HULL CORPORATION.—J. C. Couleham, electric light installation at central library extension, £662 (Recommended).

GLASGOW CORPORATION.—P. R. Jackson and Co., Ltd., armature coils; Edgar Allen and Co., Ltd., tramway points and crossings.

EPSOM URBAN DISTRICT COUNCIL.—English Electric Co., Ltd., l.t., d.c. switchboard, £945, plus erection on time and material basis.

LONG SUTTON URBAN DISTRICT COUNCIL.—Boston Electricity Supply Co., street lighting by 60 W lamps, £3 2s. 6d. each per annum.

MARAZION PAROCHIAL CHURCH COUNCIL.—West Cornwall Electric Light and Power Co., electric lighting in parish church and church hall.

GREAT WESTERN RAILWAY CO.—Electrical Apparatus Co., Ltd., provision of controllers and resistances 50-ton cranes at locomotive works, Swindon.

BROADSTAIRS URBAN DISTRICT COUNCIL.—Isle of Thanet Electric Supply Co., Ltd., lighting 13 lamps in new arterial road, £9 per lamp per annum.

ROBERT GORDON'S COLLEGE, ABERDEEN.—Bell and Robertson, Ltd., electrical work in connection with erection of new McRobert Hall at the College.

BASINGSTOKE CORPORATION.—British Thomson-Houston Co., Ltd., additional electrical plant, £2 718. Ten tenders were received; highest £3 832.

HULL TELEPHONES COMMITTEE.—Equipment and Engineering Co., Ltd., insulators, £83 2s. 6d.; Ericsson Telephones, Ltd., switchboards, £84 16s. 6d.

HULL CORPORATION.—A. Shaw and Son, electric light and bell installation required at Maternity Home and Infants' Hospital, Hedon Road, Hull, £2 079.

READING CORPORATION.—Hy. Willis and Son, Ltd., supply and installation of electric blowing apparatus for organ in large Town Hall; Reading Electric Supply Co., Ltd., electric wiring in connection with same.

GLASGOW CORPORATION.—M'Geoch and Co., Cartwright and Sons, Brown and Co., Z. Electric Lamps and Supplies,

Digitized by Google

Sloan Electrical Co., Malcolm and Allan, T. Land and Sons, Bayley, March and Newry and Credenda Conduits, electrical fittings and accessories.

LEEDS CORPORATION.—Supply of cables, W. T. Henley's Telegraph Works Co., Ltd., £1 281 2s. 9d.; Enfield Cable Works, Ltd., £3 146; Macintosh Cable Co., Ltd., £5 313 7s. 1d.; Hackbridge Cable Co., Ltd., £2 700. William Wadsworth and Sons, installation of electric goods lift at town hall, £324.

BIRKENHEAD CORPORATION.—Transformers: English Electric Co., Ltd., five 100 kVA, £445; Brush Electrical Engineering Co., Ltd., one 200 kVA, £139; C. A. Parsons and Co., Ltd., one 300 kVA, £156. Cable: Liverpool Electric Cable Co., Ltd., £148 5s.; Hackbridge Cable Co., Ltd., £745. W. T. Henley's Telegraph Works Co., Ltd., erection of overhead lines to Wirral, at schedule rates.

ROTHERHAM CORPORATION.—A. Reyrolle and Co., Ltd., supply of two pairs of truck-type switches, £256 per pair; Metropolitan-Vickers Co., supply of spare armature, £215. (Both recommended.) Brown Boveri, Ltd., supply of rectifying plant, £2 375. (Recommended provisionally.) Electrical Engineer is to inspect plant at Delft, and if it is not considered satisfactory, the tender of the Hewittic Electric Co., Ltd., at £2 139, is recommended.

COLCHESTER CORPORATION.—Electric Construction Co., Ltd., one e.h.t. generator panel, two l.t. a.c. feeder panels, earthing cubicle, and cable connections, £1 650; W. T. Henley's Telegraph Works Co., Ltd., e.h.t. cable, £5 882 18s. 1d. supply and erection of overhead l.t. distribution lines (4 480 yd.) and poles in the Wivenhoe urban district, £2 493 16s.; and e.h.t. and l.t. cable, £13 107 19s., subject to disc. 5 %; Crompton Parkinson, Ltd., three 11 000 V and 6 600 V kiosks, £1 274 12s. 6d.

LIVERPOOL CORPORATION.—Mersey Welding Co., electric welding of 600 tramway rail joints, 11s. per joint; Premier Electric Welding Co. (Mersey), Ltd., 700 joints, 11s. per joint; Murex, Ltd., 100 joints, 35s. per joint; Mersey Welding Co., Ltd., welding and retreading 350 tramway rail joints and retreading rail heads, 11s. per joint and 11d. per lin. in.; 500 lin. in. of railhead surfaces, 1s. per in.; Ferguson, Pailin, Ltd., supply and erection of two h.t. metal-clad switch units at Waterloo sub-station, £741.

MANCHESTER CORPORATION.—Etchells, Congdon and Muir, Ltd., supply of electric goods lift; Rail Welding Co., Ltd., Delmez rail grinder; Metropolitan-Vickers Electrical Co., Ltd., traction motors, automatic circuit breakers and lightning arresters; British Thomson-Houston Co., Ltd., controllers; Rheostatic Co., Ltd., resistances; English Electric Co., Ltd., magnetic sanders. Maitland and Co. (Manchester), Ltd., electric light installations at Chorlton baths and at Newton Street police station. R. Seddon and Sons, electrical installation at Mobberley open-air school.

HAMMERSMITH (LONDON) BOROUGH COUNCIL.—British Electric Transformer Co., Ltd., supply of (*a*) four 1 000 kVA transformers, £1 590, and (*c*) one 50 kVA transformer, £204 15s.; Hackbridge Electric Transformer Co., Ltd., supply of (*b*) two 500 kVA transformers, £456. (All recommended.) British Electric Transformer Co., Ltd., tendered for (*b*) at £534, and the Hackbridge Co. for (*a*) at £1 380 or £1 640. Also tendered: Foster Engineering Co., Ltd., (*a*) £1 524, (*b*) £480, (*c*) £243; Ferranti, Ltd., (*a*) £1 770, (*b*) £504, (*c*) £183; Yorkshire Electric Co., Ltd., (*a*) £1 276, (*b*) £472; Bruce Peebles and Co., Ltd., (*a*) £1 396, (*b*) £460.

Work and Materials for London Councils.

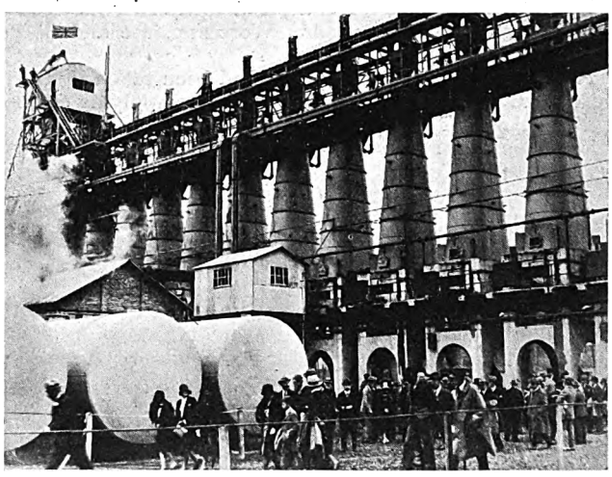
BATTERSEA (LONDON) BOROUGH COUNCIL.—Babcock and Wilcox, Ltd., pipework for boilers at power station, £1 495; Callender's Cable and Construction Co., Ltd., supply of three feeder pillars, £290 2s. 6d.; General Electric Co., Ltd., l.t. switchgear, for Lavender Hill sub-station, £322; Bertram Thomas, l.t. panel for sub-station at Albert Bridge flour mills, £95; Ferguson, Pailin, Ltd., kiosk, with transformer and switchgear, for Battersea Park area, £336 18s.; A. Reyrolle and Co., Ltd., h.t. switchgear, £408 1s.; and General Electric Co., Ltd., l.t. switchgear, £244, for Chatham House sub-station; British Electric Transformer Co., Ltd., supply of 500 kVA transformer for Chatham House sub-station, £297. (All recommended.)

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Revo Electric Co., Ltd., supply of electric irons, 8s. 3d. each; City Electrical Co., wiring flats at Drummond Crescent, £245; F. and E. Pickering, wiring flats at Thanet House, etc., £652; E. S. Russell and Co., wiring flats at Hastings House, £227 14s. 6d.; Hackbridge Cable Co., Ltd., supply of l.t. cable, £4 359; W. H. Allen, Sons and Co., Ltd., supply of electrically-driven condensing water pump, £2 050; Metropolitan-Vickers Electrical Co., Ltd., supply of 1 000 kW motor-convertor, for Grafton Road sub-station, £2 740 2s.; Babcock and Wilcox, Ltd., carrying out scheme to prevent emission of grit and dust from power station, £3 250 (estimated); General Electric Co., Ltd., supply of electric kettles, 19s. 10d. each. (All recommended.)

COAL DISTILLATION.

Electrical Equipment of the Bussey Coal Distillation Plant.

THE Bussey coal distillation plant at Glenboig—the largest installation of its kind in the world—was opened on July 19th by Viscount Elmley, M.P. This plant consists of fourteen retorts capable of dealing with a total of 700 tons of coal per day, which is converted into about 450 tons of semi-coke residue, 20 000 gallons of oil and 20 million cubic feet of gas. The retorts are fed and operated by Parkinson "Klosd" motors which are automatically controlled, as to speed, by heat variation in the process. Conditions for electrical plant are particularly severe, since the motors are mounted at the base of the retorts and are exposed to the heat of the retort on one side and open to the weather on



A general view of the retorts at Bussey.

the other. The motors drive through reduction gearing, and the control panels are let into the railings of the operating gallery.

Current supplying the motors is obtained from a 250 kW "Crompton Parkinson" reversible frequency changer, which is provided with a rocking stator, enabling it to synchronise with oil engine driven alternators. The frequency changer runs from the 25 cycle system of the Clyde Valley Electrical Power Company; when the 50-cycle oil engine driven alternators are generating, the frequency changer, operating in reverse, supplies 25 cycle current to adjacent firebrick works.

The main switchboard and distribution switchgear, motor generator sets for laboratory use, and motors for water and oil-pumping duties are also of Crompton Parkinson make.

On the occasion of the opening ceremony Viscount Elmley closed a pilot switch which started up the frequency changer, followed by the motors driving the retorts.

EXPORT PACKING OF ELECTRIC COOKERS.

In contrast with the photographs of American methods of packing electric cookers, published in our last issue, we now publish photographs of English methods of packing for export, which show that America has not the monopoly of ingenuity and thought in this direction. The method of packing a single cooker illustrated on another page is similar to the American method, except that the cooker is not bolted to the base board, but is secured by close fitting battens, and the legs, etc., are securely packed inside the hot chamber of the oven, instead of being fastened to the case. When we come to the method of packing two cookers in one case, we see that the problem of packing has not been left until after manufacture, but has been thought out in the early stage of the actual designing of the cooker, the oven and the hob having been so designed that two cookers nest into one another, and less space is occupied by a case containing two cookers than by two cases each containing a single cooker.

(See p. 111.)

ELECTRICITY SUPPLY.

Proposed Supply for Oakham Rural District—The Hereford Undertaking—Supply in the Isle of Man—Sidmouth Undertaking—Supply for the Becontree Estate—Extension of Mains at Swansea—Newport and the West Midlands Joint Authority.

WEST Bromwich T.C. has applied for a loan of £30 000 for mains.

Bedford Electricity Committee has authorised mains extensions at a cost of £1 650.

Lowestoft Corporation has voted £2 500 for providing for the electric lighting of Normanston Drive.

Canterbury Corporation has applied for a loan of £5 000 for a new feeder cable and other mains extensions.

Swansea Electricity Committee seeks sanction to borrow £150 000 for mains and services and £10 000 for meters.

Mr. R. Borlase Matthews is seeking powers to supply electricity in an area which will include Oakham rural district.

Barnsley Electricity Committee has obtained sanction to borrow £6 693 for mains, services, and sub-station equipment.

Chichester Corporation has applied for a loan of £8 000 for past and prospective expenditure on unspecified distribution works.

Hereford City Council has decided to transfer its electricity undertaking to the Shropshire, Worcestershire and Staffordshire Electric Power Co.

It is announced that final steps had been taken by Stirlingshire Central District Committee towards supplying electricity to the villages of Fallin, Plean, and Cowie.

The Electricity Commissioners have sanctioned the borrowing by Croydon Corporation of £37 846 for mains, transformers, switchgear, generating plant, and sub-station buildings.

Aylesbury T.C. has received sanction to a loan of £3 000 for meters, and has applied for a loan of £1 787 for supplying the Manor House, Bradenham, for which a Fringe Order is being sought.

Barking U.D.C. is to lay a service to each block of the London County Council's houses on the Barking section of the Becontree estate free of cost to the L.C.C. and to supply current at ordinary rates. The cost of wiring the houses is estimated at £12 300.

An application to the Commissioners is to be made by Uckfield R.D.C. for the revocation of the powers of the Uckfield Gas and Electricity Co. for the supply of electricity to Buxted and Hadlow Down, and for the transfer of the powers to the Weald Electricity Co.

Hastings Electricity Committee has obtained sanction to borrow £1 552 for the purchase of Messrs. Jenner and Simpson's electricity undertaking at Battle.—The Committee is seeking sanction to borrow £15 000 for mains and £10 000 for house wiring installations.

Stoke Newington (London) Electricity Committee recommends that meter rents and the charge for fuse calls be abolished except in cases of negligence or misuse of supply, and that scale E for power supply be reduced to 1½d. per kWh for the first 10 000 and 1d. for all beyond that consumption.

Godalming T.C. has arranged with the Urban Electric Supply Co. to supply the new Council houses at Binscombe Lane. Tenants will each pay a minimum of £3 per annum for 120 kWh, 3d. per kWh for the next 120, and 1½d. per kWh beyond. The company will carry out the installations free of initial cost.

Whitehaven Corporation is to carry out a scheme for the installation of electric light on the hire purchase system upon payment of a deposit of 20 % of the capital cost, and a flat rate charge 2d. per kWh free of meter rent, until a maximum consumption has been registered of 150 kWh for each £1 of the capital cost.

Leyton T.C. has received sanction to a loan of £24 590 for work in connection with the change-over from d.c. to a.c. A loan of £3 000 for the provision and equipment of a sub-station at Whipps Cross Hospital, and the laying of a new main from the Leyton Green sub-station to the new one, has been applied for.

Stockton-on-Tees T.C. has applied for loans of £8 550 in connection with supply for the housing scheme of Synthetic Ammonia and Nitrates, Ltd., £10 000 for mains and services, and £1 000 for assisted wiring. Arrangements have been made to give a temporary supply to the North Shore Shipyard to be opened by Smith's Dock Co.

Sidmouth U.D.C. has decided to sell its electricity undertaking to the Whitehall Securities Corporation, Ltd., for £35 000. It is stated that there will be a profit of nearly £18 000 on the deal. The purchasers have agreed to a maximum price of 9d. per kWh, whereas the Council was charging 11d. The Council is to get its current at 2½d. per kWh.

Newport (Salop) R.D.C. has been informed by the West Midland Joint Authority that that body has undertaken to give a supply to Wellington on December 1st, and that it is intended to have a supply available for Newport by February 1st. The prices will be 4½d. per kWh for lighting, and 1½d. for industrial purposes, with a fluctuation of ¼d. either way, according to the result of the canvass in regard to the demand.

Bradford Markets Committee has voted £520 for electric lighting improvements at Kirkgate market, and has instructed the City Electrical Engineer to obtain tenders. The Electricity Commissioners have issued sanction to borrow £50 000 on account, in connection with the reorganisation of the e.h.t. switchgear at the Valley Road power station, and the Central Electricity Board has suggested certain modifications in the scheme to make provision for the connecting of the grid to the Valley Road station.

The Law and Parliamentary Committee of Westminster City Council recommends that the Chelsea and Kensington Councils be invited to join in the promotion of a Bill in Parliament to revoke the consent given by the Electricity Commissioners to the erection of the London Power Co.'s Battersea station, and to prevent the Electricity Commissioners giving consent to the erection of any further super-electricity stations or the extension on a large scale of existing generating stations within the county of London.

Birkenhead Electricity Committee has agreed to accept Wallasey's offer to reduce the kW charge for the supply in bulk to Birkenhead from 18s. 9d. to 17s. per quarter. It will result in a saving to Birkenhead of about £2 000 a year.—Birkenhead Electricity Committee has received sanction to borrow £1 754 for h.t. main extensions to Leighton Hall Estate kiosk and the Pensby kiosk.—The Committee has adopted the Electrical Engineer's scheme for electrical installations to be paid for through automatic meters.

Stoke Newington (London) B.C. considered last week Mr. A. M. Sillar's report on the best means of meeting in future the rapid increase in the demand for electricity in the borough. Mr. Sillar suggested that the d.c. supply be augmented by the provision of two new sub-stations equipped with modern converting apparatus, that one of these sub-stations (in the Southern portion of the borough be supplied by the Edwards Lane station through a 10 000 V ring main and the other in the northern part of the district) through a single 10 000 V main, and the provision of new distribution cables from the sub-stations was also proposed. The Council adopted the scheme in principle, and decided to apply for sanction to a loan of £30 000.

Battersea (London) Electricity Committee has now confirmed the provisional arrangements made with the Central Electricity Board as to the site for the transforming station at the generating station. The switch house will be constructed by the Council, and it is proposed to make it sufficiently large for the Council's future plant as well as that of the Board.—The Committee has decided to arrange for supply in the Portslade Road district, at a cost of £6 162, and has granted an application from the Foundation Co., Ltd., for a supply of electricity in connection with its contract work at the London Power Co.'s generating station at Nine Elms. The cost of the necessary e.h.t. mains, switchgear, and transformer will be £1 658.

The Electricity Committee appointed by the Governor of the Isle of Man to consider the question of a supply of electricity to parts of the island not already served has issued its report. The Committee finds that it is economically possible to supply the areas in question at an average price of 4·2d. per kWh, dropping to 3·5d. as the consumption gradually increases. The alternative methods of supply are to obtain electricity in bulk from Douglas Corporation, or to set up an all-island hydro-electric station. The only suitable source for hydro-electric power is the water power in Sulby Glen, and to set up this would mean an annual cost of £10 000. It is recommended that a supply be obtained at the outset from Douglas Corporation. It is recommended that a concession be granted to the Electric Development Trust for a term of years—50 years is suggested.

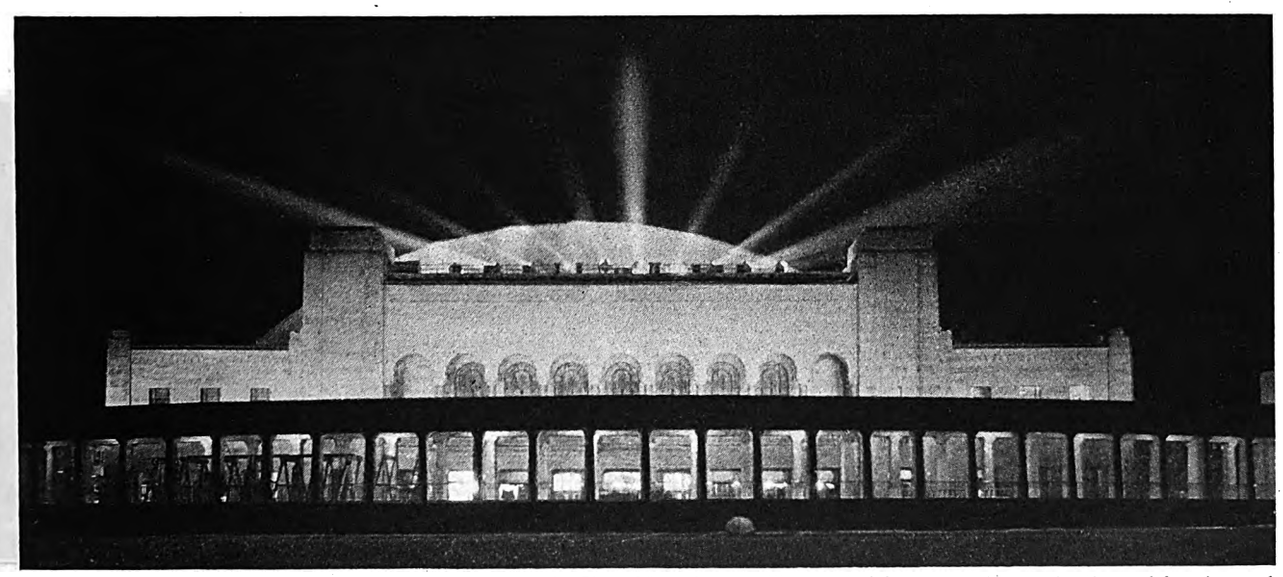
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

The London Technical Group of the Electrical Power Engineers' Association paid a visit to the works of the Hackbridge Electric Construction Co., Ltd., and the Hewittic Electric Co., Ltd., at Hersham, Walton-on-Thames, on July 6th. Details of the proceedings and a list of the more important plant inspected are given on page 115.

Under special arrangements introduced by the Post Office for the extension of telephone facilities in rural areas, there has been opened at Longhoughton, Northumberland, the first rural automatic exchange in N.E. England.

At a new estate off Selsdon Road, South Croydon, all-electric houses are being erected, and sell immediately. Such houses are easily recognisable, because the roofs are devoid of chimneys.



The new Auditorium and Convention Hall at Atlantic City, New Jersey, illuminated in connection with the celebrations of "Light's Golden Jubilee." The hall is claimed to be the largest in the world, and has seating accommodation for 41 000 persons. The Festival of Light came into being when Preston S. Arkwright, President of the N.E.L.A., pressed a button in the auditorium, which brought into operation a searchlight on the roof. Upon the release of this signal, the pilot of an aeroplane, hovering overhead, released a wind-driven siren, the note of which was picked up electrically and then actuated the floodlight control of the building.

COMPANY NEWS.

Fa llof Cables and Wireless Stock Prices—W. T. Henley's Telegraph Works Co.'s Fiftieth General Meeting—Western Union Telegraph Co.'s Increased Revenue—Metropole Gramophone Co.'s Change of Name—Reports and Dividends.

CABLES and Wireless descriptions, the quotations for which a week ago appeared to have settled down at round about 90, have been sold during the first week, the "B" ordinary dropping to 80 and the "A" ordinary to 84½. In the electrical manufacturing department, British Insulated Cables ordinary, at 75s., are 2s. 6d. down, Electrical Constructions have fallen from 16s. 3d. to 15s., and Ever-Readies from 19s. 6d. to 18s. General Electrics and Siemens shares are also a little lower. Yorkshire Electric Power ordinary shares have improved 6d.; County of London are 2s. down.

SCOTTISH POWER CO., LTD.—Subscriptions were invited last week for an issue of 1 000 000 £1 ord. shs. at 25s. p. sh.

CHELSEA ELECTRICITY SUPPLY CO., LTD.—Intm. div. of 10 d. p. sh., less tax, on ord. shs. will be payable on Sept. 10.

SMITHFIELD MARKETS ELECTRIC SUPPLY CO., LTD.—Intm. div. of 3%, less tax, on ord. shs. will be payable on Aug. 13.

COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD.—Intm. div. of 3%, less tax, on ord. shs. will be payable on Sept. 16.

BOURNEMOUTH AND POOLE ELECTRICITY SUPPLY CO., LTD.—Intm. div. of 6%, less tax, on ord. shs. will be payable on Aug. 15.

SOUTH LONDON ELECTRIC SUPPLY CORPORATION, LTD.—Intm. div. of 3%, less tax, on ord. shs. will be payable on Sept. 16.

SOUTH METROPOLITAN ELECTRIC LIGHT AND POWER CO., LTD.—Intm. div. of 3%, less tax, on ord. shs. will be payable on Aug. 31.

RICHMOND (SURREY) ELECTRIC LIGHT AND POWER CO., LTD.—Intm. div. of 4%, less tax, on ord. shs. will be payable on Aug. 15.

BROMPTON AND KENSINGTON ELECTRICITY SUPPLY CO., LTD.—Intm. div. of £4 3s. 4d.% (10d. p. sh.), less tax, has been declared.

HYDRO-ELECTRIC SECURITIES CORPORATION.—Semi-annual div. at rate of 5% p.a. on 5% class "B" participatg. pfd. stk. will be payable on Aug. 1st.

HERBERT MORRIS, LTD.—Full div. for half-year to July 31, 1929, on the 6% (less tax) and the 5% (tax free up to 6s.) cum. pref. shs. have been declared.

MATHER AND PLATT, LTD.—Div. at rate of 5% p.a. on pref. shs. for half year ended June 30 last, and intm. div. on ord. shs. of 5% actual, tax free, for same period are announced.

CABLE, TELEPHONE AND GENERAL TRUST.—Divs. on 6% cum. pref. shs. for six months ended June 30 and 3½% on "A" 7% non. cum. pref. shs. for same period will be payable on Aug. 1.

LONDON ELECTRIC SUPPLY CORPORATION, LTD.—Intm. divs. at rate of 6% p.a. (3s. p. sh.), less tax, on the 6% £5 pref. shs. and at rate of 8% p.a. (9·6d. p. sh.), less tax, on £1 ord. shs. for six months ended June 30, 1929, will be payable on Sept. 2.

WESTERN UNION TELEGRAPH CO.—Gross revs. for six months ended June 30, 1929, were $72 610 036, agst. $67 276 475 for correspondg. six months of 1928; total exes. were $63 296 470, agst. $58 169 072; int. on bonded debt required $1 805 033, agst. $1 802 245; net income was $7 508 533, agst. $7 305 158.

OFFICIAL QUOTATIONS.—Stock Exchange Committee has granted official quotations to 26 950 £1, fully paid, ord. shs. of the Anglo-Portuguese Telephone Co., Ltd.; £3 000 000 4% stk. and partly paid scrip of the Central Electricity Board; 13 035 £1, fully paid, ord. shs. of the Underground Electric Railways Co., of London, Ltd.

BRAZILIAN TRACTION LIGHT AND POWER CO., LTD.—Gross earngs. from operatn. of the tramway, electricity supply and other services operated by subsidiary cos. for June, 1929, amtd. to $4 210 893, increase $579 564. Aggregate gross earngs. from Jan. 1, $24 037 025, increase $3 498 065; and net earngs. $13 760 385, increase $1 864 446.

WEST GLOUCESTERSHIRE POWER CO.—This co. invited subscriptions last week by holders of the 6½% participatg. pref. stk. for an additional £85 000 6½% participatg. pref. shs. of £1 each at par, which are to be converted into stk. The British Empire Trust undertook to subscribe any portion of the new shs. which might not have been subscribed by to-day, July 26th.

KIDDERMINSTER AND DISTRICT ELECTRIC LIGHTING AND TRACTION CO., LTD.—Net receipts and other rev. for 1928 amtd. to £9 769, agst. £9 994, plus £505 brt. in. After provisn. for administratn. and gen. exes. and int. on temporary loans, blce. is £7 376. To depreciatn. and res. £2 080, div. on 5% pref. shs. for year, £2 500; div. on ord. shs. of 5% for year, £2 350; fwd. £446.

AMERICAN TELEPHONE AND TELEGRAPH CO.—Divs. received by co. during six months ended June 30 last amtd. to $66 341 283, compared with $57 551 183 for first half of 1928. Telephone operating revenue was $54 847 044, agst.

Digitized by Google

$48 495 536, total rev. $130 899 849, compared with $112 686 085. Net earngs. increased from $79 555 980 to $92 149 775, available total, after allowing for int., being $80 202 095, compared with $68 671 768.

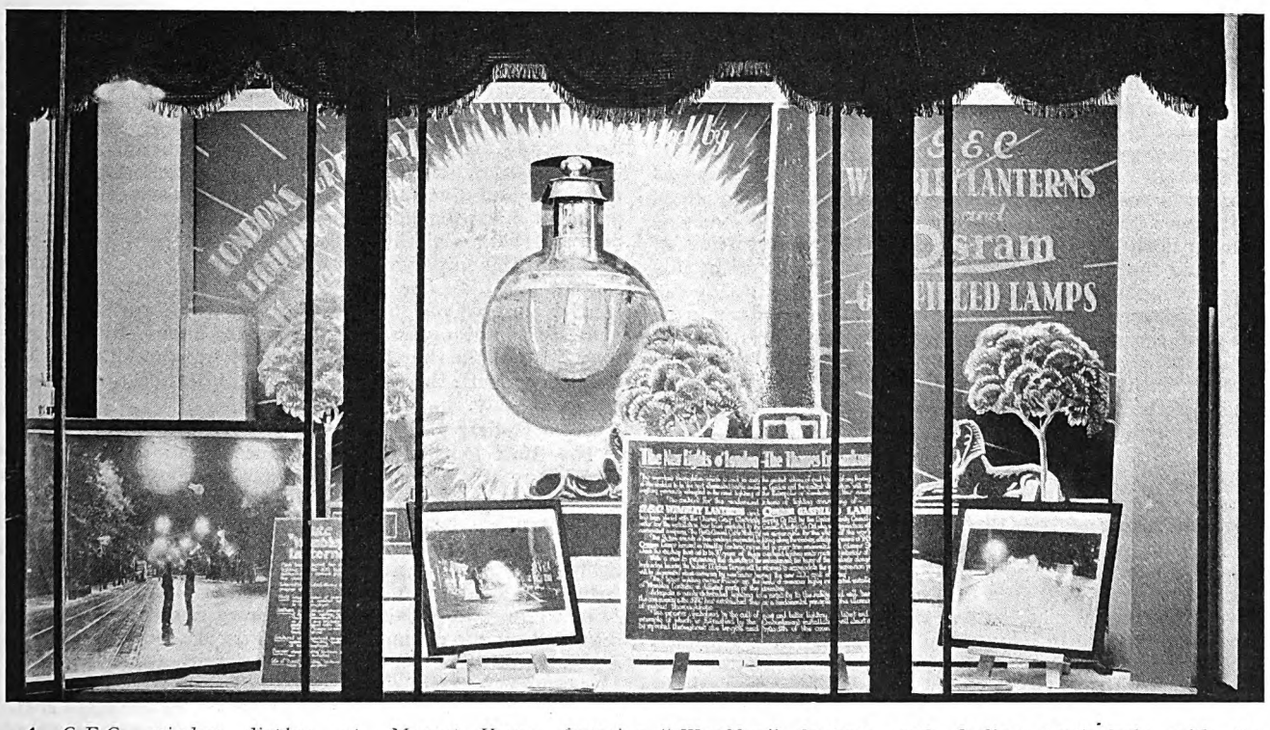
City of San Paulo Improvements and Freehold Land Co.—Rpt. for year ended Feb. 28, 1929, states that a contract has been entered into between the State of San Paulo and the San Paulo Tramway Light and Power Co. for a large extsn. of the hydro-electric scheme of the latter co., the carrying out of which will entail the canalisatn. of the River Pinheiros and the drainage of the large area of the low-lying lands belonging to the co. This should enhance the value of these lands.

Anglo-Argentine Tramways Co., Ltd.—Gross receipts in 1928, £4 719 180, agst. £4 658 617; exes, £3 693 048, agst. £3 646 977. Passengers carried, 570 079 027, agst. 560 747 554. Deductg. exes. from receipts left surplus is £1 026 132, agst. £1 011 640, and, after deductg. deb. service and other requirements and addg. amt. £61 216 brt. fwd., there was a blce. of £444 928. After allowg. for 1928 divs. on two classes of pref. shs., there remains £85 928, which it is proposed to carry fwd. Working exes. were 73·50% on receipts, agst. 74·57. Renewals expndtre. was £279 742, agst. £335 473. To renewals res. £372 416, agst. £368 666. Rpt. again refers to competitn. in Buenos Aires by motor omnibuses. Co.'s own 'bus services have run at a loss, but provided a valuable auxiliary to other services. Co.'s *ad referendum* agreemt. on subject of tariffs has not yet received necessary ratificatn. of Municipal Council. Pressure of the general traffic situatn. and consequent need of underground line extensns. render this step one of ever-increasing urgency, and it is hoped that it will be dealt with definitely at an early sessn. of the council.

Company Meetings.

Oswestry Electric Lighting and Power Co., Ltd.—At the annual general meeting, on July 16th, the report and accounts were adopted and the dividend of 10% was approved. The report stated that Oswestry Borough Council had given notice to exercise its option to purchase the company's undertaking when its period of tenure expires. Income for 1928 was £10 141, and after provision for all charges, including depreciation, the balance was £1 145, plus £743 brought in. The dividend absorbed £640, leaving available balance, £1 248. The electricity generated and purchased was 598 659 kWh, increase 112 947, and total connections increased from 519 to 774 kW.

Metropole Industries.—At the first annual general meeting of the Metropole Gramophone Co., Ltd., on Monday, the Marquis of Winchester (chairman) said the ordinary general meeting would be followed by an extraordinary meeting, the object of which was to change the name of the company to bring it more in conformity with their present activities. Their cash position, amounting to £164 762, was a strong one. Investments in subsidiary and other controlled companies, at cost, amounted to £86 238. They had written down patents and trade marks to a nominal figure of £1, and had written off preliminary, underwriting and issue expenses, expenditure on advertising, loss on trading, etc., amounting to £94 146. At the statutory meeting of Everlite, Ltd., he had predicted that that company would produce Everlite lamps by the end of April. They did produce several thousand lamps in that month. These were made of metal, and, after careful consideration, the directors decided to defer marketing this lamp, which was not considered the best that the company could produce, until such time as they were able to make it of Metduro instead of metal. The company had now produced standard cycle lamps made in Metduro, and the directors were satisfied that they could offer these to the public as a cheap and reliable lamp. The lamps would shortly be available at the showrooms of the company, which were being got ready at Metropole House. The Metduro Co. acquired in March last a freehold property at Waltham Abbey consisting of 24½ acres of land, together with substantial and well laid out factories and buildings, covering about eight acres of ground. It had been found possible to let off a portion to the Everlite Co. and to the Metropole Gramophone Co. The remaining buildings were available for the Metduro Co. In handling new commercial discoveries or inventions the first question to be decided as a policy was what line one's first production should take. In the case of Metduro they were laying themselves out to supply: —(*a*) the Everlite lamp container, and (*b*) electrical requirements such as tubes, rods and sheets for switchboard purposes. The material had been tested by the two leading testing institutions—the National Physical Laboratory and Faraday House. Their reports showed that Metduro was suitable for all grades of insulating material. The company is making satisfactory progress towards the attainment of commercial production. At a subsequent extraordinary general meeting it was resolved: "That the name of the company be changed to Metropole Industries, Ltd."



A G.E.C. window display at Magnet House, featuring "Wembley" lanterns, and dealing particularly with the recent opening of a section of the new Thames Embankment lighting by means of these lanterns. The display, featuring a 1 500 W lantern illuminated throughout the day and night, has created a tremendous amount of interest, and crowds have congregated around these lighting details of the new scheme. The setting was accompanied by some actual enlargements of night photographs secured on the Embankment recently by means of the new system of lighting.

W. T. HENLEY'S TELEGRAPH WORKS CO., LTD.

Record Results of Fiftieth Year's Work—Satisfactory Operation of Arrangement with Other Companies—Bonus for Hourly-Paid Workers.

THE 50th ordinary general meeting of W. T. Henley's Telegraph Works Co., Ltd., was held at the Abercorn Rooms, Great Eastern Hotel, London, E.C.2, on Friday, July 12th.

SIR GEORGE SUTTON, Bart. (Chairman), said: Ladies and Gentlemen, the report is in your hands, and I assume that you will take it as read. I am not going to detain you very long this morning, because I recognise that the temperature is not equable and I do not think that there is anything in connection with this company that will be objectionable to anybody. The accounts presented to you as has been the custom at the annual meetings of shareholders for the last few years show the comparison with the previous year's figures, so it is not necessary for me to refer to very many of the items.

Now coming to the profit and loss account, the figures do not differ very greatly from last year's. As to depreciation, the important item of machinery is £47 800 and in addition to that the business has spent £34 500 for maintenance of plant and maintenance of the property generally, which is not shown separately in the accounts although naturally included in the general accounts. The amount written off for depreciation and maintenance comes to the large sum of £82 000.

Increased Carry Forward.

I think the shareholders must be satisfied with the board's stewardship in their interests, and if you adopt the recommendations they make to you this morning there will be a balance carried forward to the unknown future of £545 000. That is rather larger than the balance brought in. I think the balance brought in was £532 930. Now no doubt the shareholders will, as usual, wish to know how this prosperous state of affairs has arisen? It is really a matter of secondary importance to the shareholders. Of first importance is the amount of dividend they are going to get. Of course, that is made up by the prosperity of the company and I will briefly deal with the main causes for this very fine account which you have before you. I suppose we must, in the first place, put the goodwill of the company, the goodwill which has been made by many, many years of hard work and good service. And then, in the next place, I should place the organisation We have a very wonderful organisation in this business. That has been built up during half a century. You cannot build an organisation—a good, a nearly perfect organisation—in half a dozen years and this has been built up in 50 years with a growing business all the time. That organisation enables your staff to follow the course of the manufacture and the sales, and to direct the business in those channels which is to be preferred. The industry is a very live one and the turnover during the past year has been a record. I do not like the word record, but I do not know a better one to use. We have so many records now. It is the largest business that this company has ever done in its turnover. The home and overseas trade have both contributed to it; it will be interesting to you to know that—the overseas trade to which we all in this country are looking so much to restore the industries of the country, the overseas trade of Henley's represents about 40% of the total turnover of the business.

Two years ago I reported to you that we had entered into agreements with two or three other cable manufacturers—working agreements in regard to manufacture, research and so on. Last year I said nothing at all about these agreements; I felt that sufficient time had not elapsed to enable us to form an opinion as to how they would work. Now we have had two years' experience, and I think it is due to you to know something of how that arrangement has turned out in the interests of this company and in the interests of our British cable industry. The difficulties have been very great; I do not want to conceal that. It has been to me personally a time of very great anxiety—these two years—as to how these agreements would work. And even now modifications in the agreements may have to be made. But although we have not absolutely got into smooth seas the benefits already realised have been considerable. These allied undertakings were very individualistic in the control of their affairs; they always have been. To get the best out of an alliance we had to get a perfectly free interchange of methods of manufacture and organisation and the directions in which research was being made and the results of research. There had to be an endeavour to take the same interest in their line of business and they in ours as we took in our own. It has not been very easy to attain that atmosphere. The progress has perhaps been slow, but I assure you that it has been very sure. And there have been other firms who, knowing what we have been doing, have sought to join the alliance, and indeed one or two have already come in and negotiations are even now going on with certain other firms. Besides our endeavour to improve the methods of distribution of electricity—by that I mean, of course, our own cable business, the designing of electric cables and accessories to give increased efficiency—success has been achieved in the lowering of the cost of production. I want the shareholders to be under no misapprehension as to what that means to them. It does not mean that the lower cost of production is directly an increase of the balance on the profit and loss account available for dividends. The lower costs obtained by Rationalisation, which is the name applied to this sort of agreement, mean lower prices to meet competition both at home and abroad. They have a two-fold effect. They lower prices to the user or consumer, and so possibly they add to the demand. We know that the cheaper the articles are, no matter what the business, the demand increases. An increased demand also, of course, should bring increased business to the allies. It is this increased business by meeting competition and increasing demand that will bring more business to the allies and so add to the amount available for dividends shown by the profit and loss accounts. I do not want Henley's to be satisfied at the expense of competitors. We want to satisfy them as well as ourselves and I think we have a scheme that will do it.

I want to say a word with regard to the bonus which is referred to in the report. A resolution will be moved presently in regard to that bonus which the report states is to be paid to the hourly-paid workers. The report also states that other members of the staff are provided for by the prosperity of the company through the bonuses which are granted annually. The hourly-paid workpeople in the shops have not been provided for in the form of a bonus. It is rather difficult. We cannot put them on a profit-sharing scheme—such a scheme as we have for the permanent staff. You have a floating body, also, of workpeople; although the prosperity of this company has been so long and great that we have a very large permanent staff of hourly-paid workers. A large number of our people do not know what unemployment means. We have two or three funds which operate for their benefit. We have pension funds of a kind—not a trustee fund. We have benefit funds, benevolent funds and so on; and you may be assured from me that there is no case of hardship of any one of our workpeople, and no case of old age or retirement goes unheeded by the board of directors. The bonus will consist of two weeks' pay, based on a normal week of 47 hours, excluding any extra payment made for night work or overtime. It will be paid to men and women alike and to every hourly paid worker who is to-day in the employment of the company, and who has been for not less than one year ended 31st March this year—that is, the close of our financial period. The authority of this meeting is not necessary to pay this bonus, but the board thought that the shareholders themselves would like to identify themselves with the gift, and so the resolution appears on the agenda to-day.

Staff Pension and Insurance Fund.

The Staff Pension and Insurance Fund amounts to the large sum of £290 000, the greater part of which has been contributed by this company; and the expenditure on funds for employees last year—that is, the year under review—amounted to £58 000, of which £11 000 was national and compulsory, and £47 000 was voluntary on the part of you ladies and gentlemen.

The report and balance sheet were adopted and the final dividend on the ordinary shares of 2s. 6d. per share, less tax, and a bonus of 2s. per share, less tax, were approved.

Resolutions "*that unless and until otherwise determined by the company in general meeting, each of the directors shall, as from the 1st April, 1928, be entitled to additional remuneration at the rate of £500 per annum,*" and "*that this meeting of the shareholders of W. T. Henley's Telegraph Works Co., Ltd., cordially approves of the action of the board in marking the fiftieth anniversary of the company by granting a bonus to hourly-paid workers*" were also carried.

Satisfactions.

COURTIN AND WALSH, LTD., London, E.C., manufacturers of electrical fittings.—Satisfaction registered July 5th, £960, part of amount registered October 10th, 1928.

FERRANTI, LTD., Hollinwood, electrical manufacturers.—Satisfactions registered July 4th, trust deed registered August 9th, 1905; supplemental deed registered March 10th, 1910; and supplemental deed registered November 26th, 1912, all securing debenture stock fully satisfied.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

DUFFNER, J. and W., 116, Charlton Street, Euston Road, London, N.W.1, electrical engineers, etc. A meeting of the creditors of the above was held recently when the debtor's solicitor reported that the liabilities were £1 294, of which £493 was due to the trade and £801 to the debtor's father for cash advanced. The assets consisted of stock at cost £600, and book debts £40, making a total of £640, or a deficiency of £654. It was stated that the debtor commenced trading on his own account in July 1926 with stock to the value of £50, which he had purchased with his savings. The business had never been a very profitable one and the debtor's father had assisted him from time to time by making advances and also by settling creditors' claims. The present position was attributed to the fact that there had been alterations in the neighbourhood which had been detrimental to the trade carried on. The turnover had been about £30 a week, but it had recently fallen to £10 weekly. It was believed that if the business was continued it could be carried on profitably. The debtor had drawn nothing from the business and had supported himself by doing outdoor work.

It was decided that a deed of assignment should be executed in favour of Mr. E. H. Hawkins, of Poppleton, Appleby and Hawkins, 4, Charterhouse Square, E.C., with a committee consisting of the representatives of the Electrical Importers' and Traders' Association, Blundell Spence and Co., Ltd., and Falk Stadelman and Co., Ltd.

HIGHTENSITE AND EBONITE MANUFACTURING CO., LTD., Normandy Works, Custom House, E.16, insulated material manufacturers. The statutory meeting of creditors in the voluntary winding up of this company was held on July 18th at 8, Frederick's Place, Old Jewry, E.C., when Mr. A. A. Lough, C.A., the liquidator of the company, presided. According to the statement of affairs the liquid assets included stocks as valued by the manager, £2 492; sundry debtors put down at £2 320, and cash in hand, £8, making total liquid assets of £4 820, from which had to be deducted preferential claims amounting to £816, leaving net liquid assets of £4 004. Against that amount, however, there were debentures and interest outstanding amounting to £16 782, which showed a deficit of liquid assets so far as the debenture holders were concerned of £12 778. The unsecured creditors' claims amounted to £2 112, and there was a bank overdraft of £1 388. The fixed assets including the land, buildings, plant and machinery, cost in 1923 the sum of £7 396. The present book value as valued in 1927 as a going concern was £21 606.

The liquidator explained that the company was incorporated in 1923 to take over the business of the Hightensite Co., Ltd., which was then in the hands of the receiver for the debenture holders. The present company was formed with a capital of £3 002 paid up in cash and £10 000 worth of debentures also subscribed in cash. The business was purchased for £10 000, of which approximately £7 400 was the price for the land, buildings, plant and machinery, and £2 600 for the stocks. During the first two or three years to September, 1925, the company was fairly successful and made profits. In 1926 there was a heavy loss. In May, 1927, it became necessary to find additional working capital. In January of this year third debentures were issued for the sum of £1 400, which made a total issue of debentures of £16 400. The receiver was carrying on the business, and he wished if possible to sell it as a going concern. There had been negotiations carried out for the purpose of disposing of the business, but nothing definite had been arrived at at the moment. The debenture holder was the chairman of the company. The liquidator said that if an offer was received for the business he would call a further meeting of the creditors to see whether the unsecured creditors approved of the offer, and likewise if it was decided to sell the business by auction the creditors would again be invited by the liquidator to attend a further meeting. It was decided to appoint an informal committee of inspection consisting of three of the creditors. The matter remains in the hands of Mr. Lough as liquidator.

The following are creditors:—Buck and Hickman, £70; Bubell Bros., £158; Ebonite Containers, £88; L. M. S. Railway, £50; Osborn and Sons, £280; Fickering, A. H., £120; Rubber Regenerating, Ltd., £230.

KAY (P.), LTD., wireless factors, lately 183, Old Street, London, E.C. The statutory meeting of the creditors of the above was held on July 22nd at the Cannon Street Hotel, London, E.C. The chair was occupied by Mr. Philip M. Mordant, of Philip Mordant, Jarvis and Co., C.A., 115-117, Cannon Street, E.C., who reported that, following the appointment of a receiver for the debenture holders, the company went into voluntary liquidation, and appointed him to act as liquidator in conjunction with Mr. W. A. J. Osborne, of Corfield and Cripwell, Balfour House, Finsbury Pavement, E.C. The statement of affairs showed ranking liabilities of £4 481, of which £2 643 was due to the trade, and £1 838 to Mr. P. Kay and the members of his family in respect of cash advanced.

Digitized by Google

The assets were estimated to realise £3 115, from which had to be deducted £83 for preferential claims and £2 150 in respect of debentures and interest. The net assets therefore were £882, or a deficiency of £3 599. The assets comprised stock, £2 000; book debts, £1 050; fixtures and fittings, £25; and cash at bank, £40.

The chairman reported that Mr. G. C. Jarvis was appointed as receiver on May 15th last by the Court. The debenture holders were Mr. and Mrs. Kay. They each held a debenture for £1 000. The receiver was also the manager, and he carried on the business for the purpose of liquidating the stock. By July 5th the receiver had collected sufficient to satisfy the claims of the debenture holders, and voluntary liquidation then took place. Mr. Osborne was appointed as representing the trade.

Mr. P. Houstoun, of Corfield and Cripwell, stated that the stock at cost or market value amounted to £2 781, whilst the gross value of the book debts was £1 625. The fixtures and fittings appeared in the books at £148. The company was registered in March, 1928, with a nominal capital of £5 000 in £1 shares, and Mr. Kay subscribed £1 000 for shares and also found a further £2 000 for which he was given debentures. At the date of the liquidation Mr. Kay and his family were cash creditors for sums aggregating £1 838. The company had carried on both a wholesale and retail business, with a gross profit of approximately 10 or 11 per cent. Since the commencement the turnover had been something like £23 000. The receiver had realised £2 821, and after satisfying the debentures, costs and trading payments, it was estimated that there would be £100 to £200 to come to the liquidators, and book debts of £300. In other words, the assets available for the creditors would probably be £400 to £500.

In answer to a question, it was stated that the assets had been disposed of in the ordinary way of trade, and had not been slaughtered. Mr. Kay stated that he was prepared to withdraw the cash claims totalling £1 838, and a resolution was passed confirming the voluntary liquidation of the company with the present liquidators, and a committee. The representative of one of the French creditors stated that he had instructions to present a petition if there was a dividend of less than 10s. in the £.

London Gazette, etc.

Company Winding-up Voluntarily.

DECORATIVE LIGHTING, LTD. By reason of its liabilities, July 12th. T. Taylor, 12, Wood Street, Cheapside, London, E.C., appointed as liquidator.

Bankruptcy Information.

BAINES, Gerald Talbot, 66, High Street, Gorleston, Suffolk, electrical engineer. First meeting, July 27th, 12 noon, Official Receiver's Office, 9, Queen Street Chambers, Norwich. Public examination, September 19th, 10.15 a.m., Town Hall, Great Yarmouth.

PENMAN, Alexander N., electrical engineer, 35, Ivanhoe Crescent, Wishaw, Lanarkshire. Hugh M. Mackie, C.A., 124, St. Vincent Street, Glasgow, has been elected Trustee. Examination of the bankrupt within the Sheriff Court House, County Buildings, Hamilton, Monday, July 29th, at 10.15 a.m. Creditors' meeting in the chambers of Mackie and Clark, C.A., 124, St. Vincent Street, Glasgow, on Friday, August 30th, at 12 noon.

READ, Roland Arthur, 9, The Pavement, Middle Lane, Crouch End, N.8, electrical engineer. Receiving order, July 16th. Debtor's petition. First meeting, July 29th, 11 a.m., and public examination, September 3rd, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

TEMPEST, Colonel, 4, Manns Court, Bradford, electrician. First meeting, July 26th, 11 a.m. Official Receiver's office, 12, Duke Street, Bradford. Public examination, September 17th, 10 a.m., County Court, Manor Row, Bradford.

Notices of Intended Dividends.

DAWSON, Joseph Edward, High Street, Boston, wireless engineer. Last day for receiving proofs, August 3rd. Trustee, C. G. Compton, 5, Church Close, Boston, Lincs.

MARSDEN, Charles Bertie, 60, Pisgah Street, Kenfig Hill, Glamorgan, electrical engineer. Last day for receiving proofs, August 3rd. Trustee, E. Owen, 34, Park Place, Cardiff, Official Receiver.

Order Made on Application for Discharge.

JOLIVARD, Kenneth Paul James, described in the Receiving Order as K. Jolivard and Co., 66, Victoria Street, London, S.W., electrical engineer. Discharge suspended for three weeks until July 12th.

Partnership Dissolved.

R. G. ACCUMULATOR COMPANY (Arnold Henry RILEY and Walter GLASCODINE), accumulator makers and repairers, 31, John Street, Bradford, by mutual consent, July 15th, 1929. Debts received and paid by A. H. Riley. W. Glascodine will continue the business.

Bankruptcy Proceedings.

EARLSDON RADIO SUPPLIES, LTD., 44, Albert Street, Newark-on-Trent. The first meeting of the creditors herein was held on July 20th at the Official Receiver's offices, 22, Regent Street, Park Row, Nottingham. According to the statement of affairs there were gross liabilities amounting to £1 252, against assets of £31, or a deficiency of £1 221. The company was registered on October 10th, 1928, with a capital of £500, divided into 500 shares of £1 each. Certain goods were obtained, and in December, 1928, a writ was issued against the company for £83 for goods supplied. A man who had been a solicitor was consulted and upon his advice the remaining goods were removed to the premises at Newark. All sums received from book debts and from the sale of further goods by the company were paid to him with the intention of effecting a voluntary liquidation. The company's books of account were also handed to him. Nothing further had been done towards effecting a voluntary liquidation. It was stated that £121 had been paid to the man and no account had been received from him. The affairs of the company remain in the hands of the Official Receiver.

HUNT, Sydney Everest, 8a, Torwood Street, Torquay, electrical engineer and contractor. At his public examination the Official Receiver stated that the debtor had committed himself to special charges for rent, rates, interest on loans and mortgages, and other charges, totalling from £9 to £10 per week. The gross charges on the business were about £30 a week, and there were wages and other business expenses to meet. Debtor: Yes, but my turnover was, say, £3 000 a year, and on ordinary normal working figures that would be £300 net profit. Debtor said he received his first serious debt summons in June, 1927, and they had been getting steadily worse, until, when he filed his petition, there were twenty against him. Until the beginning of May he did not realise he could not carry on. He had expected a Torquay Corporation electricity scheme, which had been in the air for a couple of years, to come into operation, and if this had happened he would have benefited to the extent of £5 a week. He was hoping also to get rid of the shop. Debtor admitted that certain accounts had been omitted from his statement of affairs, and would slightly increase his deficiency, which had been estimated at £1 813, there being more than 100 unsecured creditors. Law costs since May, 1928, amounted to £226. The examination was closed.

THE LEAD MARKET.

The lead market opened last week with a steady tone on Monday, but, according to James Forster and Co., later relapsed, July lead touching £22 10s. and forward £22 12s. 6d. Closing prices on July 19th were £22 13s. 9d. for July, £22 15s. for August, £22 16s. 3d. for September and October, or practically unchanged on the week.

The Newcastle-on-Tyne Electricity and Transport Committee has recommended approval of the provisions in the Central Electricity Board's scheme for the North-East area so far as they have reference to the Manors power station. The proposals include the conversion of the Manors power station into a transforming station supplied from a power station to be operated by the Newcastle-upon-Tyne Electric Supply Co. for the Central Board.

Whitwell P.C. is to oppose the application of Worksop U.D.C. for an Order to supply electricity in the parish. Mr. L. W. Walters, agent of the Shireoaks Colliery Co., has written to Whitwell Council stating that it has always been the intention of the company to supply electricity in the parish, and that negotiations are well in hand for the distribution of the current through a private company. The Council has decided to adopt the scheme if it materialises, and to call a parish meeting to discuss the question.

"Light's Golden Jubilee."

IT has been observed that once a misstatement of fact has been made, no correction can hope to overtake it. We rather fear that this must be the case in regard to the unintentionally misleading—but nevertheless misleading—statements which have been made by sections of the electrical industry in the United States of America as to the invention of the first electric incandescent lamp, which—as we have repeatedly shown on unassailable evidence, supported by the Institution of Electrical Engineers—was the work of that great British scientist, the late Sir JOSEPH SWAN. We have heard from America all sorts of explanations why the N.E.L.A. should persist in making a similar claim on behalf of Mr. EDISON, but in no case have these apologists even attempted to explain by what system of relativity they claim priority for an invention which, according to their own statements, was not produced until ten months after Swan had publicly demonstrated his lamp in England. We have already pointed out that the American celebrations, which reach their grand climax on October 21st, are intended to be world-wide, and evidence is already forthcoming of several decisions to co-operate in marking the occasion. At a recent meeting of the South African Institute of Electrical Engineers the President announced that South Africa had been asked to co-operate in the celebration of "the fiftieth anniversary of the invention of the incandescent lamp as we know it to-day," and we learnt this week from Japan that a joint meeting of the Japanese Institute of Electrical Engineers, the Illuminating Engineering Society, the Electrical Industrial Association, the Nippon Radio Broadcasting Society, and numerous other professional and scientific bodies "unanimously passed, with great enthusiasm," a decision to celebrate the occasion on October 21st throughout Japan, a sum of 300 000 yen being voted for the purpose. While regretting the necessity to refer again to this matter we would express the hope that our American friends will realise the injustice they are unwittingly doing to the memory of a great Englishman, and will arrange to make suitable acknowledgment of SWAN'S work during the remainder of the jubilee celebrations.

The Government and Public Utility Loans.

IT is early yet to express an opinion as to the help that electricity supply undertakings may derive from the Government's Development (Loan Guarantees and Grants) Bill, the text of which has recently been issued. As it stands at present, the Treasury is to be authorised to guarantee certain loans to be raised in connection with public utility undertakings and to authorise the giving of financial assistance in respect of expenditure incurred on loans raised for development purposes. At first glance this suggests a simple way out of the difficulties which many electricity suppliers are finding in financing the development of the less densely populated portions of their areas, but as the Bill does not include in its definition of a public utility undertaking one which is carried on by a local authority, the possibility of benefiting electrical development is considerably lessened. However, the local authorities are not entirely excluded from participation, for by a circuitous procedure the Minister of Labour, with the approval of the Treasury, and on the recommendation of a Committee appointed by him, may make grants to local authorities towards expenditure to be incurred for carrying out works of public utility calculated to promote employment in the United Kingdom. As local authorities are greatly in the majority in the total number of authorised electricity supply undertakings in this country the Bill's definition of a public utility undertaking should certainly be modified.

Monotony in Work.

BOREDOM as a result of doing work of a monotonous character is a phenomenon sufficiently widespread to exert a noticeable reduction in industrial output, and anything that is likely to make the work of operatives less boring will be welcomed by manufacturers. The conclusions of an inquiry conducted by the Industrial Fatigue Research Board, which has now been issued in the form of a report, are, therefore, worthy of study by manufacturers desirous of increasing the productivity of their workers. One of the most interesting points arising out of this study is that boredom is less likely to occur where the work

Digitized by Google

is either entirely automatic, or, at the other extreme, when attention is entirely concentrated on the task. Boredom is most marked in semi-automatic processes which require enough attention to prevent mind-wandering, but not enough for the complete absorption of mental activity. As the amount of boredom experienced appears to bear some relation to the conditions of work its occurrence can be checked by suitable changes in the form of activity, when the operatives are paid on output, when the work is conceived as a series of self-contained tasks, when the operatives are allowed to work in compact social groups, and when suitable rest periods are introduced. The report is interesting and suggests various helpful ways of dealing with a definite industrial problem, in spite of the final conclusion that " continued exposure to monotonous conditions of work causes adaptation to such conditions, so that work which initially is tedious and unpleasant may afterwards be tolerated or even mildly enjoyed."

The Railways and Electric Cooking.

THE main line railways of this country which have in the past been so blind to the possibilities of electricity, not only for traction purposes, but also for lighting and cooking, seem to be turning over a new leaf. In fact, the L.N.E.R., in advertising the " features of a famous train "—the Flying Scotsman—proudly mentions electric cooking as a special attraction. In the necessarily confined space available for cooking on trains electric cooking is a most attractive proposition, and it is remarkable that the cooking facilities on the Flying Scotsman have not been extended to many other trains. Naturally, the cost of conversion of existing restaurant cars will be advanced as an insuperable obstacle, and while there is still a considerable proportion of gas-lighted rolling stock in use it is perhaps unduly optimistic to look for such an ultra-modern convenience as electric cooking. Excuses for failure to use electricity for cooking at the terminal stations are, however, not so easily found, especially when it is remembered that in India the G.I.P. Railway gives its passengers the advantage of electric cooking in the restaurant at its Victoria terminal.

Corrosion and Water Flow.

AN interesting experiment on corrosion shown before members of the Institution of Civil Engineers demonstrated the action on steel of water at different velocities. A simple apparatus maintained a flow of water on to the centre of a circular steel plate of about 10 in. dia., which rested on a platform over a tank. The plate was placed horizontally, and over its centre was mounted a pipe with a stop valve and a $\frac{1}{2}$ in. dia. nozzle, which delivered a jet of water perpendicular to the plate, the nozzle being about 1 in. from the plate. The stream of water issuing from this nozzle completely covered the surface of the plate, and formed a circular wave of a diameter between 4 and 5 in. The flow of water over the plate's surface inside this wave was radial, and small bubbles could be seen moving radially from the jet centre to the wave. On the other side of the wave, that is, between the wave at the edge of the plate, the water was much deeper, and of a much slower velocity; also, the small oxygen bubbles were not swept radially to the edge, but remained stationary on the plate's surface. After a time it was seen that around these bubbles oxide was forming, and eventually the plate's surface outside the wave circle was found to be corroded, while inside the wave circle the surface was still quite bright. After the experiment had been in progress for some hours, the plate was removed and wiped; the portion which had been in contact with the water inside the wave was quite bright, while the portion which had been in contact with the water outside the wave was etched by the small oxygen bubbles. Another plate was shown which had been used in a similar experiment for a period of 170 hours. Half this plate had been brushed to remove the oxide from the surface, and there was a distinct line of demarcation between the smooth inner circumferential area and the corroded outside area. The object of the experiment was to demonstrate that water passing through the tubes of an economiser with a high velocity, and having " turbulent flow," will brush off any small bubbles of oxygen, which would otherwise adhere to the inside surface of the metal tubes and cause internal corrosion; while water passing through the tubes at a low velocity will not be able to brush off the bubbles, and therefore corrosion will take place. The point between the two velocities is the " critical velocity," and, in the case of this experiment, was indicated by the wave. A similar experiment was originally made to determine what velocity should be used through the tubes of the Foster economiser, in order to prevent internal corrosion.

Electric Signs Give Public Service.

THE E.L.M.A. Lighting Service Bureau has convincingly shown, by means of its miniature street model, how great a factor in the illumination of city streets is the shop window and other commercial lighting in such thoroughfares, and how, when this form of lighting is switched off, generally quite early in the evening, many apparently well-lighted thoroughfares take on the gloomiest aspect due to poor public illumination. A striking practical example of the public value of commercial window lighting and electric signs was recently afforded in New York, when, as a protest against an attempt to ban electric signs in a certain district, it was arranged that practically all the elaborate signs on Broadway should be extinguished for three minutes one evening. It was expected that many people would visit the area to see how dark the streets would be without electric signs. But the police, fearing that the demonstration would make the theatre district so dark as to disorganise the traffic, intervened, and, as they acknowledged that though the primary purpose of electric advertising signs is purely commercial, they perform an indispensable public service, the demonstration was abandoned. Over here the electric sign business is in its infancy, and though the industry is partly to blame for its slow progress, outside attempts to limit the use of such signs have been a formidable obstacle. Electric sign advertising, if only it is developed in the right way, represents a big potential revenue for the sign and lamp manufacturers, and a very useful load for the supply authorities. And if obstructive efforts are countered with demonstrations of the civic value of this form of advertising, development in the future should proceed on a much larger scale.

The Sulphur Problem.

ALTHOUGH we have on occasion criticised the promoters of the new Battersea power station for their apparent disregard of fears that were at the time quite justifiably expressed by the general public, and also by quite a number of electricity supply engineers, we do not feel justified in extending any support to the latest agitation which found vent at a Westminster City Council meeting in references by a dignitary of the Church to " this horrible inferno over at Battersea." Although Mr. FLADGATE's statement of the case which was issued some months ago definitely suggested that hope was held of finding a satisfactory means for overcoming the sulphur fume problem, the objectors to the project still had on their side a body of technical opinion which believed those hopes to be unfounded. Now, however, as a letter on our correspondence page shows, the company most emphatically asserts that a perfectly practicable and commercial solution of the sulphur problem has been evolved, and that the fears that have been expressed as to possible damage through sulphur fumes are consequently groundless. On such a categorical statement it would seem that the opposition would retire. As it has not done so, and is rather renewing its efforts, it can only be assumed that the real objection is not to any anticipated damage that might be caused to property and health by fume emission, but to the erection of a station of the completely innocuous type which Mr. FLADGATE has so definitely undertaken to provide.

THE K.V.A. CHARGE IN A.C. TWO-PART TARIFFS.

Is it Adequate or Not?—Difficulties with the Hopkinson Method—Allocating the Standing Charges on a System—Concessions for Large Consumers who Correct Power Factor.

By E. V. CLARK, B.Sc., M.Inst.C.E., A.M.I.E.E., M.I.E.Aust.

INTRODUCTORY.—Electrical undertakings whose load consists largely of a.c. motors have usually found it desirable to adopt some form of tariff which takes power factor into consideration; but it has not been found possible to devise any form of tariff that cannot readily be shown to have serious defects in certain circumstances. The late Prof. Kapp in his paper "The Improvement of Power Factor,"* gave examples of various tariffs to this end in force in Great Britain and elsewhere; and Prof. Miles Walker summarised the discussion on this topic as showing a fairly general opinion that a two-part tariff based on kVA maximum demand and kWh supplied, constitutes "not only a simple but also probably as fair a method as any other." The recent informal discussion before the I.E.E., opened by Mr. E. W. Dorey (ELECTRICIAN, December 21st, 1928), shows, however, that there is at present no unanimity among responsible engineers concerning the most appropriate manner in which discrimination between consumers of good and bad power factor should be made.

In his paper "Power Factor and Tariff,"† dealing mainly with the influence of power factor on running costs, the writer rashly stated that a tariff basing the standing charges upon the peak demand in kVA, though not strictly rational, was undoubtedly advisable. In the discussion, this view which received endorsement from at least one prominent engineer was declared by another to be distinctly inequitable.

Analysis of Standing Charges.

In this diversity of opinion, it has seemed desirable to analyse the standing charges entailed in supplying consumers of different power factors, with a view to determine the adequacy or otherwise of the kVA charge. Naturally, such an analysis must be made on the basis of a number of arbitrary assumptions, which do not hold in practice; but, so far as possible, these have been indicated in the letterpress, and liberal use made of footnotes to indicate briefly the general effect of any departure from the assumed conditions. To the writer's considerable surprise, he reached the conclusion that, subject to these limitations, the appropriate standing charges of any consumer can be expressed in terms of a small number of factors, which should be readily evaluated with some degree of approximation in any particular undertaking. Introducing numerical values for the factors involved enables a series of straight line graphs to be drawn, showing how the ideal standing charges, per kW of consumer's peak load vary with his power factor under different circumstances. Their consideration shows that in general a standing charge based on consumer's maximum demand in kVA, though purely an empirical rule having no logical basis, happens to come reasonably close to the ideal charge for ordinary induction motor loads on any system where the power factor of the system's peak load is poor, the distribution mains extensive, and the diversity factor high; but departs very widely from the ideal where these conditions do not hold.

In Part II of this article, the suitability of a tariff based directly on the ideal standing charges attributable to the consumer is discussed; and the conclusion is reached that the kVA charge, where reasonably appropriate to the conditions of supply, has important practical advantages over the alternative form of tariff.

SYMBOLS.—The following are the principal symbols used in this article:—

P = kilowatts in consumer's peak load
Q = Lagging wattless kVA in ditto.
S = Total kVA in ditto.
Po, Qo, and So = the corresponding elements of the station peak load.
φ = lagging phase angle of consumer's peak load.
θ = lagging phase angle of station peak load.
Dp = diversity factor of power loads = $\Sigma P/Po$.
Dq = diversity factor of wattless component = $\Sigma Q/Qo$.
£X = Annual (standing) revenue required by a d.c. undertaking, per kW of peak load on station, to cover the annual charges on the system.
£Y = Annual (standing) revenue required by an a.c. undertaking, per kW of peak load, to cover the annual charges on that part of the system whose cost may be regarded as depending on kW capacity.
£Z = Annual (standing) revenue required by this a.c. undertaking, per kVA of peak load, to cover annual charges on that part of the system whose cost may be regarded as depending on kVA capacity.

With the above symbols, the requisite annual revenue to be derived from consumers' standing charges must, therefore, total

£XPo on a d.c. system; and
£$YPo+ZSo$ on an a.c. system.

Part I.—Influence of Power Factor on Standing Charges.

ASSUMPTIONS INVOLVED IN A TWO-PART TARIFF.—A two-part tariff is normally based on the Hopkinson principle that the cost of any supply of electricity is divisible into two parts—the running costs, depending on the number of units supplied, and the standing charges, depending on the contribution that that particular consumer makes to the peak load on the system. In this article, the possibility of separating running costs and standing charges is assumed; and running costs are ignored, as outside its scope. Naturally, any weaknesses of this method of charging that arise on a d.c. system will also be apparent on one of a.c., in addition to the troubles caused by power factor. A brief survey of the limitations of the two-part tariff on a d.c. system should, therefore, help to clear the air.

With an industrial load, the standing charge in a d.c. system may be levied, either upon the sustained maximum demand as measured, or upon the rated capacity of the plant installed. Of these, the former is usually regarded as the more satisfactory; and hence with a.c., one may assume that the consumer's peak load should form the basis on which his standing charge is to be computed.* Practical considerations usually require that maximum demands be read monthly or quarterly, but the assumption of an annual reading simplifies matters. Again, a uniform charge per kW of peak load assumes that capital charges are proportional to load, and that distribution losses and charges are unaffected by the locality of the consumer. Some correction for such errors may be made by sliding scales depending on magnitude of load, or distance from power station. Similar types of correction may be adopted with an a.c. tariff if desired, so these matters may be ignored; though it may be pointed out that the small change of phase angle introduced by the distribution system introduces a slight additional error.

The Fundamental Cause.

The fundamental cause which prevents a Hopkinson type of tariff from being of universal application on a d.c. system is, of course, the matter of diversity factor. If all consumers' peak loads synchronised with one another, and therefore with that of the system, the case for such a tariff would be irresistible. But actually, owing to diversity of time of peak loads, it is impossible to frame a single Hopkinson type of tariff which shall levy an adequate but not excessive charge on every consumer, irrespective of the nature of his load; and hence such a tariff is usually accompanied by other tariffs for special classes of load. In postulating ideal conditions for the application of a two-part tariff one must therefore make the further assumptions that the whole of the consumers are of a single type, and either that their peak loads practically synchronise with one another and with that of the system, so that the diversity factor is unity, or else, that all consumers must be considered as contributing equally to the diversity factor, so that all should share proportionately in the financial benefit that diversity factor allows. This last assumption implies that if a consumer has a peak load of P on a system of diversity factor D, then the addition to the station peak that his load causes is P/D. Further, on a d.c. system, if the annual revenue per kW of the station peak requisite to

* J.I.E.E., Vol. 61, No. 314.
† J.I.E.E., Vol. 64, No. 354.

* The essence of the argument is the same, whether peak load as measured, or as estimated, form the basis of computation; but some difference arises in the definition of diversity factor.

Digitized by Google

cover standing charges with the desired margin of profit is £X, then on a system of unity diversity factor the appropriate rate for the standing charge to the consumer should be £X, but on a system of diversity factor D it is £X/D.*

Three Diversity Factors.

But on account of power factor, an a.c. system differs very materially from one of d.c., in that there are three diversity factors to be considered, namely, diversity factor of kW loads, of wattless kVA loads, and of total kVA loads. Thus, if a consumer has a peak load of P kW plus Q lagging wattless kVA, giving together a total load of S kVA, and if Po, Qo and So are the corresponding measures of the peak load on the station, the three diversity factors are—

$Dp = \Sigma P/Po$, the kW diversity factor.
$Dq = \Sigma Q/Qo$, the wattless kVA diversity factor.
$Ds = \Sigma S/So$, the total kVA diversity factor.

With an ordinary induction motor, throughout its working range, but exclusive of starting conditions, increase in kW load is accompanied by increase in wattless current; and hence its sustained peak loads in kW, in wattless kVA, and in total kVA occur simultaneously. It seems probable, therefore, that in the majority of cases a consumer's three peaks will occur together; though this is not necessarily so, and certainly will not be the case where some types of phase correcting apparatus are in use. The calculations below assume that the three peaks on the station occur together; and if they do not, it will usually suffice to consider the peak load in total kVA, and regard the power and wattless components of this as the other two peaks.

It is thus seen that the existence of a power factor introduces complexities quite unknown in d.c. systems. And, further, it should be pointed out that even though all consumers' peaks synchronise—the normal condition for unity diversity factor—yet owing to the vectorial addition of total kVA's the ratio $\Sigma S/So$ will be appreciably greater than unity, unless all consumers have approximately the same power factor.

A.C. System with Unity Diversity Factor.—To investigate the influence of power factor on the standing charges attributable to a particular consumer, one may consider, first, a system having consumers all of one type, save for differences in power factor; and with peak loads occurring simultaneously, so that the diversity factors Dp and Dq are unity, but not so Ds. The other assumptions involved are generally those indicated in the last section.

Let the peak load on the station have components Po kW, and Qo lagging wattless kVA, giving a total load of So kVA at a lagging phase angle θ. If a consumer has a peak load of components P kW and Q lagging wattless kVA, making a total of S kVA at a lagging phase angle φ, then the portions of the power and wattless components of the station peak that he contributes are P and Q respectively; but, owing to the laws of vector addition, his contribution to the kVA peak So is not S but $S \cos(\varphi - \theta)$.

The capital charges on the steam end of the power station depend on its capacity in kilowatts; but the capital charges on the electrical end of the station and on the entire distribution system must be regarded as depending on their capacity in kilovolt amperes. Hence the proper standing charge upon the consumer should be based partly on the kW addition he makes to the station peak, and partly on the kVA addition. If, therefore, the requisite annual return to the undertaking, with the desired margin of profit, is £Y per kW of peak load, to cover the standing charges on the steam end of the station, plus £Z per kVA of peak load to cover standing charges on the electrical part of the system, then evidently the portion of the total standing charges attributable to this individual consumer is £$YP + ZS \cos(\varphi - \theta)$.*

Since $P = S \cos\varphi$, and $Q = S \sin\varphi$, the above expression readily reduces to £$P(Y + Z\cos\theta) + QZ \sin\theta$, where P is the consumer's peak load in kW, Q the consumer's simultaneous peak load in wattless kVA (negative if leading), and Y, Z and θ are factors of the supply undertaking unaffected by the particular consumer.†

One thus reaches the conclusion that on a system of unity diversity factor the actual standing charges incurred in supplying a consumer of any power factor depend partly on his peak load in kW, and partly on the wattless component of that peak, but that no values of Y, Z and θ will make his actual standing charges proportional to his peak load in kVA. A tariff basing the standing charge on kVA peak can, therefore, only be justified on grounds other than those of expediency, if it can be shown that over a reasonable range of power factor it happens to approximate fairly closely to the actual costs incurred.

It is also seen that θ, the phase angle of the undertaking at time of peak load, has very marked influence on the surcharge that should be made for bad power factor. Should a system be such that the peak load power factor is exactly unity, so that $\sin\theta = 0$, then consumers' standing charges should be based on kW alone, independent of what their kVA peaks may be.‡

Allocating the Charges.

To allocate the standing charges upon a system to kW and kVA, one may say roughly that the electrical end of the power station—alternators and accessories, switchgear, and step up transformers if used—will cost from one-third to one-fifth as much as the steam end—turbines, condensers and pumps, boilers, piping, coal handling plant, etc. Cost of land and buildings may be allocated in the same proportion, as a first approximation. The cost of transmission lines and distribution system must be regarded as wholly dependent on kVA, and may roughly be taken as varying from 70% to 150% of the cost of the power station or stations. Taking power factor into consideration, and assuming that annual standing charges are proportional to capital expenditure, though this is not necessarily the case, the conclusion is reached that the ratio of Z to Y, that is the ratio of the annual charges per kVA on the electrical part of the system to those per kW on the mechanical part of the station, may vary between limits of 80 to 100 and 170 to 100, with 125 to 100 as a reasonable mean figure for a typical a.c. undertaking not giving or receiving any appreciable bulk supply.

It was deduced above that the standing charges attributable to any consumer amount to £ $Y + Z\cos\theta$ per kW of his peak

* In any ordinary undertaking a two-part tariff framed for an industrial load may have to conform to any position between two extremes. The first is that it must carry the whole of the standing charges due to its own peak load, other supplies being regarded as partial by-products; and the second is that this is regarded as the partial by-product, other services being debited with the charges on the whole of the peak that they would cause alone. In the former case, Po, the ideal peak load caused by the industrial load, is equal in magnitude to the peak that would be caused by this load alone. In the latter case it is the difference between the actual peak on the system and the imaginary peak whose charges are met by other supplies, and may readily be allowed for by an appropriate increase of the diversity factor D. In a.c. operation, however, it is in either case the effect of the industrial load on the actual peak load of the system that must be considered when studying the influence of power factor, and undue complexity should only arise in those cases where an undertaking has two distinct and nearly equal peaks, one in kVA of low power factor, and the other in kW of high.

* The apparent discrepancy that annual charges depend on plant installed rather than on the station's peak load is common to d.c. and a.c. alike, so need not be discussed here.

† A large consumer will affect θ to a small extent, and the contribution of a very large consumer to the kVA station peak is not quite $S\cos(\varphi - \theta)$, but errors caused by this are negligible. A more serious source of error arises from the fact that the phase angle on the station, θ_1 may differ appreciably from the phase angle θ_2, on the particular part of the distribution system concerned, as for example in the case of an undertaking supplying d.c. power through convertors in one area and a.c. industrial power in another. In such a case one may expand the above expression to

$$£P(Y + Z_1\cos\theta_1 + Z_2\cos\theta_2) + Q(Z_1\sin\theta_1 + Z_2\sin\theta_2)$$

where Z_1 represents the requisite standing charges per kVA on that part of the electrical system operating at a peak load phase angle of θ_1, and Z_2 the standing charges on that part operating at a peak load phase angle of θ_2.

‡ To push one's conclusions to extremes affords a good test of the soundness of one's arguments. This conclusion explains how it is that in the early days of the single phase induction motor its poor power factor was ignored without serious financial disability to the undertaking. At the present day this conclusion would be quite sound on an ideal undertaking where unity power factor was caused by the presence of a large number of consumers using ordinary induction motors, together with a large number using plant operating at leading p.f., due, for example, to the invention of a cheap and reliable motor which needed leading current for its use. But in any actual system where unity power factor in the station is brought about by the deliberate over-correction of a few large units, the conclusion is palpably unsound, both from the fact that the peak load power factor on the distribution system will not be unity (*vide* preceding footnote) and also because consumers who over-correct will only do so if given some rebate in tariff, which must be recouped from those who do not correct.

FIRST OUTDOOR SUB-STATION TELEPHOTOGRAPH.

ABOVE we are able to show, by courtesy of the Delta-Star Electric Co., Chicago, what is believed to be the first telephotographed picture of an outdoor sub-station. The photograph from which our reproduction is made has not been re-touched in any way. The sub-station, which furnishes supplies to the suburban area situated immediately west of Chicago, has both English and American equipment installed.

load, plus £ $Z\sin\theta$ per wattless kVA of that peak. The ratio of $Z\sin\theta$ to $Y+Z\cos\theta$, expressed as a decimal, is given in Table I for systems having peak load power factors of 0·9, 0·8, and 0·7, and having ratios of Z to Y of 80 to 100, 125 to 100, and 170 to 100.

Table I.—Systems with Unity Diversity Factor.

Ratio of charges, $Z\sin\theta$ per wattless kVA of consumer's peak load, and $Y+Z\cos\theta$ per kW of such load, for stations with peak-load power factors of 0·9, 0·8, and 0·7, and with ratios Z/Y of 80/100, 125/100, and 170/100.

Power Factor.	Ratio Z to Y.		
cos θ	80 : 100	125 : 100	170 : 190
0·9	0·203	0·256	0·294
0·8	0·293	0·375	0·433
0·7	0·366	0·477	0·555

Effect of Diversity Factor.—In a d.c. system, diversity factor introduces but little theoretical complication, so far as concerns consumers whose loads are such that it is impossible to attribute to any one special influence upon the diversity factor, since one merely assesses a consumer of peak load P as adding P/D to the station peak. But on an a.c. system, one may expect the power diversity factor to differ from the wattless component diversity factor; and both of these must be considered.

With the same notation as before, the peak load on the station is Po kW, plus Qo kVA of wattless component, giving a total load of So kVA, with a lagging phase angle θ. A consumer has corresponding peak loads of P, Q, and S, at a lagging phase angle φ. But if the power diversity factor is Dp, and the wattless component diversity factor is Dq, then this consumer must be regarded as having at time of station peak load a load of $P_1=P/Dp$ kilowatts, plus $Q_1=Q/Dq$ wattless kVA, making a total load of S_1 kVA at a lagging phase angle of φ_1 This consumer's contribution to the kW peak of the station is therefore $P_1=P/Dp$ kW, and his contribution to the total kVA peak is by vectorial addition $S_1\cos(\varphi_1-\theta)$. Thus the standing charges attributable to him are £ YP/Dp, to cover the annual charges on the steam end of the station, plus £ $ZS_1\cos(\varphi_1-\theta)$ to cover those of the electrical portion of the system; and as $S_1\cos\varphi_1=P_1=P/Dp$, and $S_1\sin\varphi_1=Q_1=Q/Dq$, it follows that the total charges attributable to the consumer, £ $YP/Dp+ZS_1\cos(\varphi_1-\theta)$, may be written £ $(Y+Z\cos\theta)\,P/Dp+Z\sin\theta\,Q/Dq$.*

Now if a given group of consumers have a kW diversity factor of 2, their combined peak may in an extreme case be due to half the consumers operating at full load, with the rest entirely shut down; and, in such a case, the wattless diversity factor will also be approximately 2. But in general one may expect the diversity factor to be due to the majority of these consumers operating at partial load. Provided that uncorrected induction motors are in general use, it follows that the combined power factor of this group will be appreciably lower than if all were working at full load. In other words, the ratio of wattless current to power current is greater than at full load, which means that the diversity factor of the wattless component is less than that of the power component.†

Consideration of the curve connecting power factor with input for an ordinary induction motor suggests that a system having a kW diversity factor equal to 2 would probably have a wattless component diversity factor of about 1·5, on the assumptions that industrial load alone is considered, and that most motors are of the plain induction type. Table II gives the ratio of $Z\sin\theta/Dq$ to $(Y+Z\cos\theta)/Dp$, expressed as a decimal, for systems similar to those in Table I, except that a kW diversity factor of 2, and a wattless component diversity factor of 1·5 are taken into account. Naturally, the figures are 33% greater than those in Table I throughout.

Table II.—Systems with kW Diversity Factor of 2, and Wattless kVA Diversity Factor of 1·5.

Ratio of charges, $Z\sin\theta/1{\cdot}5$ per wattless kVA of consumer's peak load, and $(Y+Z\cos\theta)/2$ per kW of such peak, for

* As it may happen that both peak load phase angles and diversity factors differ on various parts of the system, the above expression may be expanded to

$$£\,P(Y/Dp+\Sigma Z_1\cos\theta_1/Dp_1)+Q\Sigma Z_1\sin\theta_1/Dq_1$$

where Z_1 represents the requisite annual revenue per kVA of peak load, to cover standing charges on that particular section of the electrical system which has peak load phase angle θ_1 and diversity factors Dp_1 and Dq_1.

† Where phase corrected motors are considerably used, the reverse condition may hold; and if the use of static condensers to improve power factor were general, the diversity factor of the wattless component might be very high.

0·8	0·391	0·500	0·578
0·7	0·488	0·636	0·740

COMPARISON OF KVA CHARGE WITH COSTS INCURRED.—Having thus obtained some rational basis for computing the standing charges attributable to consumers in different circumstances, one may readily compare these with the standing charge levied upon the reading of a kVA maximum demand indicator; and this is done in Fig. 1, where the

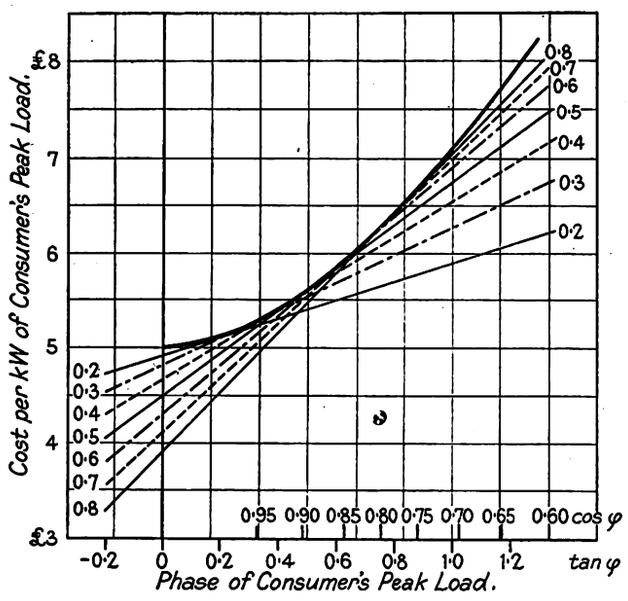

Fig. 1.

heavy curve represents the charge per kW of peak load levied on consumers of different power factors by a tariff of £5 per kVA of peak load, and the straight lines represent the standing charges attributable to them, with ratios of charge per wattless kVA to charge per kW running from 0·2 to 0·8. It will be noted that the figure is plotted to a scale of tan φ, in order that the "Costs Attributable" curves shall be straight lines; and that these have, in each instance, been drawn, at the required slope, tangential to the kVA curve, in order that the region over which they approximately coincide may be more manifest. Reference to Tables I and II will indicate the general conditions of a system to which each straight line corresponds.

Divergent Views Explained.

This figure explains very clearly why it is that the kVA charge is regarded as eminently suitable by the responsible heads of some undertakings, and utterly unsatisfactory by others. Take, for example, an undertaking whose relative capital costs of station and distribution, peak-load power factor, and diversity factor, are such that the ratio of standing charge for wattless component to that for power component is in the neighbourhood of 0·6, as may be brought about by a peak-load power factor of 0·75, a kW diversity factor of 2, and an extensive distribution system. The figure shows that in these circumstances the kVA charge accords quite reasonably with the cost line for all consumers whose peak-load power factors lie between limits of say 0·93 and 0·75; and this should cover practically every user of plain induction motors except those whose works are so badly laid out that their motors are habitually much underloaded. On the other hand, on a system having this ratio equal to about 0·3—such as may be caused by a high peak-load power factor, due to a tramway load supplied through rotary convertors—the range of coincidence lies between power factors of about 0·98 and 0·88; and all consumers having peak-load power factors much below the latter figure would be seriously overcharged on a kVA tariff.

The figure shows further that if a kVA tariff is adopted with the rate such that no consumer shall pay less than his proper share of the standing charges—that is, if the kVA charge is such that, when plotted, the theoretical cost line is tangential thereto—then whatever the nature of the system, consumers of exceptionally low power factor on the one hand, and those of very high or leading power factor on the other, are seriously overcharged; and at first sight this seems to be a serious defect of the kVA type tariff. But with a system having a ratio of 0·6 or higher, the defect is more apparent than real. If a consumer has a very low power factor, due to badly designed motors or a poorly laid out works, he can hardly complain that he is being ill used by the supply authority, as the remedy lies in his own hands. If on the other hand, his low-power factor is due to abnormal apparatus, taking wattless current rather than power, then he is certainly entitled to have such apparatus metered separately, and charged at a special tariff. Again, any consumer having a peak-load power factor higher than 0·9 is not a normal user of induction motors only. Either he has special apparatus installed, for which a special tariff is logical; or else he has deliberately put in considerable power factor correcting plant, and presumably has satisfied himself that this is profitable on the existing tariff. Nevertheless, it would appear that wherever a kVA type of tariff is adopted, special concessions should be made for those of the larger consumers who correct their power factors to unity or thereabouts, since in general, much less capital is required for a given amount of system phase improvement if a few consumers overcorrect than if a large number partially correct.

(*To be continued.*)

BOOK REVIEW.

Kabeltechnik. Die Theorie, Berechnung und Herstellung des Elektrischen Kabels. By DR. M. KLEIN. (Berlin: Julius Springer.) Pp. 486. 57 Reichsmarks.

Under this attractive title the author introduces the theory and practice of a special branch of cable-making with considerable skill and success. That the title is so much broader than the contents is a defect, but in view of the care bestowed upon definitions in the introductory chapter this is easily forgiven. The book is concerned almost entirely with lead-sheathed cables having paper dielectric. It immediately discriminates between high-tension power cables and telephone cables of air-space type. In the historical note with which the story begins, in the treatment of theory, and in the details and illustrations appertaining to design and manufacture, Dr. Klein has presented his subject with justice to all nations and to all contributors. The result is a work that will be widely appreciated.

General theory leading to the telegraph equation is neatly condensed in about 20 pages. Here the text will remind English readers of the style of Breisig, and Dr. Klein could scarcely have taken a better model. Then follows more extended treatment of power cable theory and design, with frequent references to British and American authorities, and welcome tables of numerical data and results. The same mode of explanation is adopted for the telephone cable, and to the whole is added a useful summary of methods of testing cables of both types. To complete his task, Dr. Klein has included some instructive chapters on modern methods of manufacture, transporting, erecting, laying, and protecting such cables. There is also an account of loading-coils and the general problem of loading. A special feature of the book is the array of sections of cables of most of the types described. By adopting concise treatment it has been possible to present the whole in 486 pages, with 474 illustrations.

SWITCHGEAR AND TRANSFORMER MANUFACTURE.

Developments at a Stafford Works—New Designs in Compound-filled Gear—The Mid-Point Auto-Transformer Scheme—Large Induction Regulators.

IT was interesting to note, on a recent tour of the Stafford Works of the English Electric Co., that switchgear manufacture was commenced at these works more than 25 years ago, though in those days switchgear was quite a minor accessory.

During recent years the switchgear department has been considerably extended, and the latest addition of a second large erecting bay of 18 000 sq. ft. brings the total of the area devoted to switchgear to over 100 000 sq. ft., this area being exclusive of the usual auxiliary shops, such as foundry, pattern shops, smithies, tool shops, main testing and despatch departments, which serve the whole works. In spite of the recent additions to the manufacturing plant we noticed that the switchgear shops were very busy.

Provision is made in the general layout of the switchgear works for economical routing of the processes. In the eastern block of buildings there are a number of bays, with the main stores running transversely across them at the northern end. On the extreme east is the machine shop with the special finish annexe at one end. In a small building outside the machine shop on the foundry side is installed the sand blasting equipment for removing scale, etc., from castings used in compound filled switchgear, and for giving a fine finish to special castings.

Parallel to the machine shops are the detail assembly and small assembly shops. To facilitate their work there is a calibration, flashing and general testing section attached to the shop, so that sub-assemblies and individual apparatus can be adjusted and checked before final assembly or transference to the adjacent finished goods store.

On the western side is a larger and higher block forming the large assembly shops, leading at its northern end into the main test bay and despatch department. These shops consist of two well-lighted bays 370 ft. long and 23 ft. 9 in. to the crane rail, and in addition to the erection of the larger classes of switchgear, a part of one bay is set aside as a sheet metal shop. The latter deals with the fabrication of angle and channel iron frameworks and sheet metalwork for kiosks, sheet steel cubicles, trucks, circuit breaker tanks, and the like, including the necessary electric welding and their own associated machining.

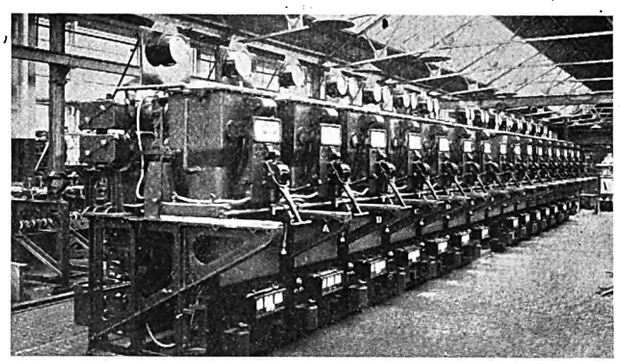
The four large assembly shops are served by five travelling cranes, and are devoted to the erection of large oil circuit breakers, steel structures, kiosks, metal-clad switchgear and similar large control gear. To facilitate the manufacture of the larger metal-clad pillars, use is made of plates let into the floor in suitable positions, to which can be bolted the pedestals of various pillars.

Compound Filling.

Special electrically heated ovens and boilers are installed at the end given over to the erection of compound-filled switchgear. The ovens are used for drying the castings before pouring, and for other miscellaneous work. The boilers, fitted with stirring blades to prevent local heating, are arranged for the direct filling of the compound-filled castings at the correct temperature.

Avoiding Leakage at Joints.

To avoid compound leakage at the joints, the compound-filled chambers are filled at the works, and despatched with cover plates bolted over their openings. On erection at site these plates are removed and small expansion chambers are fitted, which allow the compound to expand without being

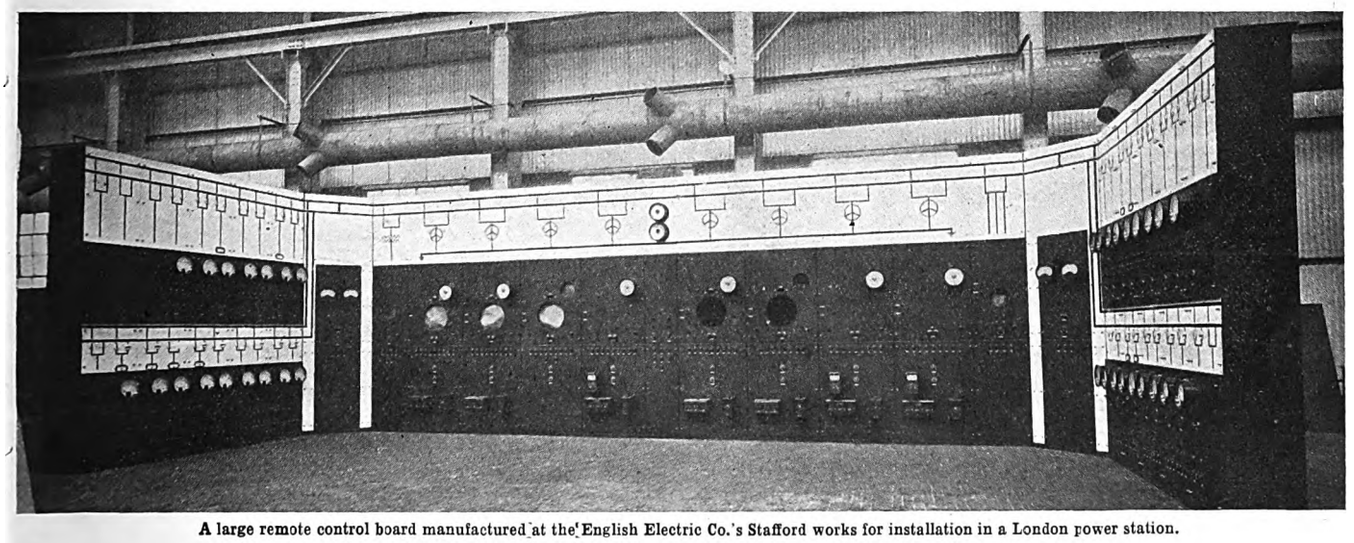


A 16-pillar compound-filled unit being dismantled for despatch from the Stafford works.

forced out between the joints. The compound can return to its place when the temperature falls, so that by this means it is ensured that air spaces and cavities cannot be formed inside the compound-filled chambers. Another important feature of the English Electric design is the provision of dust and moisture-tight shutters. When the pillar is withdrawn, the shutters, which are provided with a flexible steel lining edged with felt, are pressed on to the spout faces by an ingenious cam arrangement on the shutter mechanism. This prevents the accumulation of dust and moisture on the inside lower part of the spout face, which, incidentally, is the one part which cannot be cleaned without making the whole of the switchboard dead.

Special Finishes.

The special finish annexe, a busy and important auxiliary to the main processes, is equipped for plating with tin, copper, zinc, silver and nickel, for spray coating and for stove enamelling. Finish plays an important part in switchgear of all kinds, for while protection from corrosion, adaptability to cleanliness, and good appearance are valuable features, there are also certain problems arising from the Peltier effect which can be largely diminished or eliminated by suitably plating contact surfaces which, for one reason or another, are of different

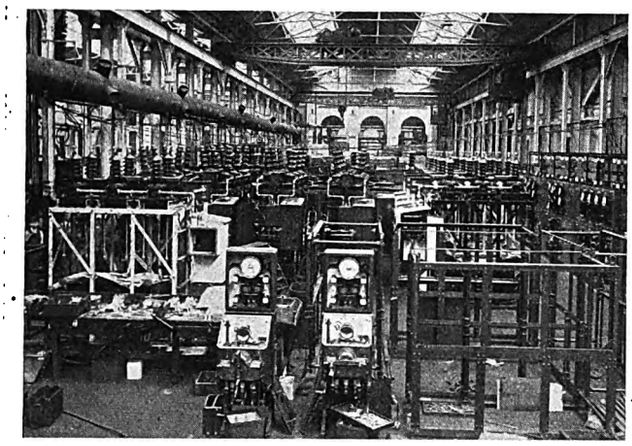


A large remote control board manufactured at the English Electric Co.'s Stafford works for installation in a London power station.

Digitized by Google

metals. Considerable use is now made of cellulose paint in various colours for spray coating the interior of relay casings, and other similar purposes.

The requisite voltages for flash tests for apparatus up to



Some 22 and 33 kV oil circuit breakers at Stafford. They are destined for use in various schemes at home and abroad.

66 kV working pressure are provided by means of portable testing sets. Facilities are also provided for carrying out motor and solenoid operation tests, mechanical tests and endurance tests in situ, so that it is not usually necessary to move finished apparatus into a special test area.

For the higher voltages and for testing outdoor apparatus under artificial rain, etc., a special portion of the erecting shop is set aside between the assembly shop and despatch departments. In this section tests can be carried out up to 500 000 V.

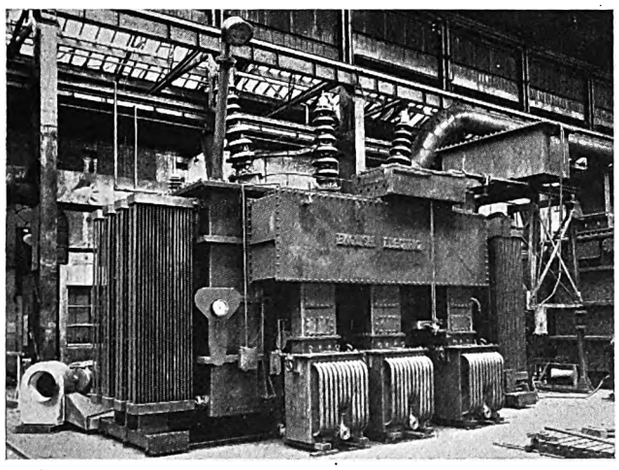
Testing of complete apparatus in conjunction with the plant which it has to control is carried out in the main test bay of the works.

The advantage of this method is obvious, as, for example, automatic sub-stations tested at the works with their own transformers, machines and switchgear can be despatched correct in every detail, without having to rely on site tests to any great extent.

On-load Tap-changing.

During the visit transformers totalling several hundred thousand kVA were seen in various processes of manufacture in the works. They include a number of 132 kV transformers for the Central Scotland Scheme. These are three-phase units with on-load tap-changing equipment on the 132 kV side.

The English Electric method of on-load tap-changing can be described as the mid-point auto-transformer scheme.



An English Electric 15 000 kVA, 132 kV, three-phase transformer, with on-load tap-changing equipment, for the Central Scotland Scheme.

Tappings are arranged on the main winding corresponding to half the number of voltages required, and intermediate voltages are procured from the mid-point of the auto-transformer. Connections are made in various combinations by means of external contactor mechanism and tap changing switches. There is only one regulating winding—there are no parallel circuits, and it is claimed that no part of the winding is subjected to overload during the tap-changing process. The company's view is that this scheme gives the simplest possible design of the main transformer, and the tap-changing equipment is entirely external to the maintank, thus facilitating easy inspection.

The Central Scotland transformers are arranged to give 75 % of their full load output by means of natural cooling, and for the higher loads an air blast is automatically brought into play on the radiating surface by means of a thermostat operating on the transformer temperature.

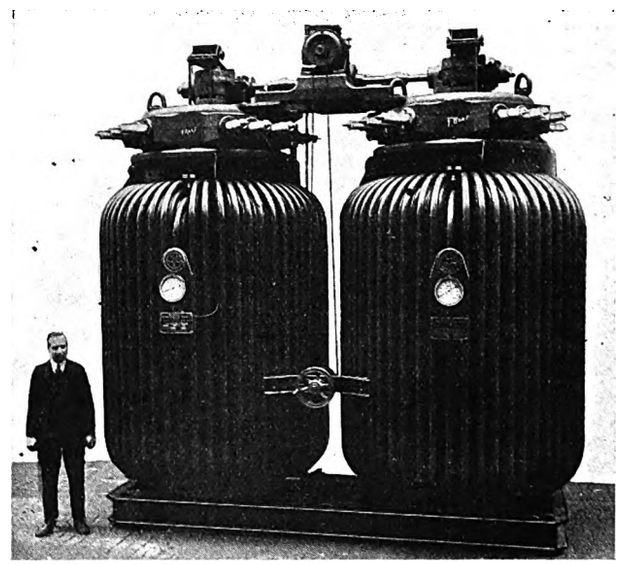
These transformers are despatched to site by rail in their own tanks and full of oil, so that no drying out on site is necessary and the minimum amount of work is required to put them into commission.

In addition to equipment for the Central Scotland scheme, the company is building a large number of 33 kV transformers for the Central Board's schemes in South-East England, Central England and North-West England. All are completely self-cooled, and all have on-load tap-changing equipment on the 33 kV side.

Induction Regulators.

During recent years the English Electric Co. has intensively developed induction regulators and at the time of our visit a large number were going through the works. There is one order of fifteen units for Australia, each unit being arranged automatically to control a 1 750 kVA, 6 600 V, three-phase feeder. Further orders are in hand for Australia, some of them for use on 3 600 kVA feeders.

The company has also built what it believes to be the largest twin unit induction regulator ever manufactured. These



A large twin unit induction regulator which gives plus and minus 10% regulation on 12 000 kVA 11 000 V three-phase feeders.

units, which are illustrated above, give plus and minus 10% regulation on 12 000 kVA, 11 000 V, three-phase feeders.

In addition to the larger units the English Electric Co. has developed a standard line of small induction regulators suitable for controlling low voltage distributors up to about 100 kVA capacity. These regulators are finding application in distribution networks where the increase in domestic requirements is causing poor regulation. It is claimed that not only does the use of the regulator cure the regulation trouble, but it increases the capacity of the distributor. The company has also developed a regulator for giving separate regulation on the three phases of an unbalanced three-phase, four-wire system.

Mr. J. H. Thomas (Minister of Employment), is considering a scheme, sponsored by Viscount Elibank, for the construction of an underground goods railway in London. It is claimed for the scheme that its construction would provide at least four years' work for 60 000 men, and the estimated cost is £40 000 000. The promoters ask for a Government guarantee of the interest on the capital outlay. The scheme includes a track of some 75 miles to link up the wharves with the various railway stations and big stores in the West End. Wherever possible the depots or stations will be on street level, but elsewhere they will be underground, and lifts will carry the trucks to the surface.

MARINE ELECTRICITY

Over £13 000 000 is Now Being Spent on Groups of Electric Ships—Operating Schedule of a Large Electric Liner—The Central Power Station Goes to Sea—Marine Electricity —The New Era.

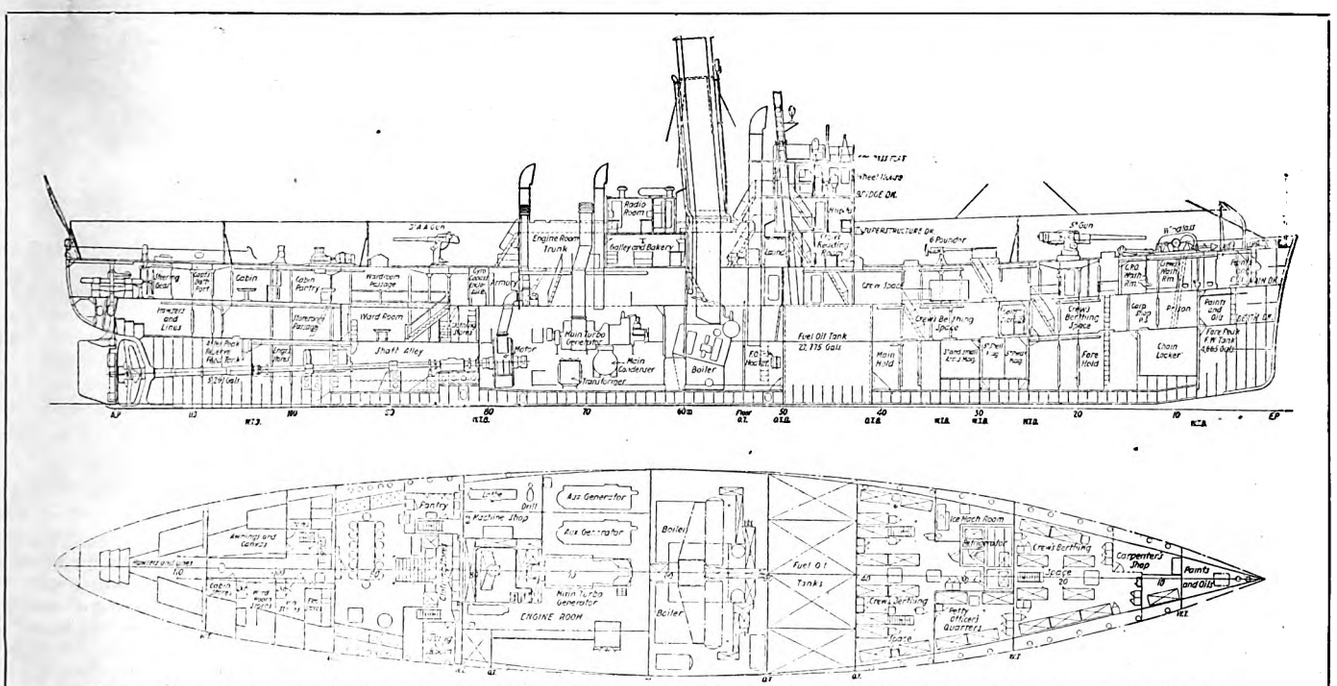
By A. C. HARDY, B.Sc., A.M.I.M.E. (Author of "Merchant Ship Types," etc.).

MARINE electricity continues very gratifyingly on the up-grade, both qualitatively and quantitatively. An important order has recently come to this country to a Belfast shipyard—for the entire remodelling and modernising of an existing electric ship, and for the conversion of the machinery from Diesel-electric drive into turbo-electric drive. In America, during July, the launch took place of the big turbo-electric liner "Pennsylvania," which is the third unit of the £4 200 000 building programme of the International Mercantile Marine Company. There are still rumours, which, unfortunately, as yet cannot be officially substantiated, that a British shipping company is to place a contract for a large electric liner.

Orders have been placed for several small electric ships of interesting type and trials have recently taken place of a new all-electric U.S. Coastguard cutter which is decidedly worth more than passing interest. As far as "auxiliary" electricity is concerned, a retrospective review of the situation reveals that shipowners are drawing upon the products of electrical firms to an ever-increasing extent. The applications of electricity in the "auxiliary" sense are widening and, together with this, electrical gear more and more is being adapted to, and built for, marine purposes only.

A great deal of capital, too, is now being locked up in electric ship propulsion. The Dollar Line, for example, is making a total expenditure of something like £9 000 000 on the construction of its six big passenger-cargo vessels for round-the-world trade. In addition to this, there is the £4 200 000 programme mentioned above. The "Pennsylvania" is to take her maiden sailing from New York for the Pacific coast on October 10th. The new vessel will be 613 ft. in length, with an 80 ft. beam, and a total displacement of 34 000 tons. Her total depth from keel to upper deck is 100 ft., and she will have a total possible S.H.P. on twin screws of about 17 500 H.P. This is just over twice the proposed power of a new electric passenger and cargo ship, which is to be built for particularly arduous service in Alaskan waters operating out of ports in Puget Sound, where fogs are very prevalent, navigation extremely difficult, and first class repair bases not always to hand. It is announced that some £600 000 will be spent on this ship, this totalling, even in the examples mentioned above, an expenditure in electric shipping of something like £13 800 000. Truly, with figures like this before us, we are justified in holding out electric ship propulsion as creating yet another era in modern sea transportation. And remember that this is a figure which includes certain propulsion orders and takes no account of the substantial contracts which are coming to the firms which make standardised electric motors for auxiliary purposes. What such a contract means for a batch of ships we shall see later. Neither does this total take into account, because it is confined to mercantile vessels, an expenditure made by the U.S. Government upon five fine turbo-electric coastguard cutters of 3 000 S.H.P., 17 knots speed, and of 2 075 tons displacement on a 15 ft. draft. The total cost per ship worked out at £180 000, of which individual total the machinery cost accounted for about £35 800.

It is, perhaps, indicative of the confidence with which the U.S. Government regards electric propulsion, that an electric ship should have been chosen to operate in Far Northern waters, occasionally within the Arctic Circle. This ship, the Diesel-electric ship "Northland," to which reference has often been made in these notes, has completed a long term of service with every satisfaction. But it is, perhaps, even more indicative of the confidence with which the private shipowner regards his electric ship when an examination is made, from a detailed point of view, of the work which Great Britain's first big electric liner, the "Viceroy of India" is now doing. The ship is, as was indicated in the last article, spending the summer cruising in the Mediterranean, and covering a total of about 21 000 miles. The series of cruises numbers five, and, for the whole of these, the first one of which started at Tilbury on May 31st and the last one of which terminates at Tilbury on August 23rd, only 108 hours are spent in a home port. The shortest period is 28 hours and the longest 30 hours, the average being 29 hours. Southampton is the port from which the cruises are starting, and the longest period in this port—30 hours—is actually four hours short of the longest stop in a cruise port—in this case 34 hours in Naples on August 3rd during the fifth cruise. After returning to Tilbury the "Viceroy of India" resumes her normal schedule in the London-Bombay mail with a sailing on August 30th—only one week after completing her cruise work. But when we consider that the average 29



The compactness of turbo-generators is well shown in this "central power station" for sea-going work—the 3 000 h.p. U.S. coastguard cutter "Chelan."

Digitized by Google

hours' home port spell has to allow time for repairs (if any), refuelling, revictualling, landing one set of passengers and embarking another set, and that of these 29 valuable hours a certain proportion necessarily is at night, then surely we are right in suggesting that, even an oil tanker, with her quick turn arounds, will not work as hard as will the "Viceroy of India" this summer. Her owners could not have chosen a better or more drastic method of "shaking down" the machinery.

A tremendous amount of manœuvring will be necessary, and here, of course, electric propulsion will be advantageous. The ship on her first cruise called at seven way ports, and the longest leg of the voyage is between Philippeville and Tangier—some 630 miles. The average time spent in port was just over 8½ hours.

A Glance at Recent Electric Propulsion Practice.

Ship Type	*Power at Shaft*	*Type of Propulsion*	*Elect. Output*	*Dimensions.*
Ferry	750 H.P.	Diesel-generators (2)	620 kW	178×43·5×14·7
Salvage ship	160 H.P.	Diesel-generators (2)	320 H.P.	119·5×32×—
Survey ship	640 H.P.	Diesel-generators (2)	520 H.P.	167·5×31·5×18
Coastguard Cutter	3 000 H.P.	Turbo-generator (1)	2 500 kW.	236×42×26·9
Passenger Ship	8 000 H.P.	Turbo-generators (—)	—	—×60×—
Passenger Liner	17 000 H.P.	Turbo-generators (2)	18 000 kW	612×78×82
Passenger Liner	26 500 H.P.	Turbo-generators	—	653×81×42·5

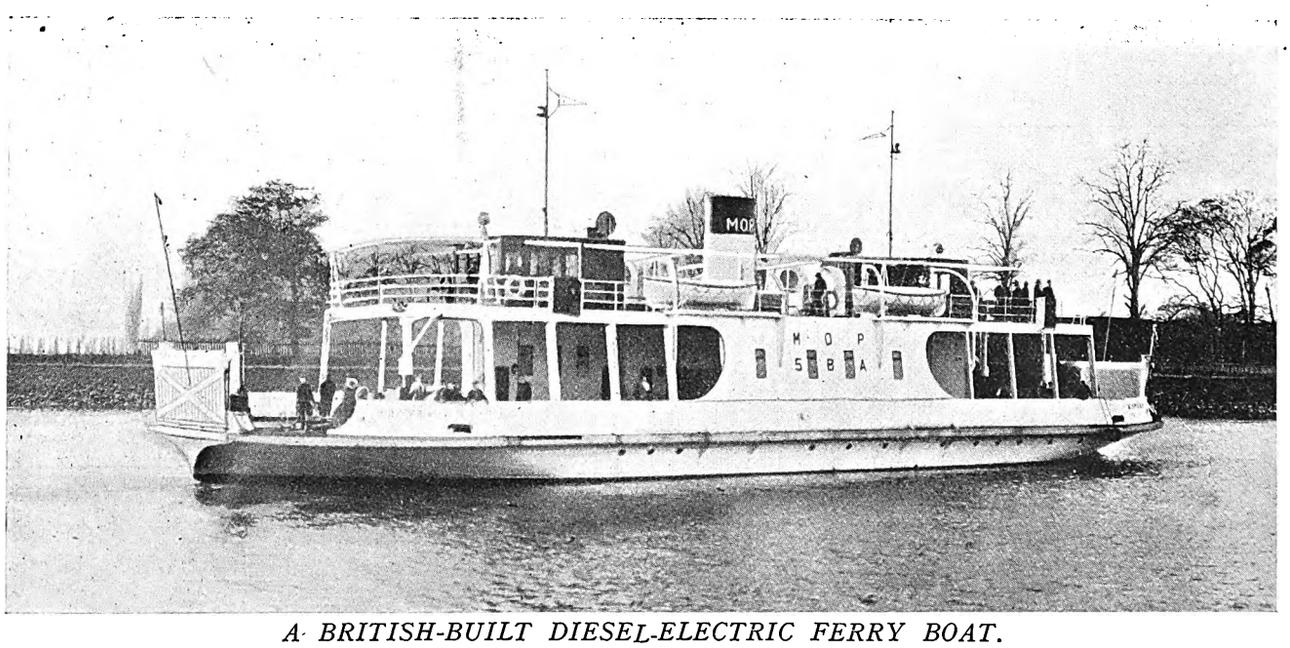
Returning now to the production side of marine electricity, those of us who are interested in marketing electric motors for driving pumps, winches, etc., may like to note that one order for a batch of three electric ships has produced recently for one firm no less than 10 149 H.P. in motors. Let us see what this amounts to in terms of auxiliary motors in the engine room and on deck. As far as the former are concerned, there are 16 motors per ship, with a total of 108 H.P. For the latter, there are three per ship, with a total of 75 H.P. Multiply these totals by three and add three propelling motors, each of 3 200 H.P., and we get the above-mentioned total of some 10 149 H.P. This, in itself, is no mean contract. The ships themselves are 232 ft. 6 in. by 34 ft. 6 in. by 14 ft. 6 in. in draft, and are the U.S. coastguard cutters to which attention has been called above, and they have a speed of about 16 knots with just over 3 000 S.H.P. They have recently been ordered to be constructed, and are practically repeats of the five ships of "Chelan" class, an inboard profile and hold plan of which is printed on page 137, and well repays study.

These little ships have been described with some truth as "central power stations sent to sea." An intelligent interpretation of this idea, on the part of the Westinghouse Company, has provided an extremely compact machinery layout for marine purposes. The ships are important, academically, on this account, and practically because they represent a successful electrification of a small fast ship which may not be without its effect upon British cross-channel ships.

Furthermore, for the first time practically on a turbo-electric ship, it has been possible to build the main turbo-generator to meet all power requirements, and most of the auxiliaries, including windlass and the principal deck auxiliaries and engine-room auxiliaries, take power from the main generating set through a transformer. At lower speeds than two-thirds of full power, however, this is not possible, and auxiliaries take their power from one of two auxiliary 3-unit generators on the port side of the power room, comprising a turbine, an a.c. generator and a d.c. generator. At certain speeds of the ship the a.c. generator is synchronised with the main generator set, the turbine cuts out and the auxiliary set, then becomes a motor. At the same time the auxiliary motors driving pumps, etc., take current from the main generator. As speed drops, the steam auxiliary turbine again picks up, and the whole procedure is reversed and the auxiliaries again feed off the auxiliary set. This arrangement is particularly worth noting in view of the possibility of its application to larger merchant ships. It is noteworthy that the superintendent engineer's report on the maiden voyage of a recent large electric liner contained a very definite complaint as to the noise of the auxiliary generators. This is one of the advantages of Diesel electric propulsion over turbo-electric propulsion—the main generator sets are also the auxiliary sets.

Layout of Plant.

On the "Chelan" class of electric ship the main generator unit comprises a turbine directly driving an a.c. generator set and supplying a 3 000 H.P. synchronous motor, developing its power at 163·5 r.p.m. The main turbine has an output of 2 500 kW at 2 300 V and 3 600 r.p.m. Steam for the main turbo-generator is supplied by two water-tube boilers, of Babcock and Wilcox type, burning oil. These operate at 250 lb. per sq. in. pressure and 250 deg. superheat, and represent the latest high pressure boiler practice. Fuel for these boilers



A BRITISH-BUILT DIESEL-ELECTRIC FERRY BOAT.

A RECENT addition to the steadily increasing number of electrically-propelled vessels is a shallow draught ferry boat built by Yarrow, Ltd., to the order of the Argentine Government for service on the River Parana. The electrical propulsion equipment and auxiliary electrical machinery and fittings were made by the Metropolitan-Vickers Electrical Co. The vessel is 145 ft. long and 40 ft. wide, and has a displacement of 340 tons. Propulsion is by twin screws at each end of the vessel, each of the four screws being direct driven by a separate motor rated at 200 H.P., 250 V, 350 r.p.m. Power is obtained from two main generating sets each consisting of a six-cylinder 350 r.p.m. M.A.N. Diesel engine direct-coupled to a 170 kW d.c. propulsion generator and to a 35 kW d.c. auxiliary generator. Manœuvring control is possible from each of three alternative stations—one in each of two pilot houses, situated at opposite ends of the bridge deck, and one in the engine room. Each pilot house controller controls one pair of motors driving the propellers at the opposite end of the vessel, and only one of the pilot house controllers can be used at a time. In the engine room there is only one controller, which is arranged to control whichever pair of motors is in operation or selected for operation, by the deck control gear.

Digitized by Google

is supplied from four cross bunker tanks arranged as one compartment forward of the boiler room. These have a 90 000 gal. capacity which gives the ships an 8 000 mile cruising radius at about 14 knots. The boiler room is separated from the power room by a watertight bulkhead, inter-connection being by means of an air lock. Control of the main propelling motor is arranged on the upper platform in the main power room on the starboard side. There is no control in the pilot house. This would apparently indicate that although there are certain very definite advantages in pilot house control, a very sharp cleavage of opinion seems to exist in the matter. It is worth putting on record, for what it is worth, that Diesel-electric ships apparently use pilot house control more than turbo-electric ships. Its employment on small craft of the tug and ferry type which are electrically propelled seems very obvious.

Actually these cutters are large ocean-going tugs and salvage vessels, for part of their duties consists in proceeding to the assistance of vessels in distress. We may here note that it was an electric coastguard cutter which towed the disabled British motorship "Silvermaple" from mid-Atlantic to Bermuda, picking her up when she was rolling almost helpless with a broken rudder head. For purposes such as this the hulls are designed to be very sturdy and of flush decked type. All superstructure is amidships. But the most interesting part of the whole ship is the power room. And here we begin to see the development of an entirely new marine engineering technique—a technique which will probably do much to revive the flagging fortunes of steam propulsion as it existed in the days before the marine Diesel engine became such an important factor in propulsion.

For consider that the electric ships, big and small, which we are discussing month by month in these notes do not represent the final word by any means, and that even lower costs per unit for propulsion may be attained. As far as power room layout is concerned, improvement will be along the lines of increased compactness, although a great deal has been accomplished in this direction already. The early electric ships were "spread-out" affairs with the propelling motor usually segregated to a special compartment in the extreme aft end of the ship. To-day that is all changed. Specially ventilated motors are in the power room itself under the eye of the man on watch. The turbo-generator is neatly arranged above the condenser and transformer, and occupies, in relation to power developed, almost infinitesimal space. The electric power room is becoming a "double-deck" arrangement with generators, control panel, and switchboard on the top level, and all the many auxiliaries which a steam prime mover inevitably requires on tank top level. The boiler plant is really the most space-eating part of the power plant, but, even here, improvement in boiler design in the way of high pressures and high superheat is reducing this to a minimum.

A Significant Change.

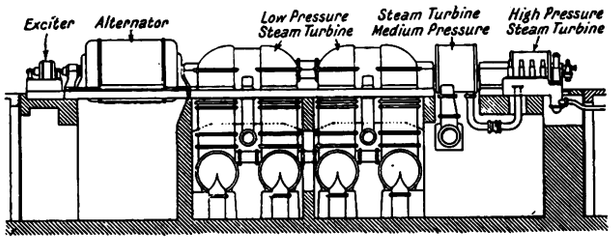
Notice also how the development of marine electricity has brought about a juxtaposition in the whole ship-constructing industry. Whereas formerly the electrical firm was a mere sub-contractor to the engine-building firm, in the case of the electric ship the electric firm takes the whole of the machinery work in its own hands, sub-letting such portions as pumps, and, in some cases, boiler, to the marine engineering firms. All this, however, requires a very special knowledge of marine conditions, so that when we visualise "marine" electricity as a special and specialised industry we see that this is indeed no exaggeration. It is an industry which deserves the closest of study in this country because, perhaps, in conjunction with some form of pulverised fuel, it may be of assistance to our bunker coal trade. Once we establish in our minds the idea that in electric propulsion the success or failure of the scheme depends upon the final cost per unit of power delivered to the propeller, and that on a tried, existing ship this has been established at 0·346d. per unit, we shall see that the type of fuel assumes slightly less importance. We are all searching round for an opportunity, for a channel, for a formula to apply to our coal industry. The electric ship for a certain limited field may provide all three. Let us examine it for fast cross channel ships, basing our designs upon the U.S. coastguard cutters. Let us consider it for new Liverpool ferries, and thereby eliminate much inefficient manœuvring which at present is in existence. Let us contemplate it for large tugs, although here Diesel-electricity has so much to offer that it is questionable whether turbo-electricity can compete—particularly with coal firing. Whatever be the future for electric ship propulsion, much will depend upon the drive and energy of the electrical industries, who, after all, must market their products to the shipowner.

STEAM TURBINE DESIGN.

Interesting High Pressure Unit for Paris Undertaking.

A 75 000 H.P. high-pressure steam turbine which the Société d'Electricité de Paris has ordered from the Oerlikon Co. for the extension of the St. Denis power station, marks an important advance in steam turbine design, as it is believed to be the first time that such high power has been generated in a multi-cylinder steam turbine set arranged with continuous shaft, and running throughout at a single speed of 3 000 r.p.m.

Under normal working conditions, the steam pressure



The Oerlikon turbine for the St. Denis power station.

measured immediately in front of the turbine amounts to 710 to 850 lb. per sq. in. (abs.) while the steam temperature is 842 deg. to 900 deg. F. In exceptional cases, the steam turbine must be capable of withstanding a pressure of 995 lb. per sq. in. and a temperature of 932 deg. F. The new turbine is thus built for steam pressures which have rarely been used up to now in conjunction with such high temperatures.

The installation is provided with plant for distilling, de-aerating and pre-heating feed water.

The steam turbine is coupled direct to a three-phase generator running at 3 000 r.p.m., and developing a continuous output of 50 000 kW at 0·7 power factor and a pressure of 10 500 V.

ELECTRICAL DEVELOPMENT PROSPECTS.

MR. R. P. Sloan, chairman and managing director of the Newcastle-upon-Tyne Electric Supply Co., Ltd., stated, in the course of an address to the Scottish Institute and North-East Coast Institution of Engineers and Shipbuilders at Newcastle recently, that no really substantial reduction in the price of electricity was likely to take place for a considerable time to come. With a recovery in trade the raising of capital should not offer any real difficulty to railway electrification, particularly as the establishment of the national grid should considerably reduce the amount of capital to be found by the railway companies both on mains and generating stations. To-day few factories of any size were without electric power in that district. Until recently, electricity had been commonly regarded as an extravagant heating agent. In practice, efficiency alone swung the balance of cost in favour of electricity and again items such as reduced labour costs, low maintenance charges, less rejects and spoilt work, cleanliness and ease of control were qualities of great value, and had greatly extended the field for electric heating.

AUSTRALASIAN ELECTRICAL DIRECTORY.

The eighth edition of "Tait's Electrical Directory of Australia and New Zealand" contains particulars of all electricity supply undertakings in Australia and New Zealand. These are arranged in alphabetical order, and the information given includes name of supply authority, type and capacity of plant, voltage and system of supply, mileage of distribution cables, number of consumers, population, prices charged, statistics of output, maximum demand, costs, etc., and name of engineer. In addition, particulars are given of all electric tramway undertakings. In the case of some cities having more than one authority or system of supply, maps are included showing the boundaries of the areas. There are also maps of the various States showing the electrically-supplied cities and towns and the principal transmission systems. Tables show the electric power installed in collieries in New South Wales, the number and generating capacity of electricity supply undertakings, the number of consumers and the population in the various States, the respective numbers and total capacity of steam, oil, gas, and water-power stations, the horse power of electrical and other power plant in factories, and mileages and other statistics of tramways. The price of the book is 7s. 6d., plus postage.

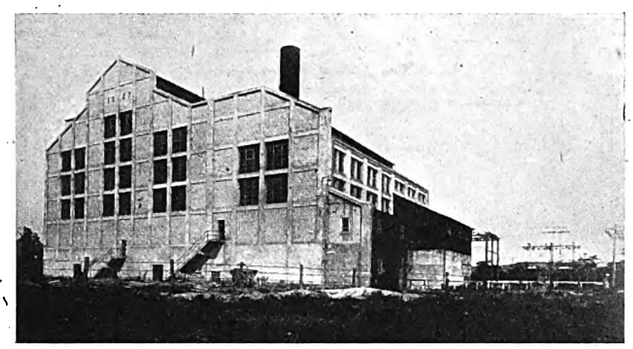
COCKLE CREEK.

New Central Power Station in Connection with Colliery Plant.

CONCENTRATION of electricity supply in larger stations is a policy which is finding application in many countries, and a notable recent example is to be found in the power station erected by Caledonian Collieries, Ltd., of Newcastle, New South Wales. This station, views of which are reproduced on this page, is designed to supply the requirements of all their own collieries and also a number of outside consumers. The new station thus takes the place of a number of medium-sized plants, each situated at the individual collieries of the group.



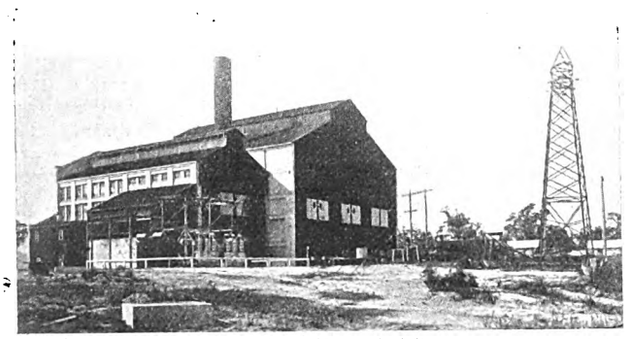
Exterior view of the Cockle Creek (N.S.W.) power station.

Already it has been found that the installation of the central plant has reduced generating costs considerably. As continuity of supply is an important consideration, the whole plant has been arranged in duplicate. The transmission line has to cross tracts of country where bush fires are frequent, so the whole of the transmission line has been erected on steel towers. In order further to safeguard the plant against involuntary shut downs due to line failure, insulators which are in excess of the rating usual for the voltage have been used, and results since starting up of the plant have fully justified this additional expense.

The power station is situated between the Barnsley and Cockle Creek stations on the Newcastle to Sydney, N.S.W. Government Railway, adjacent to Cockle Creek, from which salt water for condensing purposes is pumped. The building is of reinforced concrete, with brick panelling, ample provision being made for extensions as required.

Plant Installed.

The plant at present installed includes two 5 000 kW turbo-alternators generating three-phase 50 cycle current at 6 600 V. Steam is supplied by two Babcock and Wilcox C.T.M. boilers, each with a heating surface of 8 619 sq. ft., fitted with superheaters having a surface of 2 240 sq. ft., and Green's Tri-Tube economisors, 4 874 sq. ft. The condensing water gravitates from Cockle Creek through the necessary screens to circulating pumps, thence through the condensers, and is discharged by gravity race into an adjacent swamp.



Another view of the station showing outdoor sub-station and type of transmission line tower construction employed.

The boiler plant has been arranged for economical firing with low-grade fuel, and as large quantities of unsaleable pit waste are available adjacent to the power station, the generating costs are low. Furthermore, in the event of industrial trouble, continuity of operation is thus assured.

The current is stepped-up at the station from a generating pressure of 6 600 V to 33 000 V at an outdoor sub-station, arranged in duplicate, and the energy is then transmitted to sub-stations at the various collieries. The overall length of the main transmission line is twenty miles. A secondary transmission line operating at 6 600 V feeds two of the company's collieries and outside consumers in the same district, near the power station.

An unfailing supply of fresh water of a quality suitable for boiler feed without treatment is available. The conditions as to fuel supply, condensing water, fresh water, etc., indicate that this undertaking is one which should grow. That the station has been in operation continuously for the past two years indicates that the supply is reliable.

Power Margin for Sale.

At present there is ample margin of power for sale to outside consumers, particularly as there is a wide area of land in the vicinity eminently suitable for new industrial sites in the rapidly progressing industrial centre, where are already situated the iron and steel smelting works and rolling mills of the Broken Hill Proprietory Co., Ltd., the wire netting works of Lysaght Bros. and Co., Ltd., the wire and nail works of Rylands Bros. (Australia), Ltd., the Railway Wheel and Axle Works of Vickers-Commonwealth Steel Products, Ltd., the Australian Wire Ropes, Ltd., Sulphide Corporation, Ltd., cement works, etc.

The design and construction of the whole of the power station and transmission system was under the supervision of Mr. J. E. Donoghue, consulting engineer.

CANADIAN POWER PROJECTS.

Proposed Developments in British Columbia and Ontario.

THE West Kootenay Power and Light Co., Ltd., has made application to the British Columbia Water Board for a licence permitting them to establish a power plant at the mouth of the Adams River, at the level of the Shuswap Lake. The new power plant would be linked up with the company's main transmission lines from Bonnington Falls via Kelowna, and the power generated would be utilised largely by mines in the Princeton district, including that of the Granby Consolidated Mining and Smelting Co., at Copper Mountain. The new plant would develop some 25 000 or 30 000 H.P., which would assist the company in supplying the rapidly increasing demands on its parent company. In the meantime, the British Columbia Government has been assured that the company has decided definitely to proceed with the harnessing of Pend Oreille River, near the International boundary, south of Nelson, which will be one of the largest hydro-electric power developments yet undertaken in the Province.

The West Kootenay Power and Light Co., Ltd., also contemplates the erection of a dam at Granite, the construction of which is expected to add greatly to the output of its big power plant at Bonnington Falls. Granite is situated at the outlet of the Kootenay River from the lake, and the output of the Bonnington Falls plant has hitherto been reduced to one-half of the maximum of 150 000 H.P. through the lack of a sufficient head of water, when Kootenay Lake is low.

The Ontario Government has approved of the purchase by the Ontario Hydro-Electric Power Commission of the Claybank, Stewartville, Burnstown and High Falls power sites in the Upper Ottawa Valley. These sites are now in the possession of the M. J. O'Brien Co., Ltd., and the purchase price is stated to be $1 800 000. The acquisition of these sites adds approximately 100 000 H.P. to the available water power resources of the Commission.

ELECTRIC BATTERIES IN CANADA.

According to the Dominion Bureau of Statistics at Ottawa, the production of electric batteries in Canada during 1928 amounted in value to $8 189 573, as compared with an output worth $7 722 011 in 1927 and $7 766 798 in 1926. Storage batteries were made in 17 different establishments, and the total production was valued at $4 590 984. The output included 61 357 batteries worth $398 121 for radio filament lighting and plate supply, 467 886 batteries valued at $3 283 913 for the starting and ignition of internal combustion engines, 60 085 units (cells or jars) worth $414 842 for farm lighting, and $494 108 worth for all other purposes. Dry cell batteries for radio purposes, flashlights, etc., made in four plants, numbered 33 585 301 individual cells valued at $3 437 410. Battery parts and supplies were worth $161 179. Imports of batteries into Canada during 1928 totalled $701 289 in value and included 33 278 storage batteries valued at $598 754 and primary electric batteries valued at $102 535. Exports are not shown separately in the trade classification.

RECENT ELECTRICAL PROGRESS IN INDIA.*

Developments in the Indian States—Outstanding Hydro-Electric Projects—Supply on a Kilowatt-year Basis—Transmission and Distribution Problems.

By A. T. COOPER, M.Inst. C.E., M.I.Mech.E., M.I.E.E., M.Conr.E.

(*Continued from page* 46).

ONE-THIRD of the total area of India, containing a fifth of its population, is ruled over by hundreds of Indian princes having their own internal governments. Many of these rulers have been quick to recognise the advantages of the use of electrical energy, and possess up-to-date installations for its generation and distribution. A few recent developments may be briefly described :—

Hyderabad.—The Nizam's Government early recognised the value of electricity supply in the capital city, and dealt with its initial lighting requirements by means of a small steam-driven installation located in the Mint. The demand, however, rapidly outgrew this plant, and a few years ago a new power station built on a rocky promontory in the Hussain Sagar Lake came into operation. This is equipped with "unit" coal pulverisers, water-tube boilers, and 6 600 V three-phase turbo-alternators. The lake water is circulated for condensing purposes. A general supply is given for public and private lighting in Hyderabad City, and also in the British Cantonment of Secunderabad a few miles away. Although there are several other towns of importance in the Nizam's broad dominion, only one of them (Aurungabad) has yet been equipped with a general system of electrical distribution.

Indore.—Is about to put down a new power station in the heart of the industrial area of the city, in which there are nine cotton mills and sundry other industries. This will generate three-phase energy at 6 600 V, and the initial plant will be oil-engine driven on account of the difficulty in obtaining sufficient water for steam operation. Mr. Palairet, the Minister responsible, estimates that a 10 000 kW plant will be necessary in a few years' time.

Travancore State.—Has just instituted an electric supply undertaking at a cost of over Rs. 4 lakhs for supplying the capital, while four small water power plants are in operation in the tea districts.

Jaipur State.—In 1926 put down an up-to-date oil-engine driven power house and a complete system of underground mains in the City for street lighting and general supply.

Udaipur.—Is about to instal a small steam power house for palace lighting and general supply.

Hydro-electric Schemes.

Mr. J. W. Meares, in a paper read before the Royal Society of Arts in 1922, described the arduous work which had been carried out by him and his colleagues in connection with the location and assessment of the water power resources of India, and the schemes which had at that date been carried out.

Since then three outstanding projects have presented themselves for record :—

The Tata Power Company.—This company's scheme forms the third section of the development of water power in the Western Ghats for transmission to Bombay City and its environs, so courageously undertaken by the firm of Tata and Sons. The first two sections, viz., those of the Tata Hydro-Electric and the Andhra Valley companies were dealt with in the paper presented to the R.S.A. by Mr. Alfred Dickinson in 1918. The triple installation is perhaps almost unique, inasmuch as energy is entirely derived from rainfall averaging 200 inches a year and stored within the actual catchment areas. Electricity supply must, therefore, be sold by the kilowatt-hour as in the case of thermal power stations, whereas undertakings deriving their power from the harnessing of rivers can enter into contracts for supply on the basis of the kilowatt-year, as the flow continues whether transformed into electrical energy or not.

The combined output of the three undertakings, according to the latest available figures, is 280 million units per annum, and the maximum joint load so far recorded on the power houses 120 000 kW—i.e., less than two-thirds the installed plant capacity, while an annual load factor of only 25% is revealed. The Bombay mill troubles must be blamed for the poor load factor, but it is evident that additional outlets for the power supply must be sought before this important combination is loaded up to a favourable economic level.

Madras Presidency.—Estimates have recently been put forward in connection with a 40 000 H.P. development in the Nilgiris called the Pykara-Moyar project, involving the construction of two power stations in series hydraulically, and with heads of 3 250 and 1 000 ft. respectively. It is proposed to transmit at 150 000 V along the Southern India Railway to Madras, a distance of 350 miles. The total outlay, including Rs.130 lakhs for transmission lines, is put at over Rs.4 crores, and it is apparently anticipated that the necessary revenue will be obtained at the comparatively high average bulk supply rate of 0·80 anna per unit sold. The justification for transmitting 350 miles, with all the risks and losses involved thereby, in order to sell electrical energy at a rate higher than that possible with a thermal generating station on the spot appears to be somewhat doubtful.

Millions of Water Horse Power.

Apart from these projects little further appears likely to be done with India's millions of water horse power. Hydro-electric propositions may be divided into two broad categories :—

Those involving transmission in bulk to one or two districts offering large demands, and of which the Tata scheme is an instance, and those involving distribution over wide areas to scattered demands of small individual magnitude, as is proposed in the Punjab.

In the first case the capital outlay per kilowatt capacity rendered available may be from three to five times that of a local thermal power station, and as improvements recently made and foreshadowed in steam boiler and turbine efficiciencies bring the fuel portion of the cost of supply down to low levels, the disparity in capital charges will generally place the thermal station in a favourable position. Moreover, as the cost of the supply of electrical energy varies inversely as the output sold per unit to capital expended, it follows that hydro undertakings are far more sensitive financially to any departure from the ideal conditions of operation, viz., those of continuous output at the maximum capacity for which they have been equipped.

Turning to the second category, that of long distance distribution, the heavy cost of tapping high voltage lines creates a serious financial handicap. For lines of 100 000 V and upwards, the cost in the present state of the art is more or less fixed irrespective of the demand to be fed, and if all proper safeguards are taken is probably in the neighbourhood of Rs.2 to Rs.3 lakhs per tapping, a very heavy initial outlay in respect of supply to a small town or village.

Furthermore, reliability and stability factors enter prominently into the question of long distance transmission and distribution, while the difficulty of effecting an adequate inspection patrol is emphasised under Indian conditions.

Except in specially favourable cases, therefore, it is to be feared that the results of the work of the surveyors of the water power resources of India are likely long to remain of academic interest only.

Industrial Electrical Developments.

The great sub-continent of India, which is larger than Europe without Russia, has diametrically opposite labour characteristics from those with which we are accustomed at home, inasmuch as the lure of the country rather than that of the city is predominant among its population.

Accommodating a fifth of the human race with three-quarters of its inhabitants devoted to the cultivation of the soil, less than 10% of whom are literate, with its hundred languages and thousand dialects, India has been described by a great journalist as an ocean of all-pervading agriculture studded with a few widely scattered industrial islands.

This description may be emphasised by recording that India has only 33 cities with a population of over 100 000, few of which may be characterised as industrial in the Western sense, but that it possesses 700 000 villages—in which cottage industries are carried on during the periods of enforced agricultural idleness imposed by seasonal conditions.

(*To be concluded*).

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Supply Authorities and Advertising.

[To the Editor.]

Sir,—It was recently pointed out in one of your articles on advertising for electrical contractors that the provision of decorated vans in local processions and carnivals was a cheap and effective form of publicity. While agreeing entirely to this view I would suggest, as a commercial man having close contact with electricity supply undertakings, that many of our supply authorities could with advantage make more use of this kind of publicity.

Part of the Colchester Electricity Department's display at the recent Hospital Carnival.

Chancing to be in Colchester at the time of the Colchester Hospital Carnival I secured the enclosed snapshot of part of a most effective display, which inquiry showed was prepared by the staff of the Corporation Electricity Department under the personal direction of Mr. Bacon, the commercial engineer, and was awarded a silver cup in a competition in which the Mayor of Maidstone acted as judge.

It may be of interest to some supply engineers to have a brief description of the display. It was mounted on a 5-ton lorry, gaily decorated in bright green and yellow. The back half was fitted out with a model of an old Essex mill grinding the corn. This was manned by the electricity department's carpenter dressed as a miller of the period, and sails were made to revolve by a set of accumulators fitted in the base of the mill, connected to a 12 V starting motor (taken from a car for the purpose).

The portion nearest the driver was fitted as a model labour-saving kitchen of 1929, with de luxe all-enamel "Creda" cooker, an "Inventum" water heater fitted over the sink, a "Creda" electric iron on the kitchen table, and a "Hoover" suction cleaner in the corner. Mrs. Petersen, the Credenda Co.'s demonstrator, sat in an easy chair waiting for the food to cook.

A long stick with a "Hoover" bag at the end was used from the car for collecting for the hospital, and 245 coins were counted at the completion of the tour of the town.—I am, etc.,

G. W. L.

Northampton.

"Television and the B.B.C."

[To the Editor.]

Sir,—May I say that I do not agree with your views as given in your issue of July 26th.

I do not believe that there is any public demand for television in its present stage, and, having given many years' attention to the subject, I am of opinion that facilities for public exhibition will have no effect on the progress of the art.—I am, etc.,

A. A. Campbell Swinton.

40, Chester Square,
London, S.W.1.

Battersea Power Station.

[To the Editor.]

Sir,—The London Power Co., Ltd., have noted with regret the renewed attacks that have recently been made in the Press and elsewhere upon the Battersea power station, and this notwithstanding the assurances that have already been given on behalf of the company.

Unfortunately, those from whom these attacks emanate have displayed no desire to ascertain the steps taken by the Power Co. to fulfil their obligations and to meet the objections to the erection of this station.

The Power Co. desire to state in the most emphatic manner that their engineers and chemists have evolved a perfectly practicable and commercial solution of the "sulphur problem" in which they have complete confidence, and that the menace feared will be non-existent so far as the Battersea station is concerned. Letters patent have been applied for in connection with the process.

The method and the results have been inspected by the Government chemists, and a full and complete report is about to be issued by the Power Co. to the Electricity Commissioners.—I am, etc.,

W. F. Fladgate,
Chairman, London Power Co., Ltd.

Horseferry Road,
Westminster, London, S.W.1.

Researches in Circuit Breaking.

[To the Editor.]

Sir,—I have read Mr. Dunton's lengthy contribution in your issue of July 19th, and in so far as he criticises the Electrical Research Association, I would say that his criticism is based on a mis-statement of the case, and there is, therefore, nothing for the Association to answer.—I am, etc.,

E. B. Wedmore.
Director and Secretary,
British Electrical and Allied Industries Research Association.

36 and 38, Kingsway,
London, W.C.2.

[To the Editor.]

Sir,—I am glad that Mr. Dunton has now stated what he considers to be the "wrong idea" in the method of calculation which I described in "World Power" in January, 1925, and which though not a report of the Electrical Research Association, has been adopted by them.

He states that the method depends on the equation

$$H = 2i/X^2$$

It does not! It is a graphical method depending on the equation

$$H = i\int \frac{\delta\theta}{r}$$

But the equation

$$H = \frac{iX}{Z\sqrt{X^2+Z^2}} + \frac{iY}{Z\sqrt{Y^2+Z^2}}$$

given on page 26, is mentioned incidentally as leading to algebraical methods of comparatively limited application. If X and Y are both large it is obvious that

$$H = \frac{2i}{Z}$$

but by accident this was printed as

$$H = \frac{2i}{Z^2}$$

The original draft was correct, but parts of the method were, for convenience, embodied on a tracing, and the Z^2 crept in at this point, and found its way into print when the method was subsequently published; the x^2 and r^2 on page 30 can be traced to the same source.

The method described is applicable to two-dimensional problems only, and as there seems to have been so much misunderstanding, the description will be repeated in an account of a more elaborate method applicable to three-dimensional problems which I hope to publish shortly.—I am, etc.,

W. Fordham Cooper.

16, Ferme Park Mansions,
Ferme Park Road,
London, N.8.

"Postmark Publicity."

[To the Editor.]

Sir,—While I agree with your remarks on postmark publicity, may I suggest that firms making use of it should keep up to date any slogans that are meant to be topical? Just after reading the note on this subject in your July 26th issue I received a letter from a London supply company bearing the message "Summer is Coming. Order your Electric Fans Now."—I am, etc.,

London, S.W.7. Publicist.

NEWS IN BRIEF.

Communists and Electrical Works — Situations Vacant—The Mayor of Brighton Entertains—An Ontario Claim—Engineering Wages—Transformers for 2 000 000 V.

A PORTABLE type X-ray apparatus is to be installed at the Sculcoates Union.

An "electric cabinet" for the destruction of animals is being used at Derby instead of a lethal chamber.

Luton electricity undertaking showed a gross profit for the past year of £67 000 and a net profit of £26 000.

A commercial assistant is required in the borough of Bromley electricity department.

Horse-racing under electric light was successfully tried out in the United States for seven nights last month.

Electricity is to be installed at the extensions of Bingley Grammar School at a cost of £284.

Tubular heating is to be installed in the committee room at the Poplar Borough Council offices.

Bradford Baths Committee recommends installing an electrically driven hydro-extractor in the laundry at the Windsor Baths.

Yeadon Education Committee is to instal electricity at the Yeadon and Guiseley secondary school at an estimated cost of £350.

A site in Ford's Yard, Brandon Road, Belle Isle, is to be bought by Islington Electricity Committee for the erection of a sub-station.

The Metropolitan Asylums Board is to instal a goods lift at Darenth Training Colony, at a cost of £325, and electric lifts in the North Western Hospital are about to be reconstructed.

Steps are about to be taken by the Birkenhead Electricity Department to introduce an assisted wiring scheme.

An exhibition arranged by Lytham St. Annes Electricity Department was opened last week in Holy Trinity Schools, Kirkham.

Additional premises to the number of 2 326 have been connected to the mains of the Birmingham electricity undertaking during the last three months.

A technical officer is required at the Royal Aircraft Establishment, South Farnborough, for writing descriptive matter and instructional handbooks on wireless and electrical apparatus. Form from Chief Superintendent. (Reference A. 358.)

Messrs. Philips, of Eindhoven, Holland, manufacturers of electrical and wireless equipment, having dismissed a large number of Communist employees, the police guard on the firm's works has been considerably reinforced, as foul play is feared.

Fire broke out in the toolshop at the Streatham Hill works of the Relay Automatic Telephone Co. on Monday evening, when 50 girls made good their escape. The company's brigade checked the fire in 30 seconds and three London brigades answered the district call. See page 151.

The Swansea Branch of the Electrical Association for Women spent an afternoon at St. Madoc, Broughton Bay, Gower, last week, by invitation of Mrs. Burr, chairman. About 50 members attended and after tea Miss Burr presented a playlet entitled "The Lady Interviewer."

The electrical equipment in the White Star Line's 27 000-ton motor vessel, the "Britannic," which is to be launched from Harland and Wolff's Belfast shipyard on August 6th, includes nearly 200 motors ranging from 1 to 170 H.P. In addition to the operation of lifts, water-tight doors, steering gear, winches, pumps and auxiliary machinery, electricity will be used in connection with cooking, ice cream making, potato peeling, printing, etc.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated August 2nd, 1879 :—*

An underground telegraph cable was laid between Hamburg and Bremen, and Oldenburg and Emden.

Dr. C. Herz, European concessionaire for Edison's quadruplex system, was invited by the French and Belgian Governments to place at their disposal apparatus for quadruplexing the line between Paris and Brussels.

* * *

TWENTY-FIVE years ago, it was stated in THE ELECTRICIAN *of August 5th, 1904, that :*

The author of a paper on boiler house problems said that "none of the items which make up the total costs of production, with the exception of coal, are capable of being materially reduced, as the economical limit has been reached."

Although there were signs of an inclination towards the erection of overhead lines up to, say, 10 000 V, it was doubtful whether this figure would frequently be exceeded in this country owing to the short distances over which it was necessary to convey energy.

* * *

FIFTEEN years ago THE ELECTRICIAN *dated July 31st, 1914, reported that :*

The tercentenary of Napier, the inventor of logarithms, was celebrated in Edinburgh.

Mr. R. Birkett, of Southend, was the first municipal electrical engineer to order an electric battery 'bus.

A special committee of the London County Council recommended that Parliamentary powers should be sought to establish a new authority to unify electricity supply in London.

The accounts of the St. Pancras (London) electricity undertaking for the year ended March 31st show a net profit of £37 586.

Fourteen hundred guests were entertained by the Mayor and Mayoress of Brighton (Alderman and Mrs. Galliers) at a garden party at the Royal Pavilion last week.

Swansea Education Committee recommends the overhaul of the electric lighting and heating installation at the training college.

A 2 000 000 C.P. beacon is to be erected at Chicago for the guidance of aircraft. The new light will be called the Lindbergh Beacon.

At a meeting of the Finchley Council last week it was stated that the electricity department required 9 000 tons of coal, but had been able to obtain only 5 000 tons.

Sanction to borrow £675 for the purchase and adaptation of property and a sub-station plant at White Lund, has been received by Morecambe Electricity Committee.

Fulham B.C. has voted £78 15s. for the conversion of the lighting supply in the new part of the town hall building from 100 to 200 V, and for the improvement of lighting in refreshment rooms.

In a recent lecture at Dresden on the development of e.h.t. equipment, Dr. Reiche declared that the firm of Koch and Sterzel had just succeeded in constructing test transformers capable of handling 2 000 000 V.

New showrooms of the York Electricity Department were opened in Clifford Street on July 26th, by Ald. C. W. Shipley, chairman of the Electricity Committee.

The working of the Maidstone electricity undertaking for the year ended March 31st shows a profit of nearly £14 000, of which £4 000 will go to the relief of rates.

It is stated that Ontario, Canada, has a greater density of h.t. hydro-electric power lines than any other country in the world. Amongst the newest of these lines is a 220 000V transmission line, 220 miles in length, from the Gatineau river to Toronto. A second line at the same voltage over the same route is now being erected.

There was an interesting exhibition of electro-medical appliances in the exhibition held in the City Hall, Manchester, last week, in connection with the annual meeting of the British Medical Association. Apart from hospital equipment and utensils, there were on view several specimens of electric aids to good hearing, X-ray outfits, scientific instruments, etc.

The number of telephones in the United States has increased during the past five years by an average of 5·8% per annum, while the population has increased at the average rate of 1·50%. Florida with 103·7% shows the largest rate of increase over the period. California ranks second with an increase rate of 57·9%, and New York State shows an increase of 45·8%. The total number of telephones in the U.S. at the close of 1927 was 18 522 767 or one to about every 6 of population.

At a conference of engineering unions in London last week it was decided that an application be made to the Engineering Employers' Federation for a further conference, to be held in the third week of September, for the purpose of hearing their considered reply to the unions' application for an increase in wages of 8s. per week for time workers, with a corresponding increase in piecework prices. Also a deputation is to urge upon the Foreign Secretary the desirability of closer trade relations with Russia.

PERSONAL.

MR. Herbert W. Young, president of the Delta-Star Electric Co., of Chicago, who has been on a short trip to this country following attendance at the Paris Conference on Large Electric Systems, sailed for the United States on Wednesday by the "Olympic." Interviewed before leaving by a representative of THE ELECTRICIAN, Mr. Young said that apart from the courteous reception given to Americans by the English electrical manufacturers, and their willingness to show their designs and products in detail, he was impressed with the great personal interest which British executives were showing in their switchgear departments. This was particularly true of the outdoor switching equipment, and he looked forward to its greatly increased use in England. Mr. Young thought that the advisability of using higher insulation values on the switches than were employed on the transmission lines had not in some cases been given quite the consideration that electrical engineers in the States thought was necessary. He felt, however, that the importance of this feature would be demonstrated as more experience was gained in actual operation.

Mr. Herbert W. Young.

"In the States," Mr. Young added, "it is standard practice to over-insulate the switching on outdoor sub-station equipment, so that under over-voltage conditions flash-over will not occur at those points, but will be confined to more easily replaced line insulators. This practice is followed whether or not lightning arrestors are used."

In view of the interest shown by executives Mr. Young thought there was no doubt that English-made high tension outdoor type switchgear would soon reach the high standards established by the self-contained or enclosed type of gear.

"I am returning to America," Mr. Young concluded, "with a very favourable impression of England and its business men, and I feel confident that a steady exchange of ideas between British and United States electrical engineers will be of great benefit to both countries."

Mr. Harry Pollitt has been appointed relief charge engineer at Darlington Corporation's electricity works. Mr. Pollitt has been junior charge engineer at Burnley for some time.

Mr. Richard Vynne Southwell, F.R.S., has been appointed professor of engineering science at Oxford University in succession to Prof. C. F. Jenkin.

Mr. R. H. Paterson, chief assistant electrical engineer to Hammersmith (London) B.C., has been appointed borough electrical engineer, in succession to the late Mr. F. Hill.

Senator Marconi has left Gaeta in his yacht "Elettra" for Spain, Great Britain, and Germany, and it is stated that he intends to make further experiments in long-distance wireless telephony.

The marriage of Mr. Edward Dyson, of the Rugby staff of the British Thomson-Houston Co., Ltd., and Miss Ellen Thomson, was solemnised at Christ Church, Sowerby Bridge, on July 15th.

Mr. A. Nichols Moore, borough electrical engineer, Newport, has been appointed representative of the I.M.E.A. on the British National Committee of the Welfare Conference which meets in Berlin next year.

Morecambe Electricity Committee has decided to increase the salary of Mr. M. J. Mortimer, borough electrical engineer, by £100 for the forthcoming year, and subsequently two additional increases of £50 each.

Mr. M. B. Esson, assistant secretary of the New Zealand Posts and Telegraphs Department, has been appointed as New Zealand's permanent representative on the Imperial Communications Advisory Committee.

The marriage of Mr. Fred Iredale, who has for nine years been on the staff of Halifax Electricity Department, and Miss Annie Sugden was solemnised on July 18th. The bridegroom received from his colleagues a canteen of cutlery.

At the last monthly meeting of the Ayrshire Electricity Board ex-Provost Mathew Smith, the chairman, presented to the board a replica of his portrait in oils which had been gifted to him by Kilmarnock Town Council and other friends.

Mr. F. A. Rogers, who has been with the Marconi's Wireless Telegraph Co., Ltd., at Chelmsford, for seven years, has resigned his position as chief of the estimating department, having accepted an appointment abroad, and he is succeeded by Mr. R. H. Cox.

Sir Courtauld Thomson has been elected chairman of the Imperial Communications Advisory Committee, the body concerned with the policy of the new Imperial and International Communications Company formed by the cable and wireless merger. Sir Campbell Stuart is to be deputy chairman and Sir Norman Leslie, secretary. Sir Campbell at one time represented Canada on the Pacific Cable Board.

Mr. F. A. Merrick has been elected president of the Westinghouse Electric and Manufacturing Co., Ltd. In announcing this fact Mr. A. W. Robertson, chairman, stated that the Board, while accepting the resignation of Mr. E. M. Herr, president since 1911, in order that he might go on an extended vacation, had elected Mr. Herr vice-chairman. Mr. Merrick advances into the position of president from the position of vice-president and general manager.

Among those upon whom the Council of the City and Guilds of London Institute have conferred the distinction of Fellow of the Institute (F.C.G.I.), are Mr. G. J. Gibbs and Mr. C. D. LeMaistre. The Fellowship is conferred by the Council upon those who, having obtained the Associateship of the Institute and spent at least five years in actual practice, produce evidence of having done some original and valuable research work, or of having otherwise contributed to the advancement of the industry in which they are engaged.

Mr. James Hargeaves, aged 20, of Ennismore Street, Burnley, who has obtained a First Honours B.Sc. degree at Manchester University, has carried off prizes for occupying the top place in his class in the electrical engineering course. The Royal Commission for the Exhibition of 1851 has also awarded him an industrial bursary. He will take up an appointment at Ferranti's, Ltd., Hollinwood, on August 5th, and the bursary (the only one offered to his college) is of one year's tenure, to be prolonged a second year provided the Commissioners are satisfied with his work. The salary of Mr. Hargreaves will be supplemented by £175 per annum. The bursary is awarded to enable suitable applicants to tide over the period between leaving college and obtaining remunerative employment.

West Ham Corporation has appointed Mr. J. W. J. Townley, chief electrical engineer of London County Council tramways department, as chief engineer and manager of the West Ham electricity undertaking, in succession to Mr. F. W. Purse, who was recently appointed engineer-in-chief to the London and Home Counties Joint Electricity Authority. Mr. Townley has held appointments on the technical staffs of the Paisley, Manchester, Ashton and Sunderland Corporations electricity supply undertakings and the Trafford Power Company. He went to Barnsley in 1918 as acting borough electrical engineer, and upon the return of Major Barker returned to Sunderland early in 1920 as chief assistant electrical engineer. In 1922 he was appointed deputy city electrical engineer at Bradford and held that position until appointed as electrical engineer to the London County Council Tramways at the end of 1926. See page 151.

Obituary.

MR. BRAILEY DUNLOP, on July 25th, late chief electrician of the s.s. "Berengaria."

MR. GEORGE GRUNDY DEELEY, on July 15th, aged 41 years. He was electrical engineer to the South Lancashire Tramways Co., Ltd., and had just secured an appointment in the electricity department of Hastings Corporation.

MR. A. B. WRAY, on July 20th, aged 43 years, whilst proceeding by boat from Melbourne to Sydney. He was during part of the war period manager of the Luton Corporation Tramways. He had been in Australia for four years.

MR. C. T. BRISCOE, on July 23rd. He was head of the well-known firm of C. T. Briscoe and Son, Ltd., electrical engineers and contractors, Blackburn, and a former chairman of the Blackburn sub-Branch of the Electrical Contractors' Association. See page 151.

MR. GEORGE PRINGLE FAIRLESS, a member of Stockton-on-Tees T.C., on July 8th. Coun. Fairless was chairman of the Engineering and Lighting Equipment Co., Ltd., manufacturing electrical engineers, Sphere Works, St. Albans, managing director of Fairless Engineering Supplies Co., Ltd., and chairman of Stockton Corporation Electricity Committee. He was 43 years of age.

IN PARLIAMENT.

Replies to Questions of Electrical Interest in the House of Commons.

ABOUT 600 000 miles of wire in underground telephone cables were provided during 1928, at a cost of about £4 300 000.

The observations which are regularly taken of the London telephone service do not indicate deterioration. They show that the average speed of answer from the exchange is six seconds.

The cost to the British Government of working the Transatlantic telephone service from Great Britain for the three months up to May 31st, 1929, so far as can be estimated for such a short period, was about £25 000.

There are now three radio telephone circuits in commercial operation between Great Britain and the United States. The transmitters are concentrated at Rugby. The number of calls over these circuits during the three months ended June 30th last was 3 881.

Television Transmissions.

The Postmaster-General has received representations from the Baird Television Development Co. and from the British Broadcasting Corporation concerning the facilities offered for the use of a broadcasting station for experimental transmissions of television.

It has been decided to establish a public service between London and Berlin for the transmission by telegraphy of pictures, photographs and other similar matter. The apparatus has been ordered. It is hoped that the service will be open within two or three months.

The Minister of Transport has received representations from two important local authorities as to the desirability of initiative legislation requiring certification and stamping of all electric meters, and he is in consultation with the Electricity Commissioners with regard to them.

The Minister of Transport understands that an electricity scheme promoted by a local company makes provision for a supply to Millbrook (Cornwall). The Electricity Commissioners hope to be in a position shortly to make a Special Order in respect of this application.

Up to March 31st, 1929, the Post Office beam services had earned gross receipts amounting to £813 100 at a cost of £538 850, leaving a net surplus of £274 250. Since April 1st, 1928, the services have been worked by the Post Office acting as agent for the Imperial and International Communications Co.

The Post Office and Labour.

The amount of work for certain classes of labour employed by the Post Office engineering department has been diminishing for about the last two years, as a result of the catching up of arrears of main construction work and other causes. Lines are not falling into disrepair through employment of insufficient staff.

In the case of telegrams sent by telephone a telephone fee as for a local call is charged in addition to the charge for the telegram. The proportion of telegrams sent by telephone is steadily growing. The Postmaster-General does not see his way to incur the loss of revenue involved in the waiving of the telephone fee.

The Minister of Transport has no power to impose upon any electricity supply company, whether its shares are held by British or American interests, any stipulation as to the source of electrical machinery. The question of legislation on the subject is a wide one which cannot be considered solely in relation to electricity undertakings.

The Foreign Secretary (Mr. A. Henderson) states that the ratepayers of the International Settlement at Shanghai have approved the proposal of the council to accept an offer of 81 000 000 taels (about £10 000 000) for the municipal electricity undertaking. He has no information as to how much of the goodwill is the result of expenditure borne by the British taxpayer.

Before the consent of the Minister of Transport is given under the Electricity (Supply) Acts to the erection of any electric line above ground the local authorities concerned are entitled to be heard at a local inquiry if they so desire. It is not possible for the Minister to limit his freedom of action by laying down the principle suggested by Mr. Lawther, that priority is given to the views of the inhabitants over commercial interests by transmission cables being placed underground.

LEGAL INTELLIGENCE.

Application for Introlocutory Injunction Granted by Master of the Rolls.

IN the Court of Appeal consisting of the Master of the Rolls and Lords Justices Lawrence and Slesser on July 25th, Sir Duncan Kerley, K.C., on behalf of the Edison Storage Batteries, Ltd., said that with the view to an appeal by that company from the judgment of their lordships dismissing their appeal from the judgment of Mr. Justice Clauson granting an introlocutory injunction restraining the company from carrying on business under that name it had been agreed on terms with the plaintiffs, Edison Accumulators, Ltd., that the operation of the injunction should be suspended for six weeks. The Master of the Rolls assented to the application.

Extension of Patent.

Mr. Justice Luxmoore heard in the Chancery Division on July 25th an application by the British-Thomson Houston Co. for an extension of the period for a patent relating to X-ray tubes. The application was opposed by Messrs. Newton and Wright, electrical engineers, Wigmore Street, W., Messrs. Cuthbert and Andrews, manufacturers of scientific apparatus, Red Lion Street, Holborn, and Messrs. A. G. Dean and Co., electrical, medical and scientific engineers, Leigh Place, Holborn.

Sir Arthur Colefax, K.C., for the applicants, said the opponents were contending that the war helped rather than hindered the applicants in working the patent. The characteristic of the invention was that prior to the war these X-ray tubes which were used in the process of taking photographs depended for their efficiency upon gas, but this invention disposed of the use of gas, the tube being charged exclusively by the heat of the cathode which was one of the electrodes. It was called a Coolidge X-ray tube, and belonged to the General Electric Co., of America, who had communicated the patent to the applicants. The patent expired in June last.

His Lordship granted an extension for one year.

Inadequate Guarding of Wires.

Messrs. J. L. Clarke Chapman, electrical engineers and foundrymen, of Gateshead, were fined £50 and costs at Gateshead recently for a breach of the Home Office electricity regulations. It was stated by Mr. H. R. Rogers, an Inspector of Factories, that the firm had several "live" wires, carrying current to work overhead cranes, which had been covered by asbestos boarding. Owing to the heat of the molten metal carried by the cranes, this had been charred away and the wires were exposed in several places. On March 16th an apprentice foundryman, Wilfred Hughes, was carrying a metal carrier which came into contact with the wires. He received a shock of 200 V and never regained consciousness, dying soon after. Mr. J. H. Taylor, on behalf of the firm, said this was the first example of want of thorough inspection the firm had had in 60 years.

NEW SCREENED GRID VALVE.

A USEFUL addition to the range of valves manufactured by The Mullard Wireless Service Co., Ltd., of Nightingale Works, Nightingale Lane, Balham, London, S.W.12, and 111, Charing Cross Road, London, W.C.2, is the P.M.16. This is a low temperature filament h.f. screened grid valve, for use with a 6 V accumulator; it is stated to be the only 6 V screened grid valve on the market in this country. Although the internal screen avoids retro-active coupling through anode-grid capacity, it is necessary to screen the various circuits as completely as possible in order to avoid any stray electro-magnetic or electrostatic coupling external to the valve. In a well-designed h.f. amplifier circuit of the "tuned-anode" type, the amplification per stage is said to be very much greater than that obtainable by the use of a completely "neutralised" normal three-electrode valve. Two methods for using the valve for h.f. amplification are available. The circuit employing shunt feed to the anode of the h.f. valve is usually preferable. In both cases, the anode-bend system of rectification is advocated, so that the least possible amount of damping shall be introduced into the "tuned-anode" circuit. If a variable high resistance ($\frac{1}{2}$ to 1 megohm maximum) be connected across the tuned anode circuit, external screens may be omitted. Care must be taken that disturbance is not caused by radiation from the aerial.

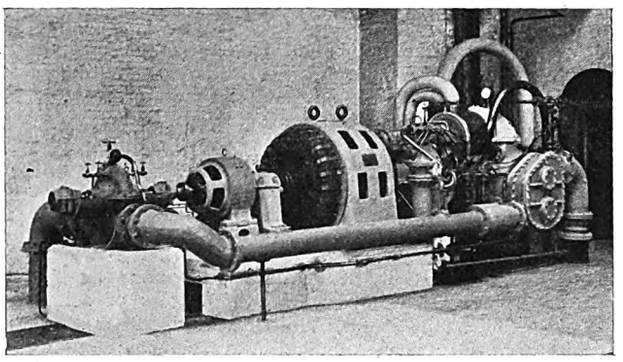
POWER PLANT.

Some Recent Contracts for Large Units and Small Self-contained Sets.

RECENT contracts placed with the Metropolitan-Vickers Electrical Co., Ltd., for turbo-alternator sets show an interesting variety of equipment, ranging from very large units for interlinked main power stations down to sets of



A "Metro-Vick" 625 kW self-contained turbo-alternator set in the Bromley works of the Gas Light and Coke Co., Ltd.

medium and small capacity for industrial power plant installations. The large units include a 50 000 kW set for the Liverpool Corporation, a 32 500 kW set for the Victoria Falls and Transvaal Power Co., and three 12 500 kW sets for the Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board. The smaller sets are mainly of the self-contained type.

The 50 000 kW set for Liverpool, though not the largest of the sets which the Metropolitan-Vickers Co. has under construction, is one of the notable units which are being built for power stations in this country. It is to form the initial installation in the new Clarence Dock power station. The first set is to consist of a 51 250 kW turbine driving, at 1 500 r.p.m., a main alternator of 71 500 kVA, and a 1 562 kVA house service alternator, both alternators being excited by a double exciter also directly driven. The rated output of the set is 50 000 kW measured at the h.t. terminals of the step-up transformers. The turbine is normally to operate with steam at 400 lb. pressure and 800 deg. F. total temperature, but it will also be capable of giving full output with steam at 340 lb. pressure and 675 deg. F. The condenser is to be of the central-flow type. The main alternator, which will generate at 7 250 V, and the auxiliary generator will both be ventilated on the Metropolitan-Vickers patent closed-circuit system, with an air-cooler capable of dealing with 120 000 cubic ft. of air per min. serving both machines. In addition to the equipment above mentioned, the contract includes the step-up transformer equipment for the set, consisting of two 37 500 kVA 7 250/33 000 V three-phase core-type units, together with auxiliary switchgear.

The 32 500 kW set for the Victoria Falls and Transvaal Power Co. is for an extension to the Vereeniging power station, which is one of a chain of large steam power stations serving the mines and other industrial activities of the Rand. The set is to run at 3 000 r.p.m. with steam at 200 lb. and 330 deg. C. The alternator will have a capacity of 40 000 kVA, generating at 10 500 V 50 cycles, and will be accompanied by a closed circuit air-cooler equipment. The condenser will again be of the central-flow type. The cooling water will be taken from the Vaal River, on the bank of which the power station is situated. The Vereeniging power station is linked by an 80 000 V line with the company's 132 000 V Witbank transmission system, for which the transformers and switchgear were supplied by the Metropolitan-Vickers Co.

The three 12 500 kW sets for Stalybridge are required in connection with the change of the system from 40 to 50 cycles, the Hartshead station, in which they are to be installed, being one of the selected stations for the "grid" scheme. The sets are to operate at 3 000 r.p.m., generating at 6 300/6 600 V. It is of interest to note that with the two 7 500 kW Metrovick turbo-alternator sets which the new equipment is to replace, this comparatively small station has achieved a remarkably high efficiency and remarkably low running cost. The latest published returns, for the year ending March, 1928, show a total cost per unit, including management and all other expenses, amounting to only 0·43d. per kWh sold. The total power generated during the period mentioned was just over 40 million kWh, the load factor being 31·8%.

Of the small self-contained sets the range of standard sizes is from 200 kW to 4 000 kW, and, within the short period which has elapsed since these sets were put on the market, about 70 sets have been supplied or are now on order. Of these a considerable number are for the British Navy, some are for the navies of Chile and Japan, and the remainder are for various industries in this country and abroad.

The variety of the industrial applications is indicated by the most recent orders, which include two 2 000 kW sets for collieries in the Federated Malay States, a 1 000 kW set for a paper mill in China, a 1 000 kW set for a copper mine in Rhodesia, a 750 kW set and two 280 kW sets respectively for an ironworks and a jute factory in India, and a 2 800 kW set for an ironworks in Belgium. The last mentioned order is noteworthy in that the installation is for what may be called the home continental area, in which the competition of continental manufacturers is very keen.

TRADE PUBLICATIONS.

THE subject of dust removal is dealt with in booklet K.189 by the JAMES KEITH AND BLACKMAN CO., LTD., 27, Farringdon Avenue, London, E.C.4.

The HACKBRIDGE ELECTRIC CONSTRUCTION CO., LTD., Hersham, Walton-on-Thames, has published a special leaflet with respect to the closing of the works from August 3rd to 12th on account of the annual holidays.

We have received from MARCONI'S WIRELESS TELEGRAPH CO., LTD., Marconi House, Strand, London, W.C.2, copies of leaflets Nos. 1 094, 1 095 and 1 098 describing direction finders types 11g, D.F.M.3 and D.F.M.4 respectively.

"Noise! the Problem of Industry" is the title given to a new publication by S. G. BROWN, LTD., Avenue Chambers, Vernon Place, London, W.C.1. The issue, which is fully illustrated, deals with electro-megaphones for all uses.

A summary of current information on nickel is contained in Vol. 1, No. 1, of "The Nickel Bulletin," published by the Research and Development Department of the MOND NICKEL CO., LTD., Imperial Chemical House, London, S.W.1.

The PORTER PATENT SAFETY SEALS, LTD., 7/9, Belfast Road, London, N.16, have issued a new publication in the form of a puzzle. The new issue is sealed, and the trade is asked to open it without breaking the seal. It is so good a puzzle that it even beat that practised person—the office boy!

We have received from CONSTRUCTORS, LTD., of Imperial House, Charlotte Street, Birmingham, a copy of a new shelving leaflet which should be of interest to electrical contractors. The booklet deals with steel shelving and similar fittings for both showroom and office use, as well as fittings for storerooms, etc.

The B.E.N. PATENTS, LTD., 92, Tottenham Court Road, London, W.1, have published two new catalogues dealing with air units and mechanical polishers respectively. Each of these catalogues deals in a concise and convincing manner with the merits of the goods described. Both publications are well illustrated and all possible particulars are given.

The ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, London, W.C.2, has sent us a copy of publication No. 947, illustrating and describing oil-immersed circuit-breakers, Class OKD.1 for outdoor use on circuits up to 33 000 V. We have also received a copy of an attractive little leaflet which has been issued for friends and prospective customers desiring to visit the Bradford works.

It is interesting to note that 122 separate installations have been completed, or are on order, for high power rectifiers to operate at d.c. pressures exceeding 1 000 V. In practically every instance they are required for railway work, while in several cases they are automatically operated. Particulars of the equipment are the subject of list No. 204, by BRITISH BROWN BOVERI, LTD., of Trafalgar House, Waterloo Place, London, S.W.1.

We have received from the UNITED STRIP AND BAR MILLS, LTD., Sheffield, a handy pocket-size booklet setting out the various sections of steel strip and bar available. Many useful tables are also incorporated. It is of particular interest to learn that United Strip and Bar Mills, Ltd. (which is a branch of the United Steel Companies, Ltd.), have a service department whereby reinforcement bar is supplied in lengths, ready bent, hooked, marked and bundled, and delivered to suit the contract. A department under a ferro-concrete engineer will also get out quantities and advise generally on ferro-concrete construction.

THE NATIONAL REGISTER.

List of Registered Electrical Contractors Strengthened by Further 24 Names.

AT a meeting of the Executive Committee of the National Register of Electrical Installation Contractors on July 23rd, 31 applications from electrical contractors for registration were considered. Of this number 24 were accepted, 2 were withdrawn, and 5 were declined.

The following are the names and addresses of the successful applicants :—

Neale, A. E., 46, Crowthorn Road, Ashton-under-Lyne.
Mathers, James S., 5A, Craven Road, Woodhouse, Leeds.
Drape and Upton, Ltd., 77, Welbeck Street, Hull.
Jennings, Wm. Arthur, 37, Easy Road, Leeds.
Hirst, George H., Lodge Lane, Beeston Hill, Leeds.
Jones, William, Bromford Lane, Ward End, Birmingham.
Morrish and Robertson, 3, Green Dragon Yard, Leeds.
Galvert, William, 71, Raglan Road, Leeds.
West Park Electrical Co., 570, Thornton Road, Bradford.
Randall's, 21, Mount Street, Cromer.
Roberts, Hugh, 211, Walton Village, Walton, Liverpool.
Taylor, Edwin, 106, Stamford Street, Stalybridge.
Parsons, Albert E., 403, Sheffield Road, Whittington Moor, Chesterfield.
Jones, Oswald, and Co., Mill Street, Maidstone, Kent.
Manning, John, and Co., 23, Coleshill Street, Birmingham.
Lowe, T. and G., 2, Cricklewood Lane, Cricklewood, London, N.W.2.
Western Electricity Supply Co., Ltd., Cainscross, Stroud, Glos.
Randall, William, 75, Spencer Street, Birmingham.
Priest, Thomas R., 2, Market Place, Blackheath, Birmingham.
Hullah, E., and Co., Grey Street, Stockton-on-Tees.
Hallam, Gifford, 168, Hall Street, Stockport.
Scott, Herbert, 19, Oldham Road, Ashton-under-Lyne.
Bustin's, J., Electrical Works, Horse Fair, Banbury.
Leeds Corporation, Electricity Department, 1, Whitehall Road, Leeds.

THE SOCIAL SIDE.

PRITCHETT and Gold won their home cricket match with A.B.C. last Saturday by 103 runs to 31.

St. Helens Cable Co.'s cricket club head the Slough Estate League, having so far played seven matches and won six, the other one being lost.

Nottingham Corporation Tramways cricket team were defeated by Sheffield Tramways by three wickets last week. Nottingham scored 100 and Sheffield 102 for 7 wickets.

On the occasion of their recent annual staff picnic the employees at Warrington Corporation electricity works paid a visit to Helsby, where the party of 60 were the guests of British Insulated Cables, Ltd.

On June 29th the directors and staff of A. H. Hunt, Ltd. enjoyed the annual outing, which again took the form of a charabanc journey to Brighton, where the day was spent. A suitable presentation was made to each of the directors by a member of the staff, who, incidentally, was the young lady with the longest service. In acknowledging the gifts Mr. A. H. Hunt, managing director, remarked how pleased he was

The staff of A. H. Hunt, Ltd., outside the works before starting for Brighton.

to see the continual growth of the staff, and Mr. C. H. Hunt also pointed out that, in addition to the growth from the point of view of numbers, it was very noticeable that the advancing age of the staff had increased, not because the members were a year older, but because it had been found possible to find employment for more senior employees, and the hope was expressed that during the next 12 months further increases in the staff would take place in view of anticipated developments. A start was made for home at 6.30, the journey being interrupted at Handcross for a short sing-song and dance, and the arrival back at the works at approximately 10.30, completed an enjoyable and very successful day.

BUSINESS ITEMS.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, announce that the range of "Phililite" commercial diffusing units has been the subject of considerable price reductions.

The Acton works of S. G. BROWN, LTD., will be closed from to-day (Friday) until August 12th, on account of annual holidays and stocktaking. A small staff will, however, be in attendance for matters of urgency.

THE stand of the Chloride Electrical Storage Co., Ltd., at the International Aero Exhibition, which concluded at Olympia last week. Prominent among the exhibits was the "Keepalite" panel, which was wired in conjunction with the stand circuit. This panel, which operates in connection with batteries, automatically switches on emergency lights when any interruption takes place in the normal source of supply. The automatic action of the panel was demonstrated on the stand and caused considerable comment. Other exhibits included a full range of batteries designed for the starting and lighting of aircraft, and also of low and high tension wireless batteries. *See page 148.*

J. A. CRABTREE AND CO., LTD., Lincoln Works, Walsall, announce that, on and after Wednesday, August 7th, the address of the London office and depot will be 12, Dyott Street, New Oxford Street, W.C.1. Telephone: Temple Bar 2741 (two lines).

We are advised by the ALTON BATTERY CO., LTD., of Alton, Hants, that the trade discount on "Alton" batteries has been increased and the exclusive buying agreement which has been issued by the company has been revised. This document is now termed a Traders' Agreement and signatories receive a cash settlement discount of 5% on their purchases of "Alton" batteries.

EDISON STORAGE BATTERIES, LTD., Victoria House, Southampton Row, London, W.C.1, announce that they are a new company formed by the manufacturers, the Edison Storage Battery Co., of Orange, New Jersey, U.S.A., to carry on the sale and distribution of Edison storage batteries in this country. In order to avoid confusion of the company's name with that of another company, Edison Storage Batteries, Ltd., are taking steps to change their name to "NEW DISTRIBUTORS OF EDISON STORAGE BATTERIES, LTD."

The ENGLISH ELECTRIC CO., LTD. has received an important contract from the London County Council, for 50 double-deck, all-steel tramcars and 100 motor equipments. The cars will each have seating accommodation for 28 passengers in the lower saloon and 46 passengers in the upper saloon. The equipments will each consist of two 57·5 H.P. motors with controllers, circuit breakers, resistances, cabling and trolleys. The cars and equipments will be built at the company's Preston works. The total value of the contract is £160,450.

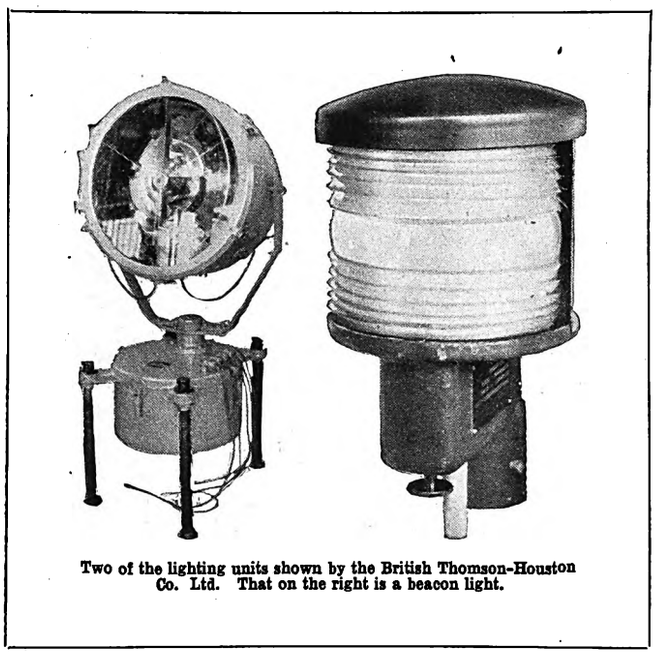
AERO EXHIBITION.

Some of the Electrical Items Which Were Among the Exhibits.

AMONG the electrical exhibits of particular interest at the International Aero Exhibition, which concluded at Olympia, London, last week, was a range of aerodrome lighting equipment shown by the British Thomson-Houston Co., Ltd. The equipment was divided into two groups, that required for the guidance of pilots desiring to land or take off, and general illumination which included the lighting of hangars, forecourts, repair sheds, etc. In the first group the exhibits were a 24 in. revolving beacon and a 180 deg. aerodrome floodlight. The revolving beacon, intended for mounting on the top of a hangar or steel tower to act as a guide to the pilot by indicating from a distance the location of the aerodrome, consists essentially of a cast aluminium barrel 24 in. in diameter containing a high grade silver glass "parabolic" mirror, a frame holding a plate glass front being hinged to the barrel and held in place by clamps. The barrel is supported in a crutch mounted on a vertical shaft carried on ball-bearings. This shaft is furnished with collector rings for supplying current to the lamp, and flashing mechanism which permits code signals to be given, various different flashes being obtained by the use of different cams in this gear. The shaft is rotated through worm-gear by a motor enclosed in a sheet metal casing attached to the base. Various speeds of rotation from one half to 6 r.p.m. are available.



Two of the lighting units shown by the British Thomson-Houston Co. Ltd. That on the right is a beacon light.

Where the beacon is not placed in a readily accessible position, an automatic lamp changer can be provided. In the event of lamp failure the changer automatically places a second lamp in focus so that the operation of the beacon is not interrupted. A beam candle power of approximately 2 000 000 is secured with a 1 000 W lamp.

The 180 deg. aerodrome floodlight is intended to illuminate aerodromes by the distributed method, a number of the units being installed along the boundary in sections controlled by separate switches, thus enabling the landing direction, according to the direction of the wind, to be indicated to the pilot. The unit consists essentially of a 180 deg. Fresnel lens, at the focal point of which the lamp is placed. A spherical mirror of silver glass fixed to the inside of the casing behind the lamp enables light which would otherwise be wasted, to be utilised. The focussing mechanism is provided to permit of the lamp being accurately centred.

In the second group of lighting equipment for ground illumination, the lighting of airplane sheds, hangars, etc., the B.T.-H. fittings included floodlight projectors and gas and watertight lanterns. Other exhibits of the same company included a very comprehensive range of aircraft magnetos, impulse starters, inertia starters, lighting generators, and similar equipment.

A newcomer at the exhibition was the firm of Messrs. Alfred Graham, well known in marine circles as manufacturers of telephones and other apparatus for use on board ship. Matters relating to aircraft equipment are under the control of Capt. D. Sinclair, and at the stand was shown aircraft radio apparatus as well as public speech and band repeater equipment for use on the ground. The equipment shown included medium and short wave aircraft equipment with and without direction finding apparatus and a portable battery-operated transmitter and receiver for lightships, survey work, etc. A special feature of this company's exhibit was the "Graham" light aeroplane equipment.

Direction Finders.

Radio apparatus was also shown by Marconi's Wireless Telegraph Co., Ltd., the latest of this company's transmitters being a Type T A I 4 kW set shown by the Air Ministry. A model of the Type R G 14 direction finding receiver was also shown on the same stand. In addition, on the Marconi stand, the aerodrome ground station transmitter, Type U, with a power of 1·5 kW and a waverange of 600 to 3 000 metres, was shown. Receiving equipments especially suitable for aerodrome working were the Type D F M 4 and R G 19 sets, displayed in conjunction with the transmitter. Another interesting set was the "all purpose" telephone-telegraph apparatus Type A D 6 H for use on civil, military and naval aircraft. It comprises a transmitter of 150 W and a receiver, and is suitable for the transmission and reception of telephone and telegraph messages to and from aerodrome ground stations up to distances of 100 to 300 miles. Where space is restricted and no operator or observer is carried, the set can be mounted in any part of the machine and operated by the pilot through a remote control unit. As in the case of all the Marconi aircraft sets, power is supplied by means of a windmill generator, which may also be used to provide current for lighting the aircraft at night. The power supply may be arranged so that in the event of a forced landing the generator may be operated by batteries or a light petrol engine to enable communication to be established with the nearest ground station. Other exhibits were the long range telegraph-telephone set Type A D 8, the short wave transmitter, Type A D 5, the A D 12 receiver, and a comprehensive range of d.f. apparatus. Of particular interest was a "light aeroplane" set, Type A D 22, which comprises a 75 W transmitter for telephone communication and a receiver, combined in one light case. Telephone transmission is possible over ranges up to 75-100 miles, the receiver being capable of receiving both telephony and telegraphy, either c.w. or interrupted c.w., when required. The set can be mounted in any convenient part of the machine and operated through a remote control unit by means of Bowden wires. (See page 149).

The Chloride Electrical Storage Co., Ltd., was another exhibitor, and on this company's stand was shown the "Keepalite" apparatus, a description of which has already been given in THE ELECTRICIAN. Other exhibits included a complete range of batteries specially designed for use by aircraft and for radio purposes. A picture of the "Exide" stand is given on page 147.

INSTITUTE OF METALS.

British Metallurgists to Visit Germany—First Congress Since 1914.

AN attractive programme has been drawn up in connection with the metallurgical congress to be held by the Institute of Metals in Düsseldorf from September 9th–12th. The gathering is the first of its kind to be held since the war, and takes place by invitation of the Verein Deutscher Ingenieure and the Deutsche Gesellschaft für Metallkunde. At the two business sessions of the Congress 14 technical papers will be presented for discussion. Following the meetings visits will be paid to works in Düsseldorf and neighbourhood, and to the Düsseldorf Foundry Exhibition; there will also be a whole-day excursion to the works of Messrs. Krupp at Essen. On the social side there will be a dinner and dance given by the Lord Mayor of Düsseldorf, also a cabaret evening at the Düsseldorf Artists' Club.

Following the Düsseldorf meeting supplementary visits will be paid on September 13th–15th, the first to Berlin and the second to Holland. The latter will be of a sightseeing character, but in Berlin visits will be paid to works as well as to the Technical High School at Charlottenburg and to the Government Testing Laboratory.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

ROCHFORD GUARDIANS, August 7th.—Underground cables, switchgear instruments, wiring, 25 H.P. motor, starting gear, etc. Specification, etc., from Mr. H. Tomlinson-Lee, 26, Victoria Street, Westminster, S.W.1; deposit £2 2s.

SALFORD CORPORATION, August 10th.—Low tension, paper insulated, lead covered and armoured cables. Forms of tender from the City Electrical Engineer.

LONDON COUNTY COUNCIL, August 12th.—Supply and installation of nine 1 000 kW rotary convertors, with static transformers. Specification, etc., from the General Manager, Tramways Offices, 23, Belvedere Road, London, S.E.1; deposit £1 1s.

UTTOXETER URBAN DISTRICT COUNCIL, August 12th.—Overhead 11 000 V transmission line; e.h.t. and l.t. cables and roadwork and public lighting; and sub-station equipment. Persons desiring to tender must notify Mr. W. C. C Hawtayne, 9, Queen Street Place, London, E.C.4.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., August 13th.—Supply of ironclad unit type switchgear, at the National Physical Laboratory, Teddington. Specifications, etc., from the Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1; deposit £1 1s.

CENTRAL ELECTRICITY BOARD, August 24th.—Supply, delivery, and erection of metering equipment for certain stations in the area of the South-East England Electricity Scheme, 1927. Specification No. S.E.E.—G.M.1, after August 6th, from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2. Deposit £2 2s. for first copy, £1 1s. for each subsequent copy.

NEWCASTLE ENDOWED SCHOOLS, August 24th.—Electric light installation in a new wing to be erected at each of two schools, viz.: Newcastle-under-Lyme High School, and Newcastle-under-Lyme Orme Girls' School. Specifications, etc., from Messrs. Cramp and Frith, 1, Dickinson Street, Manchester; deposit £3 3s. in respect of one contract, or £6 6s. in respect of both contracts. Tenders are invited only from firms on the National Register of Electrical Installation Contractors.

COMMITTEE OF VISITORS OF GLOUCESTERSHIRE MENTAL HOSPITALS, August 26th.—Electric wiring of Wotton and Coney Hill Mental Hospitals, on "Stannos" earthed concentric system. Specification, etc., from Messrs. Handcock and Dykes, 11, Victoria Street, Westminster, S.W.1; deposit £2 2s.

MANCHESTER CORPORATION, August 30th.—Supply and delivery of one water-tube boiler superheater for Barton power station. Continuous actual evaporation of boiler 130 000 lb. of water per hour. Specification, etc., from Mr. H. C. Lamb, chief engineer and manager, Electricity Department, Town Hall, Manchester.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—One 30 000 kW C.M.R. turbo-alternator and exciter, etc. Specifications from the Borough Electrical Engineer, 18-24, Lower Clapton Road, E.5, on and after July 30th; deposit £30.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—Fourteen 6 600 V, three-phase, metal clad, oil circuit breaker equipments, each not less than 1 000 000 V rupturing capacity; remote electrically-controlled, duplicate busbars; cabling and auxiliary gear controlling one 30 000 kW turbo-alternator, two 30 000 kVA transformers, two 15 000 kW reactance links, one 30 000 kVA busbar coupler equipment with and without reactance, and six 8 000 kW feeders. Specifications from the Borough Electrical Engineer, 18-24, Lower Clapton Road, E.5; deposit £3.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

YUGOSLAVIA.—Supply and delivery of two electric lifts for a local company. (Reference A.X. 8 315.)

INDIA STORES DEPARTMENT, SIMLA, August 5th.—For the supply and delivery of one 5 kW oil engine-driven, direct current, three-wire generating set, for the Military Engineering Service, Belgaum, Bombay Presidency. (Reference B.X. 5 517.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor, overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

NEW ZEALAND POSTS AND TELEGRAPHS, August 7th.—Enamelled and silk-covered resistance wire (No. P. and T 151/1 497). (Reference B.X. 5 322.)

THE stand of the Marconi's Wireless Telegraph Co., Ltd., at the International Aero Exhibition, which came to a close at Olympia last week. A brief description of some of the exhibits is given on the opposite page.

PORT ELIZABETH MUNICIPALITY, August 8th.—One 250 kVA, 3-phase, self-cooled type, indoor transformer (specification No. 30). (Reference B.X. 5 487.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 8th.—Telegraph material, including g.i. tubular side-arms, insulators, paper sleeves, insulator spindles, etc. (tender No. 161). (Reference A.X. 8 112.)

CHILEAN MINISTRY OF MARINE, August 9th (extension of time).—Supply and erection of two aerial towers for new wireless station at Arica. (Reference A. 8 244.)

ORADEA MORE MUNICIPALITY, BUCAREST, August 9th.—Supply and delivery, 400 single phase supply meters, 150 V, 42 cycles, 3 A; 200 single-phase supply meters, 150 V, 42 cycles, 5 A. (Reference B.X. 5 519.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, August 12th.—Supply and erection at Burrinjuck of auxiliary hydro-electric generating plant. (Reference B.X. 5 365.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 13th.—Supply of electric power plant, with underground and overhead network, for the town of Maghagha, Minieh Province, (Reference B.X. 5 318.)

MADRAS AND SOUTHERN MAHRATTA RAILWAY CO., LTD., August 13th.—Supply of 70 a.c. motors and starters, with spares, for Perambur works remodelling. Forms of tender (£1, not returnable) from the Company's Office, 25, Buckingham Palace Road, London, S.W.1.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th.—Water turbine driven generating sets and switchgear for Waitaki power development (section 2). (Reference B.X. 5 278.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply and erection of steam raising plant, engine, alternator and switchgear (contract A). (Reference A.X. 7 983.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 15th.—Supply of h.t. and l.t. cable, lamps and sundries, in connection with extensions of the electricity undertaking. (Reference B.X. 5 312.)

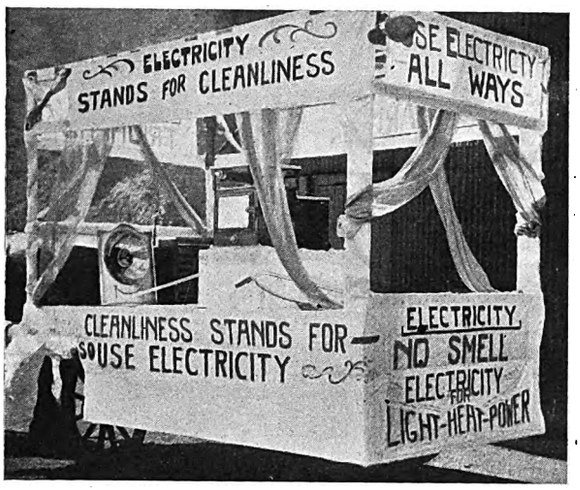
EGYPTIAN MINISTRY OF THE INTERIOR, August 15th.—Supply and erection of additional Diesel engine and alternator at Zagazig power station. (Reference B.X. 5 393.)

Digitized by Google

LOURENÇO MARQUES TREASURY DEPARTMENT, August 15th.—Supply and delivery of one electric motor and set of type for gilding books. (Reference B.X. 5 520.)

SOUTH AFRICAN RAILWAYS AND HARBOUR, August 15th.—Electrically-driven plate bending and flattening machine (tender No. 1 498). (Reference A.X. 8 164.)

CHILEAN STATE RAILWAYS, August 16th.—Material for overhead lines, underground cable and cable boxes (Group 41);



ONE of the special efforts to boost electricity in the Abertillery area. The wording on the vehicle read to the effect that though the horse pulling the exhibit served in the war, "electricity will serve you always." Mr. Dawson Thomas, the engineer and manager of the undertaking, points out that electricity has been advanced in this area by the hard work of the engineers attached to his department during the past twelve months, and it is anticipated that much good will result from the "spade-work" which is now being done.

and material for lighting of locomotives and carriages (Group 43). (Reference C. 3 069*.)

CHILEAN STATE RAILWAYS, August 16th.—Telegraph and telephone materials, including copper wire and cable, switches, table telephones (Ericsson type), telephone cords, etc. (Reference C. 3 072*.)

CHILEAN STATE RAILWAYS, August 16th.—Supply of instruments of staff or tablet type, for installation at 36 stations between Alameda and Talca, locking apparatus for switches, batteries and telephone combinations. (Specification C. 3 070*.)

URUGUAY POSTS, TELEGRAPHS AND TELEPHONES, August 17th.—Supply of telegraph wire. (Reference A.X. 8 229.)

AUCKLAND ELECTRIC POWER BOARD, August 19th.—Single-phase transformers. (Reference B.X. 5 324.)

INDIA STORE DEPARTMENT, SIMLA, August 20th.—Supply and delivery of one 80 kW, 2-wire, d.c. generating set for the Military Engineering Services, Razmak. (Reference B.X. 5 522.)

PORT ELIZABETH MUNICIPALITY, August 22nd.—One 10 000 kW turbo generator and condenser, boiler, steam and feed water pipes, etc. (Reference B.X. 5 430.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 22nd.—Extension magneto bells, bell sets, condensers, magneto generators, central battery switchboard tumbler switches, wall and table telephones, etc. (Reference B.X. 5 415.)

GREY ELECTRIC POWER BOARD, August 27th.—Supply and erection of generating plant, for the Arnold river hydro-electric scheme. (Reference B.X. 5 422.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, August 27th.—Supply of cord type switchboards (schedule C. 448). (Reference B.X. 5 428.)

OUDTSHOORN MUNICIPALITY, SOUTH AFRICA, September 3rd.—Supply and delivery of 35 kW steam-driven generating set together with the supply and delivery only of certain switchgear material. Reference B.X. 5 524.

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 7th.—Supply of v.i.r. wire. (No. P. and T. 151/1 573.) (Reference B.X. 5 416.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 10th.—Two-conductor cores (P. and T. 151/1 600). (Reference B.X. 5 462.)

LOURENCO MARQUES PORT AND RAILWAYS, September 11th.—Battery tractors and trailers. (Reference A.X. 8 172.)

BULAWAYO MUNICIPALITY, September 13th.—Supply of h.t. overhead transmission lines, stepdown transformers, pumps with motors, etc. (Reference A.X. 8 181.)

AUCKLAND (N.Z.) ELECTRIC POWER BOARD, September 16th.—Supply of automatic sub-station at Remuera (two 500 kW machines and switchgear); automatic sub-station at Point Chevalier (two 1 000 kW machines and switchgear); 22 000 V switchgear; 6 600 V switchgear, and supervisory control apparatus. (Reference B.X. 5 506.)

Tenders Accepted.

BODLEIAN LIBRARY, OXFORD.—Hill, Upton and Co., electric light installation.

HULL CORPORATION.—J. C. Coulchan, Ltd., electric light installation at Central Public Library.

GLASGOW CORPORATION.—Kennedy, Stark and Co., electric light installation at Dixon Halls, £421.

KENSINGTON (LONDON) BOROUGH COUNCIL.—Duncan, Watson and Co., rewiring Leighton House, £311 17s.

COLWYN BAY URBAN DISTRICT COUNCIL.—Macintosh Cable Co., Ltd., supply, laying, etc., of e.h.t. and l.t. cables.

SKELTON AND BROTTON URBAN DISTRICT COUNCIL.—Hewling, of Skelton, electric light installation at Hospital.

STOCKTON-ON-TEES CORPORATION.—Brush Electrical Engineering Co., Ltd., two 1 250 kVA three-phase transformers, and l.t. three-phase switchgear, £990.

MYTHOLMROYD URBAN DISTRICT COUNCIL.—J. Harrison and Co., electricians' work in connection with erection of eight houses on Caldene housing site, Ashton Road.

WEYMOUTH CORPORATION.—Hyde and Cowley, supply and fitting of all wiring and electrical work for Maternity and Child Welfare Centre and Public Health Office, £103.

MILNSBRIDGE PERSEVERANCE CO-OPERATIVE SOCIETY.—E. Rayner, electrician's work in connection with erection of four houses on Society's estate at Cowersley, £12.

WEST LANCASHIRE RURAL DISTRICT COUNCIL.—W. T. Henley's Telegraph Works Co., Ltd., works in connection with Aughton electricity scheme, £13 305 (Recommended).

DEPTFORD (LONDON) BOROUGH COUNCIL.—Alpha Manufacturing Co., Ltd., provision of electric cables, etc., in connection with extension of lighting at Laurie Grove baths, £197 (Recommended).

STOKE-ON-TRENT CORPORATION.—Mr. F. Holloway, Stoke, for overhead wiring and services to housing site: Victoria Road, £550; Shelton New Road (A), £9 18s.; Shelton New Road (B), £11; Marlborough Street, £66.

SHEFFIELD EDUCATION COMMITTEE.—Electric wiring and fitting at various council schools: Wilkinson, Bentley and Co., Firshill, Intake and Lowfield council schools, Electric Supply Dept., Carfield, Woodbourn, Woodseats and Woodside council schools.

CALNE CORPORATION.—Morement and Bridges, underground cables for the supply to the new school in Silver Street; also wiring municipal buildings, £85. For latter contract other tenders were: A. R. Fox, £82 15s; Gough Bros., £83 9s. 9d.; Ellis and Ward, £92 14s.

MANCHESTER CORPORATION.—Air-break circuit breakers, Allen West and Co., Ltd.; star delta switch starters, Crompton Parkinson, Ltd., and English Electric Co., Ltd.; alternating current motors, British Thomson-Houston Co., Ltd., Asea Electric Co., and Crompton Parkinson, Ltd.; potential and current transformers, Ferranti, Ltd.; electric kettles, Premier Electric Heaters, Ltd.; time switches, Venner Time Switches, Ltd., and Nathan and Allen, Ltd.; cables, Connollys (Blackley), Ltd., W. T. Henley's Telegraph Works Co., Ltd., Johnson and Phillips, Ltd., Macintosh Cable Co., Ltd., Standard Telephones and Cables, Ltd., Pirelli-General Cable Works, Ltd., W. T. H. Glover and Co., Ltd., Hackbridge Cable Co., Ltd., Callender's Cable and Construction Co., Ltd., Liverpool Electric Cable Co., Ltd., Edison Swan Cables, Ltd., Mersey Cable Works, Ltd., and Ward and Goldstone, Ltd; electricity meters, Ferranti, Ltd., Metropolitan-Vickers Electrical Co., Ltd., Edison Swan Electric Co., Ltd., and Measurement, Ltd.; neutral earthing resistance and switch, Whipp and Bourne, Ltd.; material and labour involved in extension of 33 000 V mains, Callender's Cable and Construction Co., Ltd.; installation of grit arrester at Stuart Street station, E. Green and Son, Ltd.; repairs to motor convertor, Bruce Peebles and Co., Ltd.

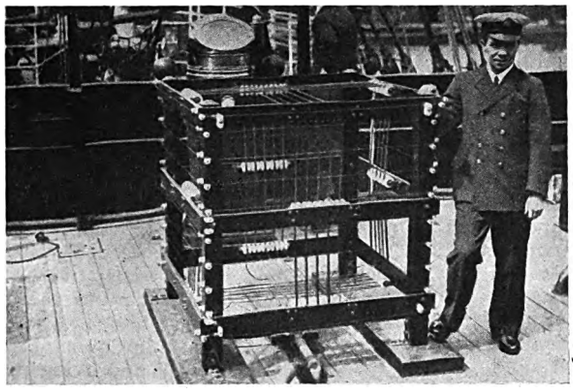
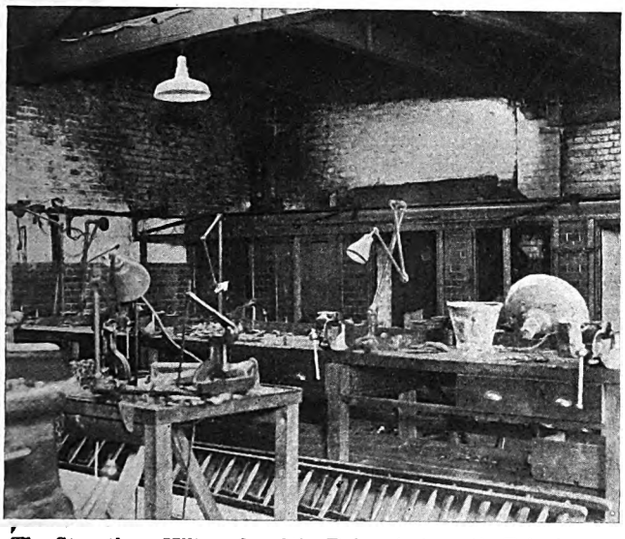
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

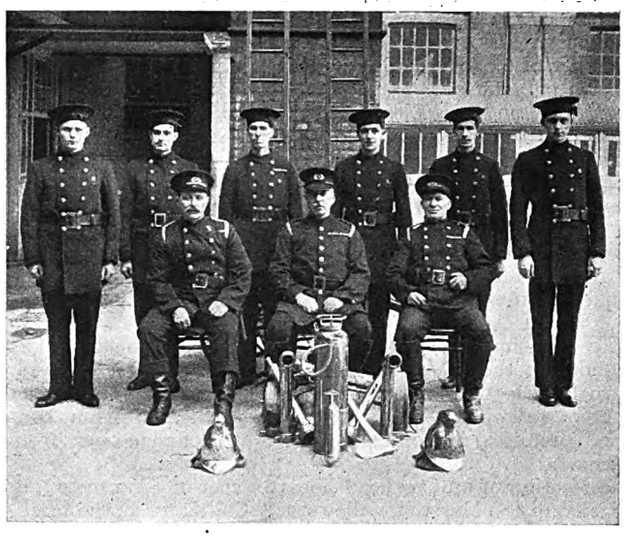
Mr. C. T. Briscoe, head of the firm of electrical contractors which bears his name, whose death is announced on page 144.



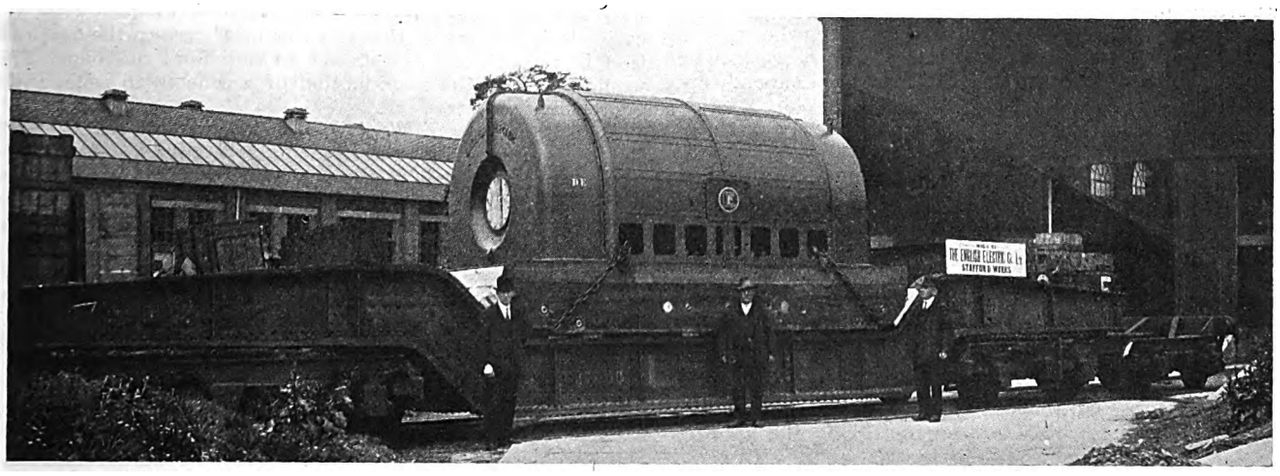
The wireless direction finding "aerial" on board the "Discovery," which leaves the East India Dock, London, next week, on her way to the Antarctic.

Mr. J. W. J. Townley, whose appointment to West Ham Electricity Department as successor to Mr. F. W. Purse, is announced on page 144.





The Streatham Hill works of the Relay Automatic Telephone Co., Ltd., were the scene of a fire on Monday, when the toolshop was badly damaged. The flames, which at times were 40 ft. high, destroyed all belting and would undoubtedly have done more damage but for the smart work of the company's fire brigade in checking the fire within 30 seconds. The shop was full of girls at the time but the absence of panic allowed everyone to make an escape. The damaged shop may be seen in the left-hand picture, while the "Relay" fire brigade is shown on the right.



This illustration shows what on the railway is regarded as an "exceptional load." This stator is 19 ft. 8 in. long, 9 ft. wide at base, and 9 ft. 6 in. high at the centre. It weighs 71 tons, and has an output of 31 250 kVA. Manufactured by the English Electric Company, the machine is here shown leaving the Stafford works loaded on an 80-ton trolley ready for transport by L.M.S. to the Leicester Corporation Central Power Station, where it will be coupled to the 25 000 kW, 3 000 r.p.m., two-cylinder steam turbine which has been built at the company's Rugby works. Special precautions were taken to ensure the safe travelling of the load, the train being limited as to speed, with frequent stops for examination, one of the railway company's inspectors being in charge throughout the journey.

ELECTRICITY SUPPLY.

Accrington and Unemployment—President Cosgrave and the Shannon Scheme—New Houses at Morden—New Feeder Mains for Sheffield—Overhead Lines and Birkenhead Corporation—The Grampian Electricity Scheme.

WEYMOUTH Electricity Committee is to extend mains at a cost of £1 400.

Sheffield Electricity Committee has obtained sanction to borrow £25 000 for feeder mains.

Warrington T.C. has applied for a Special Order to supply electricity to Warburton, Agden and High Leigh.

Derby Corporation is to apply for powers to supply electricity to Kirk Langley, Radbourne and Mackworth.

Portland Electricity Committee has obtained sanction to borrow £8 186 for mains and services and £1 278 for plant.

Oldham Corporation has obtained sanction to the borrowing of £70 000 for the construction of tie and interconnecting mains.

Ockbrook P.C. has accepted the terms of the Notts and Derbyshire Electric Power Co. for public lighting with 200 c.p. lamps.

Leeds Electricity Committee has accepted a tender amounting to £1 124 for the erection of a sub-station in Ebenezer Street.

Bexhill Electricity Committee is to extend mains, at an estimated cost of £2 754, to supply electricity to houses on the Pebsham estate.

Tynemouth Electricity Committee is to obtain tenders for the supply of 6 000 V cable required for taking current to the Ingleside sub-station.

Poplar (London) Electricity Committee has obtained sanction to borrow £4 773 for cable extensions at West India Docks and Wick Lane sub-stations.

Brighton Electricity Committee has now agreed upon the terms of the assisted wiring scheme and seeks sanction for a loan of £5 000 for its inauguration.

Grange-over-Sands U.D.C. has received sanction to a loan of £5 000 for electricity extensions, which will enable the Council to complete the mains to all parts of the district.

The South African Electricity Supply Commission is to erect a transmission line from the traction sub-station at Claremont to the Cape explosives works at Somerset Strand.

Barnsley Electricity Committee has voted £1 725 in respect of meters to replace 1 150 d.c. meters removed from consumers' premises, in connection with the change-over from d.c. to a.c.

The erection of an overhead line at a cost of £800 to supply electricity to the Marston Valley Brick Co., Ltd., at the brickworks now in course of erection at Lidlington, has been agreed to by Bedford Electricity Committee.

An application is to be made by the West Lancashire Rural District Council to the Electricity Commissioners for a Special Order covering the parishes of Tarleton, Hesketh-with-Becconsall, Rufford, Scarisbrick, Halsall, and North Meols.

Accrington Electricity Committee has decided to push forward with the change-over of its supply from d.c. to a.c. in order to provide work for men at the electricity works who might otherwise be dispensed with. The capital expenditure will amount to £42 000.

Authority for installing electricity services to 43 premises at a cost of £437, extensions of mains for private services at a cost of £875 and extensions of mains for public lighting and conversions of gas lamps at £931 has been granted by Battersea (London) Electricity Committee.

Rotherham Electricity Committee recommends that the price to be charged for the supply of electricity in connection with the working of automatic street signals be £50 per annum per set of four signals, including the supply of current and the maintenance of gear and lamps.

Fulham (London) Establishment Committee recommends the B.C. to authorise an expenditure of £78 15s. for the conversion of the electric lighting in the new part of the Town Hall building from 100 V to 200 V and for improving the lighting in the refreshment rooms, cloak rooms, etc.

Wantage R.D.C. has received an offer from the Wessex Electricity Co. to wire for four points, and supply fittings, etc., to about 78 Council houses, at about £4 per house. The Ministry of Health has offered to make a grant, if the tenants will agree to an increased rent to meet the cost.

On the occasion of the opening of the intake gates to the head race of the Shannon electric power undertaking at Parteen Villa, O'Brien Bridge, last week, President Cosgrave said it was probable that the supply of electric power throughout the Irish Free State would begin in the early part of next winter.

The necessary mains to meet the demand for supplies on the Gayton Park Estate are to be laid by Birkenhead Corporation. The Electricity Committee has decided to make application to the Ministry of Transport for compulsory wayleaves over land in connection with a supply to Burton and Puddington.

Hambledon R.D.C. has approved amended plans submitted by the Aldershot Gas, Water, and District Lighting Co. of a line of cables from Farnborough to Hindhead. The line will be partly overhead and partly underground, and on the amended route the cables will not be visible from the Devil's Punchbowl.

An Order-in-Council has been passed in the Canadian House of Commons approving the plans of the Chats Falls Power Co. for the development of electricity at Chats Falls, about 25 miles west of Ottawa, at an estimated cost of $2 500 000. The power house will be designed for two 15 000 H.P. units operating under a 37-ft. head.

The first section of the Grampian electricity scheme at Rannock is expected to be completed early next year. About 600 men are engaged on the tunnel between Loch Ericht and Loch Rannock, where the generating station is to have an initial capacity of 42 000 H.P., and another power station is to be erected at Loch Tummel.

The new administrative buildings and extensions to the boiler house at the Kilmarnock electricity station were opened recently by Sir Andrew Duncan, chairman of the Central Electricity Board, and Mr. Archibald Page, chief engineer to the Board. The premises include a showroom for apparatus and equipment for hiring out to consumers.

At Messrs. Lever Bros.' new dock at Bromborough, a large modern electricity generating station has been erected in an ideal situation in about the centre of the estate, and electricity can be supplied to meet any requirements of industry. Supplies are being taken by large industrial factories and the power station is being extended to meet further demands.

London County Council Housing Committee reports that it has decided that all the houses on the new St. Helier estate at Morden shall be lighted by electricity, and the necessary wiring for the first section has been arranged for at a cost of £31 500. The County of London Electric Supply Co. and the South Metropolitan Tramways and Lighting Co. are to lay the mains free of charge to the Council.

At a recent meeting of Londonderry Corporation, some members complained of a minimum charge of 7s. 6d. a quarter being made for electricity to poor people, even when no electric light had been consumed during the period. The Electrical Engineer said the minimum was adopted to deal with the early closing of offices, the object being to recoup the Corporation in respect of interest and sinking fund on loans. He would consider the introduction of a scheme to relieve the poorer householders.

A dispute between Woolwich T.C. and Erith U.D.C. as to the interpretation of an agreement for a supply of electricity to a large power user in the Erith District, has been settled by arbitration. The arbitrator, Mr. N. Micklem, K.C. decided that Erith Council should pay to Woolwich Corporation £2 759 2s. 8d. in addition to £12 407 12s. 9d. already paid, and a further sum of £360 14s. 4d., claimed as owing on the true construction of the price clause of the agreement, based on the agreement year ending April 25th, instead of the financial year ending March 21st, and that each party should pay its own costs, and half his fee (£54 15s. 6d.)

London County Council Mental Hospitals Committee is of opinion that steps should be taken to substitute an electric service for the gas lighting and heating now used at the Hanwell Mental Hospital. The cost of lighting, cooking and heating by means of gas produced at the hospital gas works was £3 460 for the year ended March, 1929, and the cost of electricity purchased from the Metropolitan Electric Supply Co., and the purchase of gas for cooking is estimated at £1 780 per annum, exclusive of debt charges. The committee recommends that an estimate of £23 000 expenditure on capital account, in respect of the electric lighting, etc., of the hospital be approved.

COMPANY NEWS.

Electrical Share Market Inactive—A Manufacturing Rumour—Dividends and Reports—The Young Accumulator Meeting—Einsteins Electro-Chemical Process—Metropolitan Railway Interim Dividend.

OWING to the inactivity of the market this week there have been no appreciable dealings in the electrical share market. Prices remain for the most part steady, quotations being much the same as those published last week.

AMERICAN ELECTRIC POWER Co.—Regular qrtrly. div. on pfd. stk. is announced.

POWER CORPORATION OF CANADA.—Directors declared 5% stk. div., payable Oct. 25.

ENFIELD CABLE WORKS, LTD.—Div. of 10% actual (2s. p. sh.) will be payable on Sept. 21.

CANADIAN MARCONI Co., LTD.—Rept. for year 1928 shows net pft. of $181 590, an incr. of $135 035 over 1927.

CITY OF BUENOS AYRES TRAMWAYS Co. (1904), LTD.—Div. of 1s. 3d. p. sh. for qrtr. ended June 30, 1929, will be payable on Aug. 16.

METROPOLITAN ELECTRIC SUPPLY Co., LTD.—Intm. div. at rate of 6% p. a. for half-year ended June 30, 1929, will be payable on Aug. 13.

IMPERIAL TRAMWAYS Co., LTD.—Intm. div. on ord. shs. for half-year ended June 30, 1929, at rate of 4% p.a., less tax, has been declared.

COMMONWEALTH POWER CORPORATION.—Div. of $1 p. sh. on common stk. and reg. qrtrly. div. of 1½% on 6% pfd. stk. paid on Aug. 1.

ALLIED POWER AND LIGHT CORPORATION.—Regular qrtrly. divs. of $1.25 p. sh. on $5 cum. 1st pfd. stk. and 75 cents p. sh. on $3 cum. pref. stk. will be payable on Aug. 15.

CHARING CROSS ELECTRICITY SUPPLY Co., LTD.—Intm. div. on ord. shs. of West End undertakings for half-year ended June 30, 1929, of 9½d. p. sh., less tax, has been declared.

W. H. DORMAN AND Co., LTD.—Rept. for year ended March 31 shows net pft. of £13 372, compared with £10 281 for 1927-28. Deb. bal. of £59 383 bt. in thus reduced to £46 011.

METROPOLITAN RAILWAY Co.—Intm. div. of 1¼ p.c. (same as last year) on ord. stk. for half-year ended June 30, 1929, and intm. div. of 1½% (same) on surplus lands stk. have been declared.

INTERNATIONAL HYDRO-ELECTRIC SYSTEM.—First qrtrly. div. on class "A" stk. in the form of stk. at rate of $\frac{1}{50}$ sh. for each sh. held or cash at rate of 50 cents for each $\frac{1}{50}$ sh. of stk. div. has been declared.

DUBLIN UNITED TRAMWAYS Co. (1896), LTD.—Div. at rate of 6% p.a. on pref. shs. for half-year to June 30, 1929, has been declared. Directors do not feel justified in declaring an intm. div. on ord. shs.

ASSOCIATED GAS AND ELECTRIC SYSTEM.—Net earngs. for year ended April 30, 1929, $23 818 643, increase $5 677 045. Gross earngs. $52 618 711, increase $11 718 449. Operatg. exes., maintenance, taxes, etc., $28 800 068, agst. $22 758 664. Gross surplus, $7 848 634, agst. $6 257 795.

CITY OF LONDON ELECTRIC LIGHTING Co., LTD.—The following divs. for half-year ended June 30, 1929, have been declared: 7·2d. p. sh. (at rate of 6% p.a.) on 6% 1st pref. shs.; 9·6d. p. sh. (at rate of 8% p.a.) on 2nd pref. shs.; 1s. p. sh. (at rate of 10% p.a.) on ord. shs.; all payable, subject to deductn. of tax, on Sept. 30.

BABCOCK AND WILCOX, LTD.—It is reported that a group including Messrs. Babcock and Wilcox, the Banco de Vizcaya, and the General Electric Co., as well as several Spanish electrical enterprises, will establish a company at Bilbao with a capital of 10 000 000 pesetas, for the manufacture of material used in the electrical industry.

EAST KOOTENAY POWER Co.—Gross revs. for year ended March 31, 1929, $498 755, agst. $422 586. Net earngs. $86 101, agst. $65 580. After provisn. for pfd. divs. blce. applicable to common stk. was $16 101, agst. $4 330, plus previous surplus $16 225. After mtg. all charges, div. earngs. on 30 000 shs. of common stk. are equal to 54 cents p. sh.

MEXICAN LIGHT AND POWER Co., LTD.—Rev. for 1928, $4 729 570, agst. $4 566 838. Deductg. gen. exes., int. on bonds ($2 459 726), and placing $974 086 to sinkg. funds, blce. is $1 164 132, agst. $1 264 321. Two half-yearly divs. in respect of 1928 have been paid on 7% pref. shs. and 4% 2nd pref. shs. Fwd. $1 456 453, agst. $940 321. There was an improvement in the exchange situation during the year.

MEXICO TRAMWAYS Co., LTD.—Earngs. during 1928 show little improvement over previous year, in consequence of jitney and omnibus competitn. and general business depression. Consolidated rev. and expenditure acct. shows credit of $2 071 400, agst. $1 563 679. After mtg. gen. exes. and paying fixed charges, blce. is $995 445, agst. $601 997, which is set aside towards mtg. necessary cap. expenditure for improving and developing system.

AMERICAN AND FOREIGN POWER Co.—Net earngs. of controlled subsidiaries for 1928, $15 594 315, agst. $10 530 526. Blce. available for common stk. after deductg. all charges, $1 528 900, agst. $856 364. Surplus at $8 816 972 showed increase of $4 900 710. Qrtrly. divs. of $1·75 and $1·50 respectively have been declared on $7 and $6 prfd. stks., payable July 1. An increase in investmts. amtg. to over $177 000 000 is reported. Total investmts. at Dec. 31, 1928, $285 565 840, agst. $108 186 628.

NORTH AMERICAN Co.—During year end. March 31, 1929, assets increased from $733 998 905 to $861 416 955. Property and plant increased in valuation from $620 384 338 to $733 331 773. Investments, $45 211 173, decreased from $46 744 829; current and workg. assets $62 581,730, agst. $46 823 661. Provision for reserve stands at $108 581 724, agst. $82 713 156. Capital surplus and undivided pfts. amount to $103 496 216. Current and accrued liabilities are $11 428 163 and $16 353 120, agst. $13 689 601 and $13 278 593.

MIDDLE WEST UTILITIES Co.—The board proposes to offer stckhldrs. rights to subscribe for additnl. common stk. on basis of one new share at $200 for every four shs. of all classes held. The common stk. will be split ten for one, the co. proposg. to retire its funded debt, to call in its Prior Lien bonds and pfd. stks. and to offer hldrs. of the latter rights to purchase about $55 000 000 of new 6% pfd. stk. carrying common stk. purchase warrants. The split-up common will receive stk. divs. at annual rate of 8%. On the readjustment the capital will consist of 550 000 shs. of $6 pfd. and 13 445 000 shs. of common stk.

TELEFONAKTIEBOLAGET L. M. ERICSSON.—This co., which recently published an excellt. annual rpt. of its Mexican branch, now reports favourable results of last year's activities of its affiliated concessn. cos. in Poland and Italy. In Poland telephone subscribers during 1928 increased by about 14% or from 60 635 to 68 917, while in Italy the number of subscribers rose by 10%, or from 21 566 to 23 795. Net pft. of Polish branch increased from 1·05 to 1·59 million kronor (£60 000 to £90 000), and div. was raised from 8% to 10%. Net surplus of Italian affiliatn. rose from 3·07 to 4·08 million lire (£9 000 to £12 000) and div. was 7%, agst. 6½% in previous year.

EAST AFRICAN POWER AND LIGHTING Co.—Pft. for 1928, shs1 129 719, includg. shs30 966 brt. in. After provisn. for pref. div., depreciatn., writing down exes. in connectn. with issues of cap., survey exes., div. of 6½% on ord. shs., etc., carry fwd. is shs33 914. In Nairobi area demand continues to expand. Increase is spread over all classes of consumers with exceptn. of sisal industry, where there was slight reductn. Developmt. of further hydro-electric works to augment supply for Nairobi area has been delayed by prolonged negotiatns. with Government, which are still in progress, and duplicatn. of main transmissn. line supplying Nairobi is nearing completn. Progress in Mombasa has been satisfactory. Considerable extensions to Kilindini Harbour are in hand, and a fourth oil-engine set has been purchased and was put into commissn. in April last.

Company Meetings.

WILLIAM BEARDMORE AND Co., LTD.—At a meeting on Monday, in London, holders of the eight per cent. seven-year notes unanimously adopted an amended scheme of reorganisation, after it had been decided to increase the dividend rate on the new second preference shares. Under the original scheme of 1928 holders of the notes were to have received £107 10s. of five per cent. "B" or second income debenture stock in respect of each £100 of notes held. The

Digitized by Google

amended proposals submitted on Monday gave the noteholders £108 of six per cent. second preference shares for each £100 of notes. Following the seconding of the resolution authorising the scheme, it was proposed that the rate of dividend on the second preference shares to be issued to the noteholders and others be increased to 7½%, and this proposal was adopted.

BRITISH POWER AND LIGHT CORPORATION (1929), LTD.—The statutory meeting of this company was held, in London, on Monday. Captain C. E. Benson presiding. The chairman said: You will notice by the statutory report that all the payments due to the corporation in respect of shares subscribed for cash have been made, and also that the shares to be issued in satisfaction of purchase price of shares acquired in the various companies which we control have been issued, and the purchases completed. In the balance-sheet, including the statutory report, the expenditure on preliminary expenses is not shown, but since the date of that report the various sums due have been finally ascertained, and amount to less than the estimate given of £11 000; this is very little more than one-half of 1% on the total authorised capital of your company. The period which has elapsed since the formation of the company has been occupied principally in consolidating the management and operation of the various subsidiary companies. The statutory report was unanimously approved.

YOUNG ACCUMULATOR COMPANY (1929), LTD.—The statutory meeting of this company was held, in London, on Monday. Mr. E. H. F. Reeves (the chairman) said the work of equipping the company's new factory at Malden was well advanced, and they were actually carrying on part of their manufacture there at the present time. It was anticipated that in the course of next month the existing small factory at Fulham would be practically closed down, the whole of the plant and the offices of the company being transferred to the new works. Shareholders would recollect that in the prospectus the sum of £20 000 was mentioned as the estimate for the equipment of the new factory. The directors were glad to be able to state that the total cost would be well below this figure. They claimed that the company's accumulator was the most efficient on the market. They had recently secured a licence for the manufacture and use of the Wilderman Separator. The use of this separator had many important advantages, and still further improved the efficiency of the accumulators.

The management had now got together their sales organisation and were actively engaged in appointing additional agents both in this country and abroad. Since the formation of the company many new accounts had been opened. There was a very large demand for storage batteries of all descriptions, and, owing to the special feature of the company's products, they felt sure that when the factory was in full working order, and the company was running its plant to its utmost capacity, they would obtain a large proportion of this business. The chairman then read a letter from Bentley Motors, Ltd., in the course of which they stated that all the cars entered by them in the Le Mans twenty-four hour race, the Brooklands Double twelve-hour race, and also in the Dublin motor race were fitted with Young accumulators, which stood up to the tests in a satisfactory manner. In conclusion, the chairman said that, after the end of August, the directors would be glad to welcome any shareholder who would care to visit the company's works on the Kingston by-pass road. The appointment of Capt. R. F. H. Norman as a director of the company having been approved, the proceedings terminated.

EINSTEINS ELECTRO-CHEMICAL PROCESS, LTD.—An extraordinary meeting was held in London on Tuesday, for the purpose of passing a resolution to increase the capital of the company by the creation of 520 000 Ordinary shares of 4s. each, which were to be issued as fully paid, for the purpose of acquiring the Pigache process.

Colonel the Master of Sempill, who presided, said: The progress of your factory at Slough is satisfactory, and in connection with this progress I would like to record the directors' satisfaction with the admirable services they have received from the engineering firm of Perrins', Ltd., of Astor House. The directors feel that the services of that firm are responsible in no small measure for the satisfactory progress that has been made. Negotiations are proceeding satisfactorily for the sale of licenses. The Pigache process undoubtedly has considerable possibilities, not only in so far as it applies to the Einstein process, but in a variety of different directions. After questions asked by shareholders had been answered, the resolution was duly carried.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BROWNE, Mr. J. D., 34, Inverness Avenue, Westcliff-on-Sea, wireless factor. £16 8s. 8d. June 12th.

BROWNING Thomas Edwin (trading as PREMIER RADIO ELECTRICAL CO.), 184, Railway Approach, Shepherds Bush, wireless dealer. £16 14s. 5d. May 28th.

CENTRAL RADIO CO., Britannia Buildings, Fenwick Street, Liverpool, radio dealers. £23 3s. 9d. June 22nd.

ECONOMIC WIRELESS CO., 46, Barker Street, Oldham, wireless dealers. £13 3s. 8d. June 25th.

MARKS, Bernard, 85, Dartmouth Road, N.W., electrical contractor. £31 18s. 8d. June 17th.

POWELL, Hector B., 6, Chandos Street, Hereford, wireless dealer. £12 16s. May 31st.

SOUTHERN ELECTRICAL CO., 317, Coldharbour Lane, Brixton. £16 3s. 4d. June 7th.

WILMINGTON RADIO CO., 58, Birchwood Road, Wilmington, wireless merchants. £14 os. 11d. May 1st.

Deeds of Arrangement.

GREAVES, John, rear of 11, Moon Street, South Shore, and 69, St. Heliers Road, Blackpool, electrical engineer and contractor. Dated July 18th, filed July 23rd. Trustee, J. Todd, 18, Birley Street, Blackpool, C.A. Secured creditors, £1; liabilities unsecured, £349; assets, less secured claims, £180.

KINCHIN, Magnus, trading as LEWIS ELECTRIC SEDAN CO., 72, Eastbank Street, Southport, electrical engineer. Dated July 23rd, filed July 29th. Trustee, W. G. Lithgow, 429A, Lord Street, Southport, accountant. Liabilities unsecured, £864; assets, less secured claims, £430.

Receivership.

DOREE, LTD. R. A. M. Pater, of 3, Warren Avenue, Bromley, Kent, was appointed receiver on July 12th, under powers contained in debenture dated June 17th, 1929.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

HUGHES (ALFRED H.) AND CO., LTD., Old Whittington, electricians. Registered July 17th, £1 000 debenture, to A. H. Spalton, 25, Wellington Street, Sheffield, electrical factor; general charge.

MEXICAN HYDRO-ELECTRIC DEVELOPMENT SYNDICATE, LTD., London, E.C. Registered July 20th, £250 debentures, part of £6 000 and 100% premium; general charge. *£4 450. December 31st, 1928.

Satisfactions.

LOOE ELECTRICITY CO., LTD., London, S.W.—Satisfaction registered July 12th, all moneys, etc., registered February 25th, 1927.

RADIO SERVICE (LONDON), LTD. Satisfaction registered July 16th, £1 500, registered August 29th, 1927.

SIMMONDS AND STOKES, LTD., London, W.C., electricians. Satisfaction registered July 17th, £3 000, balance of amount registered April 17th, 1924.

VIOZONE, LTD., London, W.C., electrical engineers.—Satisfaction registered July 11th, £148 4s. 5d., registered May 13th, 1929.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

STEVAL, LTD., 133, Oxford Street, London, W., wireless dealers, etc. A meeting of creditors was held on July 25th at the offices of Gray, Stainforth and Co., 31, Lombard Street, E.C., when it was reported by the solicitor to the company that there had been a meeting about three weeks previously when some of the principal creditors attended. Accounts were submitted to them, and it was decided ultimately to invite all the creditors to a meeting in order

Digitized by Google

that the position could be fully discussed. The accountant said that the figures he had presented at the previous meeting were from a balance sheet dated June 11th last. At that time, there was cash at the bank and in hand amounting to £108, debtors on hire purchase agreements totalled £16 971, but against that figure there were secured creditors for something like £12 000, other debtors totalled £239 and bills payable amounted to £79. The stock was valued at £1 573 and fixtures and fittings, etc., at £249. Against that the unsecured creditors amounted to £4 796 and there were preferential creditors totalling £323. On the face value of those figures, there was a surplus, so far as the creditors were concerned, but the accountant pointed out that the creditors would have to remember that as regarded the hire purchase accounts, in some instances, the payments were spread over a period of four years, and, in the majority of cases, they ran from 12 to 15 months. In addition to that there would be the cost of collection, which would come to quite a substantial figure if the creditors collected the debts themselves.

Answering Mr. E. Judd, of Corfield's Traders Association, who represented the Ever-Ready Co., the accountant said that the Ever-Ready Co., who were large creditors on the estate, were not invited to the first meeting of the creditors, because at that time the amount was not due to be paid, and the accountant had no idea that the Ever-Ready Co. were creditors. Answering further questions put by Mr. Judd, the accountant stated that the company was registered in February, 1928, with a capital of £1 000 and at the present time there were calls in arrear amounting to £133. The trading for the three months to April 30th, 1928, shows sales £1 746, and purchases £1 123. For the next nine months down to January 31st, 1929, the sales were £11 410, and the purchases £5 012, while for the last three months the sales were between £10 000 and £12 000. There were two directors of the company and they each drew £8 a week.

A circular had been previously sent out to all the creditors by Penman, Johnson and Ewins, solicitors, of Watford, which stated that the affairs of the company had recently been considered by an informal committee of some of the largest creditors, and it was unanimously agreed that a forced liquidation would not benefit anyone, as the favourable realisation of the hire purchase instalments would require the existence of an organisation for service in collection, whilst the liquidator would probably be unable to make any distribution amongst the creditors until the result of the collection became known, which would not be for at least 18 months. Shortly after the committee met, the company ceased trading, and Mr. F. S. Wilks was appointed receiver for the debenture holders. The chief creditors had also suggested that a gentleman who was contingently liable under guarantees to certain of the finance houses, should consider offering an immediate cash composition to the other creditors to avoid a delay which would be involved by any other arrangement. In the circular it was stated that the gentleman in question was prepared to purchase all the unsecured trade debts owing by the company for a sum equal to 6s. 8d. in the £, on the amount of such debts. That offer was subject to acceptance by first post on Saturday, July 27th, and it gave the guarantor the right to withdraw that offer if acceptances up to 95% of the total value of the unsecured debts (other than those having a preferential claim) were not received by that date. That provisional offer had already been accepted by Messrs. Bullmores, Ltd., the Dorian Wireless Co., Ltd., the Halcyon Wireless Co., Ltd., and the St. John Manufacturing Co., whose debts together exceeded £2 500, and those creditors recommended the acceptance of the 6s. 8d. to the general body of creditors.

At the meeting held on July 25th the creditors present were of opinion that sufficient time had not been given for them to agree to the acceptance. They also suggested that the percentage should be reduced.

London Gazette, etc.

Companies Winding-up Voluntarily.

CHIRK ELECTRICITY SUPPLY CO., LTD. By Special Resolutions, July 1st, confirmed July 17th. To sell the undertaking to the Electricity Distribution of North Wales and District, Ltd.; and W. G. Lloyd, of 8, West View, Rhosywaen, Chirk, appointed as liquidator, for the purposes of such winding-up.

COMMUNITY RADIO, LTD. By special resolution, June 24th, confirmed July 10th. That a liquidator be appointed, and that the liquidator enter into an agreement for sale of the going concern to Community Radio (1928), Ltd. on terms to be agreed.

J. R. JENNENS, LTD. By reason of its liabilities, July 18th. J. W. Blackham, 147, Corporation Street, Birmingham, Incorporated Accountant, appointed as liquidator.

SOUTHEND RADIO AND GRAMOPHONE CO., LTD. By reason of its liabilities, July 12th. T. L. Summers, 64, Victoria Street, London, S.W.1, appointed as liquidator.

Bankruptcy Information.

MARSH, Basil, 17, Victoria Road, Brighton, Sussex, electrician. Receiving order, July 20th. Debtor's petition. First meeting, August 7th, 12.30 p.m., Official Receiver's Offices, 12A, Marlborough Place, Brighton. Public examination, August 21st, 11 a.m., Court House, Church Street, Brighton.

Notice of Intended Dividend.

LAURENS, William Hamilton, 492, Prescot Road, Old Swan, Liverpool, radio engineer. Last day for receiving proofs, August 14th. Trustee, J. Allcorn, Government Buildings, Victoria Street, Liverpool.

Bankruptcy Proceedings.

BAINES, Gerald Talbot, 66, High Street, Gorleston, Suffolk, electrical engineer. The first meeting of creditors was held on July 27th at the Official Receiver's Office, 9, Queen Street Chambers, Norwich, when a statement of affairs was filed showing liabilities of £350 against assets of £55, thus leaving a deficiency of £295. The debtor stated that he commenced trading on his own account in July, 1925, and carried on for one year. For the next two years he did no work owing to an accident which he sustained to his leg. He recommenced trading again in March, 1928, with £40 capital he had borrowed. He had only kept a memorandum book containing customers' accounts for work done. The matter remained in the hands of the Official Receiver as trustee of the estate.

TEMPEST, Colonel, 4, Manns Court, Bradford, Yorkshire, electrician. The first meeting of creditors of this debtor was held on July 26th at the Official Receiver's Office, 12, Duke Street, Bradford, when the debtor attributed his failure to loss through bad debts, loss of contracts, and decline in trade owing to the depression in the textile industry, his contracts being formerly obtained mainly with manufacturers. He returned a statement of affairs showing ranking liabilities of £1 382, and there was a deficiency of £985.

WARNES, Elizabeth Ann, 10, Crescent Gate, Wilmslow Road, Rusholme, Manchester, electrical and radio engineer. The receiving order was made on June 10th, and according to the statement of affairs there are liabilities ranking at £1 158, against assets estimated at £524. From that has to be deducted preferential claims of £60, leaving net assets of £464, or a deficiency of £694. The debtor attributed her failure to competition, bad trade, and losses in connection with an agency. It would seem that in 1925 the debtor became entitled to the whole of her late husband's estate, valued at £3 667, and in the following year she financed her eldest son in the manufacture of wireless coils, but early in 1927 she paid his creditors 10s. in the £, involving a total loss of £1 000 in this business. In January, 1927, she leased a shop at Crescent Gate for seven years at £150 a year, and opened an electrical and radio engineering business which was entirely managed by her eldest son and his brother, who had experience in wireless work. She contributed £500 as commencing capital, but periodically since then she has realised all her shares and property to provide further capital, and also borrowed £300 from relations. The business, according to a rough account prepared to June, 1928, showed a loss of £600. She advanced £200 to a firm of patent electrical plug makers in order to obtain a sole selling agency but the plugs were never marketed owing to an alleged infringement. The dwelling house at Manchester was left to her by her husband and was sold in 1925 for £1 200, and another was purchased for £1 300, but was sold nine months ago for £1 450, which amount was used in repayment of the mortgage £750 and in the business. The debtor has kept a cash book and purchase and sales ledgers, and states she became aware of her position in January, 1929. The following are creditors: Brandes, Ltd., Sidcup, £44; Cossor, A. C., Ltd., London, £60; Downes and Davies, Liverpool, £27; Electrical Components, Ltd., Birmingham, £40; Hirst, Ibbotson and Taylor, Ltd., Manchester, £83; Mullard Wireless Service Co., Ltd., London, £53; Macintosh Cable Co., Ltd., London, £48; Philips Lamps, Ltd., London, £43; Sharratt Electrical Co., Ltd., Manchester, £30; White, J. C., and Co., Ltd., Manchester, £72.

WILMINGTON, Granville, 75, Railway Street, Nelson, Lancs, electrical and radio engineer. The public examination of this debtor was held last week at the County Court House, Bankhouse Street, Burnley, when a statement of affairs was produced showing ranking liabilities of £613 against assets estimated to produce £301. thus leaving a deficiency of £312. It appeared that the debtor commenced trading in 1923 at a stall in the Market Hall, Nelson. He had a capital of £50 borrowed from his mother. He carried on business until June, 1925, when he disposed of the stock and fittings and discharged all his liabilities with the exception of the £50 owing to his mother. In April, 1928, he borrowed a further £50 from his mother and recommenced trading at a lock-up shop, 75, Railway Street, Nelson. He had been successful for the first four weeks, but owing to a cotton dispute in the district from May to September of last year, his turnover was seriously affected. He stated that he became aware of his position in January of this year, and attributed his failure to the fire in his shop in December, 1928, when stock and fittings of the value of £120 were destroyed. While he received £120 from the insurance company, he had suffered a further loss through being unable to share in the ensuing Christmas and New Year trade. The examination was adjourned with a view to closing.

READ, Roland Arthur, electrical engineer, 9, The Pavement, Middle Lane, Crouch End, London, N. Under a receiving order recently made against the estate of this debtor the statutory first meeting of his creditors was held on Monday at Bankruptcy Buildings, Carey Street, W.C. Mr. F. Vyvyan (Official Receiver) presided. The debtor had stated in preliminary examination that he started business in September, 1926, with £50 borrowed capital, dealing in wireless goods and carrying out electrical installations. The immediate cause of his failure was the issue of a writ by the landlord in respect of a former residence, and owing to pressure by wholesalers the debtor filed his petition. He estimated his liabilities at £800 and valued his assets at about £350. In addition to the stock there were a number of accumulators belonging to customers left for charging and other goods on sale or return.

The estate was left in the hands of the Official Receiver.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

312 209 W. E. Beatty (Bell Telephone Laboratories, Inc.). Cable telegraphy. (21/2/28.)
285 824 I.G. Farbenindustrie Akt.-Ges. Electrolytic production of metals, and apparatus therefor. (21/2/27.)
312 384 W. H. Sayers and Electramonic Co., Ltd. Controlling means for sound-reproducing apparatus. (22/2/28.)
312 217 J. A. Kuyser and Associated Electrical Industries, Ltd. Dynamo-electric machines. (22/2/28.)
312 395 Electro Bleach and By-Products, Ltd., J. Hollins and D. Jepson. Electrodeposition of metals. (25/2/28.)
312 396 J. R. P. Lunn. Alternating-current voltage regulators. (27/2/28.)
312 398 E. L. Stubbings. Electric insulators. (27/2/28.)
293 294 Associated Telephone and Telegraph Co. Telephone systems. (2/7/27.)
312 416 General Electric Co., Ltd., and H. J. Coates. Protection of electric systems. (6/3/28.)
312 417 S. Z. de Ferranti and Ferranti, Ltd. Electrical transformers. (6/3/28.)
312 418 S. Z. de Ferranti and Ferranti, Ltd. Electrical circuit-breakers. (6/3/28.)
287 098 E. Harsanyi. Production of electric radiating-elements, particularly electron-emitting elements for electric discharge devices. (14/3/27.)
289 042 Compagnie Lorraine de Charbons Pour L'Electricite. Manufacture of arc-lamp electrodes. (21/4/27.)
312 430 W. Henderson and Telford, Grier, and Mackay, Ltd. Electric connection-boxes for cargo clusters, portable lamps, and such like. (21/3/28.)
312 432 I. H. Parsons and A. E. J. Ball. Electrical step-by-step mechanisms. (22/3/28.)
312 436 W. Wadsworth and Sons, Ltd., and A. A. G. Jensen. Electromagnets. (24/3/28.)
312 442 A. Shaw, S. H. Long, and Siemens Bros. and Co., Ltd. Wireless telegraph and telephone receiving apparatus. (29/3/28.)
312 443 Dunlop Rubber Co., Ltd., and E. W. Madge. Deodorising of articles produced by the electrophoresis of latex mixings. (29/3/28.)
312 444 Gramophone Co., Ltd., A. Whitaker, and W. H. Eccles. Piezo-electric devices. (29/3/28.)
318 448 T. Freer-Ash. Electrical transformer tanks. (4/4/28.)
312 450 C. T. Nicol. System of tuning wireless receiving sets and multi-contact switch therefor. (5/4/28.)
312 456 Edison Swan Electric Co., Ltd., and F. Shergold. Electric switches. (17/4/28.)
312 461 T. W. John. Electric wall-plugs. (24/4/28.)
299 761 Felten and Guilleaume Carlswerk Akt.-Ges. Electric submarine cables. (31/10/27.)
312 479 H. Baron (Compagnie Lorraine de Charbons pour l'Electricite). Electric couplings. (12/5/28.)
312 494 W. T. Henley's Telegraph Works Co., Ltd., and P. Dunsheath. Joints of electric cables. (25/5/28.)
312 495 British Insulated Cables, Ltd., and W. Holttum. Joints of electric cables. (25/5/28.)
312 507 Kelvin, Bottomley and Baird, Ltd., and F. A. King. High-frequency electrodes. (11/6/28.)
312 508 General Electric Co., Ltd., and E. M. Eden. Apparatus for controlling mechanism by means of light. (12/6/28.)
292 916 C. Lorenz Akt.-Ges. Wireless communication and remote control systems. (25/6/27.)
312 514 U. F. L. Steindorff. Portable electric lamps. (22/6/28.)
312 522 Eversheds and Vignoles, Ltd., and C. Midworth. Index-locking devices for electrical measuring instruments. (26/6/28.)
294 112 International General Electric Co., Inc. Cooling of dynamo-electric machines. (16/7/27.)
294 147 British Thomson-Houston Co., Ltd. Apparatus for the inter-conversion of mechanical and electrical oscillations such as loud-speakers. (18/7/27.)
299 032 Steatit-Magnesia Akt.-Ges. Electric insulators. (20/10/27.)
294 180 G. Somajni. Electric motor control systems. (19/7/27.)
294 615 Associated Electrical Industries, Ltd. Protective apparatus for electrical distribution systems. (27/7/27.)
312 544 J. Baxter. Electrically illuminated manœuvre-indicators for use on road vehicles. (31/7/28.)
295 037 British Thomson-Houston Co., Ltd. Electric switches. (4/8/27.)
296 303 International General Electric Co., Inc. Electrical determination of irregularities in the structure of massive metal bodies. (27/8/27.)
312 560 J. L. Baird and Television, Ltd. Television apparatus. (30/11/27.)
299 778 G. Fischer. Current-collectors for electric vehicles. (31/10/27.)
300 121 Siemens and Halske Akt.-Ges. Telephone systems. (5/11/27.)
301 745 British Thomson-Houston Co., Ltd. Electric discharge devices. (2/12/27.)
302 181 Marconi's Wireless Telegraph Co., Ltd. Radio and the like signalling systems. (9/12/27.)
302 602 A. Koulikoff and C. Chilowsky. Method and apparatus for the measurement of distances by means of electromagnetic waves. (15/12/27.)
303 178 L. Thurm. Television and like receiving apparatus. (30/12/27.)
303 180 Standard Telephones and Cables, Ltd. Filter circuit arrangements comprising piezo crystals. (29/12/27.)
306 837 West Manufacturing Co. Test-sets for locating faults in electric transmission lines. (5/7/27.)
312 259 G. V. Lomonossoff and P. Kapitza. Electromagnets. (20/12/27.)
312 403 Electro Bleach and By-Products, Ltd., J. Hollins, and D. Jepson. Electrodeposition of metals. (25/2/28.)
295 368 Allmanna Svenska Elektriska Aktiebolaget. Electric rotary converters. (12/8/27.)
285 478 Siemens-Schuckertwerke Akt.-Ges. Coupling of two alternating-current mains of different frequencies. (18/2/27.)
312 658 J. H. Buchanan and Associated Electrical Industries, Ltd. Magnetic cores for electromagnetic devices. (24/2/28.)
312 591 W. D. Verschoyle. Electric lamps for the production of ultra-violet rays. (25/2/28.)
312 616 English Electric Co., Ltd. and J. C. Wilson. Excitation of dynamo-electric machines. (27/2/28.)

THE LEAD MARKET.

The market was quiet last week, and, according to James Forster and Co., the highest prices paid were on Monday at £22 16s. 3d. for July and £22 17s. 6d. for October, and lowest on Wednesday at £22 10s. and £22 12s. 6d. respectively. The American price remains unchanged at 6.75 cents.

Closing prices on July 25th were £22 12s. 6d. for July and August, £22 13s. 9d. for September, and £22 15s. for October, 1s. 3d. per ton lower on the week.

COMING EVENTS.

Saturday, August 3rd—Monday, August 12th.

Institution of Electrical Engineers (Students' Section).—Summer tour, Paris and Northern France.

Tuesday, August 6th.

Electrical Contractors' Association (Derby Branch).—Ordinary meeting 5 *p.m.*

Wednesday, August 7th.

Electrical Contractors' Association (Bath Sub-Branch).—Ordinary meeting.
Electrical Contractors' Association (Cardiff Branch).—Ordinary meeting. 2.30 *p.m.*

Thursday, August 8th.

Electrical Contractors' Association (East Yorks Branch).—Metropole Hall, Hull. Ordinary meeting.
Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.
Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting. Corridor Chambers. 2.30 *p.m.*

Electric Vehicle Possibilities.

OUR belief that there is a big future for electric battery road vehicles has often been expressed in these columns, and of its truth there can be no question if only the electrical industry will take the matter up in a vigorous way and "push" electric battery traction for the applications to which it is—in its present phase of development—best suited. Although but a small proportion of the industry is directly interested in the development of this form of road transport it is possible for all to help it along. As providers of a useful off-peak load for power stations electric vehicles naturally deserve encouragement from station engineers, but other sections of the industry can help too. All electricity undertakings, without exception, should use commercial electric vehicles for transport purposes and supply engineers should themselves ride about their supply areas, if no farther, in an electrically-propelled car; than which there is no better advertisement for the cleanliness, and silent, odourless and unobtrusive power of electricity. Just as all electrical men who take a pride in their industry live in properly electrified homes, all who are in a position to run a car should think long and earnestly before purchasing a petrol-driven machine. Coming from the electrical industry itself a push of this kind would give a great impetus to a development the extent of which we can hardly visualise to-day. It is no exaggeration to say that where electricity and some other means are available for performing a certain job of work, electricity, if properly applied, will always do it better than the alternative. Why, then, do we tacitly acknowledge the superiority of the fuel-wasting and odoriferous petrol engine. The performance of storage batteries, and the service of charging stations are doubtless susceptible of improvement, but such improvements will only follow a definite determination to put the electrically-propelled vehicle in its proper place in the transport world. The extent of the field is enormous, but it is humiliating to find, according to a return issued by the Ministry of Transport that out of a total of 2 059 346 motor vehicles licensed at May 31st last only 1 405 were electrically-propelled, and that out of a total of 14 603 mechanically-propelled goods vehicles registered for the first time during the period March—May, 1929, only 11 were electrically propelled. These figures are at once a reproach and a challenge.

Electric Baths at Taunton.

CONGRATULATIONS are due to Mr. A. J. HOWARD, borough electrical engineer of Taunton, for securing a full electrical service in the new swimming and slipper baths which were opened on August 1st. In addition to the lighting installation, electricity is used for power purposes, and electric motors find application in the filtration plant and elsewhere. Heating is not actually by electricity, but steam from the power station is very usefully employed in this direction and no gas or coal is used anywhere in the establishment. As if this were not enough to mark the new baths as an Electricity Department job, four E.P.E.A. members of the generating staff won the team race shield at the opening gala.

A Curious Policy.

READERS will recollect that we have recently published several letters containing complaints about the service of a London electricity supply company. The ground for complaint was very unusual, for in this case the company's prices have recently been reduced to a reasonable level to consumers electing to be charged on an "all-in" basis. The introduction of the two-part tariff suggested to some consumers that it might now be economical for them to use electricity in their homes for heating and cooking. Curiously enough, according to the complainants, inquiries about cookers and fires brought from the supply company a warning that a certain very low figure of maximum demand must not be exceeded. In one case the figure quoted was 3 kW, which definitely excludes the use of a normal-sized cooker or electric fires. The complaints which have come to our notice are made by men who are engaged in the electrical industry, but there must be a large number of non-electrical people on this company's mains who are similarly placed and who represent a big potential domestic load, for the development of which the new two-part tariff was presumably introduced. Feeling that the company should have an opportunity to state its case and deal with these remarkable criticisms, we wrote to the supply company suggesting that they might care to reply to the points raised by correspondents in our columns. Judging by the silence which they have maintained up to the present, the company do not wish to reply, though it seems obvious that some sort of statement is eminently

Digitized by Google

desirable, as their policy of seeking domestic load by the offer of a two-part tariff and then declining to give the service when demanded is one that is not likely to be easily understood by consumers.

"Light's Golden Jubilee."

MANY British electrical engineers, probably viewing the matter in the light of corresponding celebrations in this country, seem to have greatly underestimated the extent of the "Light's Golden Jubilee" celebrations in which the National Electric Light Association of America is "telling the world" that Mr. EDISON invented the incandescent electric lamp. It is all very well for us to adopt a complacent attitude and assure ourselves and each other that, despite the propaganda of the N.E.L.A., we know that SWAN is the real hero of the piece. In these columns we have more than once endeavoured to indicate the widespread nature of the American propaganda, and how such countries as South Africa and Japan have been prevailed upon to co-operate. A further idea of the magnitude of the effort may be gained from the statement that a new 2 cent postage stamp has been issued by the U.S. Post Office Department "to commemorate the fiftieth anniversary of the perfection by THOMAS ALVA EDISON of the incandescent lamp," and that the first issue of 180 000 000 stamps was sold so quickly that a second issue of 110 000 000 stamps has been authorised.

Sulphur Compounds in Flue Gases.

SINCE the London Power Co. announced the discovery of a perfectly practicable and commercial solution of the "sulphur problem" we have been reading an article in "The Chemical Age," in which Mr. J. ARTHUR REAVELL, President of the Institution of Chemical Engineers, puts forward a plan which he believes will quite easily remove 90 to 95 per cent. of the sulphur compounds from the flue gases. Briefly, the method advocated is to saturate the gases entering the flue by means of a rotary atomiser with warm water from the condenser discharge, the atomiser being rotated independently of the water, and the water discharged on to this rotating disc or roller from the outside. Mr. REAVELL suggests that the subsequent washing for sulphur removal should take place in a chamber so arranged that the water should present as large a surface as possible to the gases, with the maximum possible time of contact between water and gases. It is pointed out that by this method a certain amount of entrained water is carried out of the chimney unless eliminators are provided to remove the surplus water.

Electricity in Factories.

AMONG the many conversions which the application of electricity has brought about must be added that of converting workshops into factories, for according to the Chief Inspector of Factories the installation of power-driven machinery into even the smallest workshop raises its dignity to that of a factory. Bearing this in mind, it is interesting to note that, in spite of the necessarily increased number of factories, the total number of fatal accidents due to electrical causes during 1928 was only 26. This figure, based on facts given by the Senior Electrical Inspector, whose contribution to the Annual Report of the Chief Inspector is dealt with elsewhere in this issue, is largely made up of accidents involving voltages below 500, and its smallness is in a great measure due to regulations and inspection, together with the improved methods of manufacture of accessories, portable tools, etc. That this is so is shown by the fact that the total number of reportable accidents during 1928 was actually less than fifteen years ago, notwithstanding the increased application of electricity to industry. The fatality rates per 1 000 accidents in the various industries record "electrical generating stations" as being responsible for 19, a decrease of 10 when compared with 1927, the lower figure being due in some degree to the fact that h.t. switchboards are now adequately protected against contact, and fitted with protective devices against mistakes by their attendants. Whilst opinions differ as to the advisability of interlocking, which, as Mr. SCOTT RAM points out, in cases of temporary disconnection or repair has itself been the cause of some accidents, there is little doubt that some of the serious accidents which have occurred would have been prevented by its adoption. The Home Office Industrial Museum, which was opened a year ago in connection with accidents in factories, has proved of considerable interest, nearly 8 000 persons having examined the exhibits during the year. Though the museum was intended for use as a demonstration centre against accidents, use has also been made of it to ascertain the best type of electrical equipment and methods of lighting for laboratories and lecture rooms, while the secretary of a golf club inspected the lighting exhibit before embarking on a new colour scheme for the club house!

Rate Aid Again.

THERE are very few municipal electrical engineers who are unaware of the injustice of transferring large sums from the profits of their electricity undertakings to the relief of the general rates, but too many of those who are afflicted with Electricity Committees and Town Councils to whom this policy appeals keep this knowledge to themselves. A vigorous statement of the case against rate relief is included by Mr. F. W. PURSE in his last annual report as engineer and manager of the West Ham Electricity Department. While there is nothing particularly new in Mr. PURSE'S argument, it is worthy of emulation as a concise and effective pronouncement. He points out that "apart from the moral obligation of repaying the amount formerly advanced out of the rates, there is no reason whatever why any contribution should be made in aid of rates. One is well aware of the old cry of the loans being raised on the security of the rates; but the fact is always overlooked that the consumers of electricity are making a handsome present to the ratepayers in the shape of the assets of the undertaking, which could be disposed of at any time and a handsome profit realised. It is therefore difficult to appreciate why the rates should be subsidised to benefit such ratepayers as the railway companies and gas companies, who take all the benefit of the Department and do not assist it in return. If all the ratepayers were consumers of the Department, there might be something to be said for 'rate aid,' but otherwise it is a very vicious doctrine and a hindrance to progress and development." If every municipal electrical engineer concerned would include a paragraph of this kind in every annual report we would soon see the end of indiscriminate rate relief.

The E.T.B.I. Competition.

KNOWLEDGE of the game of judging distances, in which so many electrical engineers acquired proficiency fifteen or so years ago is proving useful in the "cable-laying" competition which has been organised in aid of the funds of the Electrical Trades Benevolent Institution. This interesting contest, of which details have previously been given in our pages, is tempting a gratifyingly large number of entrants, and we understand that though barely a month has elapsed since the scheme was launched only a hundred books of tickets at present remain unsold. As it appears probable that no further tickets will be printed when the present stock is disposed of, intending competitors are advised to make immediate application for their ticket requirements. By entering this contest electrical men secure an interesting spare-time occupation, with the chance of winning one of a number of handsome prizes, and lastly, but by no means of least importance, they assist the Institution in its increasingly difficult task of devoting their ridiculously small funds to the assistance of all deserving and necessitous persons who are or have been engaged in the electrical industry.

CONCRETE POLE DESIGNS AND COSTS—II.

An Examination of the Differences in Cost of Wood and Concrete Lines—The Most Economical Construction—Disadvantages of Steel—Detailed Examples of Costs.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E.

(*Continued from page* 103.)

APART from the fact that wood is a better insulator than reinforced concrete, the latter construction is far superior in every way, and therefore should justify a higher price than wood construction. Furthermore, the chief questions at issue have nothing to do with the better insulating properties of any one material over the other.

The two chief questions are :

(*a*) Can the concrete construction compete favourably in initial first cost of line for the general sizes (or weights) of distribution lines, i.e., lines averaging slightly above the minimum equivalent of three or four 0·025 sq. in. copper conductors ?

(*b*) What percentage higher price will justify a reinforced concrete pole line of the equivalent strength of wood ?

The initial equivalent design strength favours wood at the start, but rarely favours the common wood-pole foundation at the start because it is usually set in a back-fill. On the other hand, for equal initial strength, concrete construction is favoured throughout its long life because it increases in strength with age, and is weakest when new. Also, for equal strength of wood or steel, if concrete construction cost is favourable in the lighter weights, it is assuredly still more favourable in the heavier construction such as main power transmission lines. Certainly, engineers must first assure themselves of (*a*) and (*b*)—the endeavour of this article is to help satisfy the mind on these two most outstanding points.

The appreciable difference in cost between the wood pole line and the concrete pole line is due to the difference in total weight and cost of the transported materials *plus* the total cost of casting and curing, etc., of the concrete pole. For the wood pole we simply have the cost of the timber delivered to the nearest railway siding or station *plus* the cost of haulage, handling, erection, and foundation. For the reinforced concrete pole of the general kind (not the kind proposed by the writer and discussed herein with costs) there is the cost of casting, curing, storing, and handling at the pole works, *plus* the cost of railway transport, *plus* the cost of hauling, handling, erection, and the costs for concrete foundation. The writer's proposal is to transport and haul only the necessary steel and cement and sand to the pole site and cast the pole right in its final position on a finished and undisturbed reinforced concrete foundation—in this way, the concrete pole *line* can favourably compete in first cost with the wood pole *line*, and also provide a superior and usually a more reliable line.

Quality of Material.

The so-called " first class " timber of to-day is not what it used to be, and what there is of the first grade is difficult to find and uncertain in quality because of the depleted forests, etc. The resulting tendency is well marked on the decreased life of the relatively poorer quality timber. Moreover, inferior or defective maintenance, or a reduction in maintenance costs, bring about decreased life and increased failures. A study of the relative best conditions and properties of the soil, wood, and the most suitable kind of foundation, are also left so haphazard that the period of life is further reduced or/and maintenance costs can be increased beyond the estimated values allowed herein for wood and steel.

The most efficient and economical line construction is not necessarily wood or steel or concrete—something beyond a mention of the particular material must be included in the design and construction. For instance, neglecting the smaller or the heavier-weight construction, there are several kinds of wood poles and frames, several types of steel poles, and several processes for concrete poles. The first cost for wood and steel respectively varies within fairly narrow commercial limits for a given set of conditions ; on the other hand, the casting of a reinforced concrete pole will vary all the way from an expensive machine-made one-piece long-distance-transported heavy-type, to a very much less costly and equally strong (or stronger) cheaper-made but heavier-type pole, entirely relieved from transport and handling and their consequent costs and risks. The writer is mainly concerned with the design that eliminates any possibility of bird troubles ; a type that offers the most reliable line ; a line that satisfies reasonable initial total first cost ; longest life ; minimum cost of maintenance ; and minimum service interruptions as judged from all points of view. All these should favour the reinforced concrete pole line proposed by the writer.

The three main grades of overhead lines we need consider are :—

(1) Those lines where the annual interest on the total capital expenditure is equal to, or is greater than, the total depreciation annuities *plus* operating expenses. Taken as a general rule, these conditions are typical of the wood pole line.

(2) Those lines where the annual capital interest is appreciably higher than the equivalent wood pole line, and the total depreciation annuities *plus* operating expenses are appreciably less than the equivalent wood pole line. These conditions will usually conform to, and are quite typical of, steel pole lines.

(3) Those lines where the interest on the total capital investment is no greater than the steel pole line and may equal the wood pole line, but is much greater than the total depreciation annuities *plus* operating expenses. These conditions will, in practically all cases, conform to the reinforced concrete pole lines of the construction proposed by the writer herein, and referred to in THE ELECTRICIAN of April 5th, June 28th, and July 26th.

Wood, Steel or Concrete ?

In making a choice of wood, steel or concrete, it is vital to keep well in mind that the type and construction must under no account be neglected, and that the factor where the greatest economy can always be made (apart from the advantages derived from the writer's proposed construction) is in the sum total costs of depreciation annuities and operating expenses.

It is becoming more generally realised that the climatic and atmospheric conditions of this country are highly rust-forming—that the steel pole line is quite as costly as the wood pole line—that it is not so safe and is a less protective line than the wood pole line. In other words, the wood pole line is more efficient and more economical than many types of steel pole lines now in common use. In order to understand their meaning it is necessary to add that practice has taught engineers to think of efficiency in terms of delivering power at the lowest cost, which include such relative cost items as the initial cost, depreciation annuities for the materials, cost of maintenance, and cost due to service interruptions caused by inefficient design and construction, replacing of poles, bird troubles, etc. The summary of initial costs, interests, etc., given herein, shows that the steel pole is not so efficient nor so economical as the wood pole line, because the *annual total cost for upkeep of the steel pole line is higher for the transmission of the same amount of power.*

The reinforced concrete pole will either retain the 100% original supporting strength, or, with age, maintain a strength still greater. As most crippling loads causing failure are momentary jerking loads, the reinforced concrete pole of equal design strength of the wood or steel pole line, respectively, is stronger, due first to the greater flexibility or/and less number of poles (compared with wood) for a given length of line affected, and, in the second place, it has the advantage of the superior foundation, either when new or old. Painting and renewing or resetting poles are processes entirely eliminated from concrete construction. Landowners and tenants are freed from excessive traffic and consequent troubles during its entire longer lifetime. Wayleave costs and annoyances are reduced to a minimum. The insulator problem is simplified. Thus, from the constructional and maintenance viewpoints, the concrete pole has many advantages.

Now let us take a detailed example of a very small sized primary distribution line consisting of wood, steel, and concrete, respectively. The following results will also closely resemble the equivalently weighted communication-circuit line or a 230/400 V 4-wire secondary line, but will still further favour the concrete construction as compared with wood construction.

Example.—One three-phase, 3-wire, 0·025 sq. in. copper conductor line for 11 000 V.

at 3·3% of £91	—	3 0 0	—
at 3·0% of £91	—	—	2 14 0
Operating expenses, *nil*, or	0 10 0	0 10 0	0 10 0
Total annual expenses	15 16 0	14 19 0	14 8 0

NOTE.—In the cases of wood and steel, *the operating expenses* nclude costs for painting, replacing, and other annual expenses. To these costs there are the expenses accrued from relative interruptions to service, which vary for each case independent of the type of construction.

Taking a very good average life for the steel pole at 35 years, then, for this period we have the following costs for the respective wood, steel and concrete pole lines. In view of the fact that the average life of the reinforced concrete pole is longer than 35 years, we obtain a further advantage.

The relative gross total costs of the steel and wood respectively will alter with the varying conditions of first costs, total annual expenses, and life period. For instance, it is seen that the wood pole line is the highest for the 35-year total upkeep cost—as a matter of fact, for a 35-year period and equal factor of safety it is almost certain that other first costs for wood poles would have to be included here.

For a better comparison we may apply the 25-year period, and/or the lower depreciation annuities, etc., which are included to answer a wider scope for practical usefulness.

Relative Grand Total Costs per Mile of Line.

	(Steel) £ s. d.	(Wood) £ s. d.	(Concrete) £ s. d.
Cost of Construction	273 2 6	203 11 0	218 5 6
Upkeep cost for 10 years for

(C)	1 034 7 6	999 16 0	722 5 6

That is to say, during the 35 years the wood pole line will have cost £354 10s. 6d. more than the reinforced concrete pole line, which means that, in the long run, it is about as cheap to build and operate two concrete pole lines as it is for one wood pole line, or one steel pole line; this is decidedly so when we account for the expenditures for new wood poles, etc., within the 35-year period, the added cost of service interruptions thus accrued along with loss of revenue due to cutting off the energy supply, including extraordinary labour expenses required to cope with these irregularities, etc.

By using wood poles instead of reinforced concrete poles there is a little saving in the *initial* first cost, but the electricity supply undertaking must pay £10 11s. more per mile each year for maintaining the wood pole line, excluding greater wayleave and other costs that can be added thereto. Thus, to save a little in first cost, the supply company owning the wood pole line is operating it as if it were borrowing money at the rate of interest amounting to (£10 11s./£15 15s.) × 100 = 66% *per annum*.

A Considerable Annual Saving.

The *annual* saving by installing the concrete pole line is equal to more than £1 000 per 90 miles of line, or at least £35 000 for the highest life period and the same length of line.

Furthermore, the installation of the concrete pole line represents one of the most beneficial and *the* most permanent manner of supplying cheaper electricity to the general public. In other words, an aggregate total of 900 miles of line capable of transmitting no more than, say, 300 kW means that the electricity supply undertaking can deliver power over the concrete pole line at a cost £3 3s. cheaper per kW than over the wood pole line.

We therefore have very good reasons for asking: Why borrow money at 66% interest per annum? Why build a less reliable line that costs £3 3s. *more* per kW delivered the same distance? Why not save the interest on the borrowed money, and at the same time obtain a better line and also give cheaper electricity supply for equal or less gross total costs?

The light-weight (3-wire, 0·025 sq. in. copper conductor) construction given here is decidedly the most favourable condition for the wood pole, but even then adverse results are shown. It is therefore evident that the wood pole line will be less able to compete with the heavier types of construction—this also applies to telegraph and telephone-circuit lines with the larger number of circuits. For 33 000 V and 132 000 V lines the reinforced concrete pole line (of the construction proposed herein) is superior in practically every way to steel or wood of any type or kind.

COMMERCIAL PROPERTIES OF BAKELISED ASBESTOS.

Properties of a New Material—Comparative Tests on British and Continental Samples—Points for the Raw Material Inspection Department.

By "H. T. U. R."

THE synthetic resins have now been known for a considerable number of years, and their commercial applications have developed to a very great extent, especially in the electrical industries, where stability of insulation is of primary importance. By no means the least popular form of the material is the sheet, where resin-soaked paper or cloth is pressed and cured into a compact board with highly finished surfaces. Lately a newer type has been launched on the market having asbestos as base. It is with this latter material that the present article deals.

When treating first with an entirely new material there immediately arises the question of what physical limitations we should expect and permit. While fundamentally similar to the paper and textile base sheet materials, the asbestos obviously changes the nature of the product. It might reasonably be expected that bakelised asbestos would be more resistant to heat than the paper material, and such proves to be the case in actual fact.

The usual tests applied to phenolic sheets are as follows :—(1) Loss in weight due to prolonged heating; (2) Gain in weight during boiling in water; (3) Some form of insulation test after prolonged humidifying; (4) Strength and flexibility tests varying according to the thickness of the samples under consideration.

Chemical tests carried out on samples of bakelised asbestos gave results as follows :—

	Continental Manufacture.	English Manufacture.
Ash value (asbestos base) ..	59·2%	57·1%
Litmus reaction	Faintly alkaline	Neutral
Matter soluble in water	6·6%	1·7%
Matter soluble in spirit	1·3%	4·9%

Experimental heat tests were carried out, and, heated at 280 deg. F. for 1½ hours; the Continental material gave 1·6% loss, and the English 0·85% loss. A further two hours gave an additional loss of 0·5% on the Continental, and 0·03% on the English.

Raising the temperature to 350 deg. F. for an additional four hours gave no more appreciable loss, but gave rise to embrittlement in the Continental sample, and to embrittlement and slight blistering in the English.

Effect on Metals.

In electrical work at raised temperatures it is important to know the possible chemical effect of the materials on metals with which they are likely to be in contact, such as springs, switch parts, etc. To make conditions as stringent as possible the parts were heated up to 270 deg. F. in contact with a series of metals, nickel silver, brass, copper, phosphor bronze, monel metal and steel, and then, while still remaining in contact, were humidified by 72 hours in a water-saturated atmosphere at room temperature. In all cases the metals were slightly coloured, but there was no trace of real corrosion.

The practical insulation tests applied to insulating sheets, while much in dispute at the present time, are yet still carried out by the big concerns of this country and America. It was, I believe, in the latter country where the Megger test at screw centres ranging from 1 in. to 1½ in. first originated.

At 1⅜ in. centres the Continental material averaged 86 MΩ, while the English averaged 700 MΩ. To get these figures a series of twenty tests was carried out on material ⅛ in. thick.

Tests for the loss in weight due to heating are usually carried out by taking a 1 in. square of the sheet, carefully weighing, and then heating at approximately 280 deg. F. for half an hour. Such tests are standard for the paper and textile base materials. Applied to the samples in question both averaged 1%.

For the gain when boiled in water the same samples were used. Two hours is the usual time for the test. They averaged 0·9% and 0·75% respectively.

Glancing now at the results of the chemical tests, it appears that the Continental material is somewhat better cured, which fact may be deduced from the lower spirit extract. However, due to its higher water soluble matter, it may be supposed that the asbestos base is not so good.

In many instances bakelised asbestos sheet will be required to work in contact with resistance wires, and thus its heat resistivity is important. The tests shown above indicate that it may safely be used up to some 300 deg. F.

So far as the present writer is aware, there is no official specification for bakelised asbestos sheet, and therefore it may be of interest to give a few facts culled from extensive tests and experience with commercial deliveries which indicate what may be obtained, and at the same time what is necessary for insuring a good class material well able to withstand the strenuous service conditions to which it may on occasion be subjected.

Asbestos.—Content should fall between 45 and 65%. Determined by the usual incineration method.

Alkalinity.—Nearly all commercial material is somewhat alkaline, and, if a neutral sheet be insisted upon, very little can be passed into the factory. It is best, therefore, to specify that a roughened and moistened surface shall just colour red litmus paper. It is a crude test, perhaps, but one which experience shows is quite good enough for the usual run of work.

Spirit-soluble matter.—A five-hour repeated extract should give a figure not exceeding 6%. A higher figure than this means that the sheet has not been fully cured. Sometimes, of course, half-cured sheets are required for moulding and other work, when this test bears no weight.

Acetone test.—Often stated to be of use, but very doubtful in practice.

Tarnishing.—Raised to 250 deg. F. in contact with polished copper, and after three hours removed to saturated atmosphere and allowed to remain there at atmospheric temperature for 12 hours, there should be no observable corrosion. Actually this test need not be applied, since the writer knows only one case where results condemned the sample.

Heat Loss.—Carried out as described above, loss for sheets up to ⅛ in. thick should have a maximum of 2%.

Gain in Water.—As tested as above should not be greater than 2% for sheets up to ⅛ in. thick.

Destructive Heat.—Twelve hours at 330 deg. F. should not harm the material, nor render it very much more brittle.

Electrical Tests.—So long as the surface is good and the sheets conform to the tests just mentioned, it is the experience of the writer that electrical tests are redundant. The percentage gain in water seems to control the electrical insulation, which naturally has to be carried out after humidifying.

In conclusion, the writer wishes to point out that while the results of the experimental work given in the foregoing article are accurate to the usual laboratory degree, they are intended for use by the Raw Material Inspection Department, and must not be considered in an academical light. If, however, the limitations be met by material, then there should be no trouble experienced in service, which, after all, is the great thing.

ALUMINIUM STANDARDS.

Five New Specifications Issued by the B.E.S.A.

FIVE new specifications relating to aluminium have recently been issued by the British Engineering Standards Association. Two, numbered 359 and 360, are for 98% aluminium notched bars and ingots and rolling slabs and billets and 99% aluminium notched bars and ingots respectively. These deal with the chemical composition of the bars, etc., and the provision of samples for analysis. The other three specifications are for 7% copper, 12% copper, and zinc-copper aluminium alloy castings, and are numbered 361, 362 and 363 respectively. The chemical compositions are specified, together with requirements relating to chemical testing, dimensions, margins of manufacture, and freedom from defects. Mechanical tests are laid down, and provision is made for the supply of test samples.

Copies of these specifications may be obtained, price 2s. 2d. each post free, from the Publications Department, British Engineering Standards Association, 28, Victoria Street, London, S.W.1.

LIMITS OF THE ECONOMICAL TRANSMISSION OF ELECTRICAL POWER.*

A Comparison of the Relative Cost of Carrying Coal and Conveying Energy Electrically Between Two Given Points—Hydro-Electric *v.* Steam Stations.

By Prof. E. W. MARCHANT, D.Sc, M.I.E.E.

THE transmission of electrical energy nowadays is primarily an economic problem. There is no great technical difficulty in transmitting energy over distances of several hundred miles, though there has been a good deal of discussion in the past as to the best method to use. At the present time, however, apart from a few installations in France and Switzerland, nearly all power transmission is carried out by three-phase high tension currents. In America distances of 300 miles and over have been covered, and pressures up to 350 000 V have been employed. (Here again it is the economic question which determines the pressure to be employed.) There is no overwhelming technical difficulty in using pressures up to 1 000 000 V.

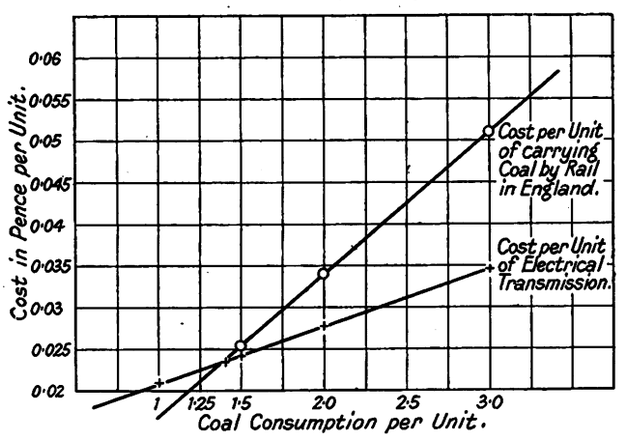

Fig. 1.—Comparison between cost of carrying coal, and cost of electrical transmission per unit for varying coal consumption per unit.

Experiments have been made on overhead transmission lines which more closely resemble bridges than the transmission lines to which we are accustomed, which are designed for operation at a pressure of 1 000 000 V. The most economical pressure to use on a transmission line is, of course, governed by the cost of the line and the cost of the waste energy according to the well-known Kelvin's Law.

Comparison of Costs.

When central stations are operated by steam boilers driving turbo-generators it has often been suggested that the most economical arrangement would be one in which the power station was located at the coal mine, and the energy conveyed electrically to the place where it was to be used. It may be of interest to discuss one case in order to determine the conditions under which such an arrangement can be used economically, though it must be remembered that in settling the site of a modern super station there are many factors, such as the supply of water, which have to be taken into account besides the proximity of a coal mine.

As an illustration, the case of a town such as Liverpool may be considered. Liverpool has adequate railway facilities and a good supply of coal within 20 or 30 miles. It would be possible, as far as purely technical considerations are concerned, to erect a large super-station at Wigan, about 20 miles away, where there are coal mines giving an ample supply of excellent fuel, instead of in Liverpool, and to convey the electrical energy generated in this station by high tension overhead lines to Liverpool. The relative costs of these two methods of providing a supply are given below.

Let us assume that a station of 100 000 kW can be erected in either of the two places, and that there is no great difference between the cost of erecting this station at Wigan and in Liverpool, and that the two stations have the same thermal efficiency.

If the station is located in Liverpool, the only extra charge involved as compared with a station at Wigan, is the cost of conveying coal from Wigan to Liverpool. This amounts to 3s. 2d. per ton.

For a station of this size a thermal efficiency of 20% may be assumed as a working figure. Hence $5 \times 3\,430 = 17\,150$ B.Th.U. must be used per unit, or, taking coal with a calorific value of 11 500 B.Th.U. per lb., the consumption of coal per unit generated is very nearly 1·5 lb. The extra coal cost in Liverpool, therefore, as compared with Wigan is 0·0254d. per unit.

To convey the energy electrically would involve the installation of transformers at Wigan and Liverpool, and the erection of an overhead transmission line capable of transmitting 100 000 kW. It has been assumed that the line operates at a pressure of 132 000 V, as figures for costs of transformers and overhead lines are available for a line of this description.*

$$\text{Pressure in kV} = 5{\cdot}5\left(L + \frac{\text{kW}}{100}\right)^{\frac{1}{2}} \text{ which gives 176 kV.}$$

A later formula given by Evans and Sells gives 150 kV.

Capital Costs.

The cost of transformers used in the English grid scheme is approximately 8s. per kW, and the two sets would therefore cost £80 000. The cost of the switchgear for controlling the output to a duplicate high tension transmission line is approximately £70 000. The three-phase overhead transmission line is required to carry a maximum load of 100 000 kW at, say, 0·9 power factor and 132 000 V. Such a line would consist of a standard double circuit six-wire line, with each of the six conductors of aluminium steel of equivalent conductivity to 0.175 sq. in. copper. The conductors are carried on wide base lattice towers with 900 ft. normal spacing. Such a transmission line erected over fairly level country will cost approximately £3 000 per mile, and will involve a further capital expenditure of £60 000. The usual loan period guaranteed for this class of work is 25 years, which involves a charge for depreciation and sinking fund of 2·56%. Allowing interest at 5%, this gives a standing charge for capital expended of 7·56%, say 7·6%.

The standing charge on this installation, therefore, amounts to £16 000 per annum. Assuming a load factor of 31% the number of units transmitted per annum is 270 million and the additional cost per unit due to standing charges is 0·0142d.

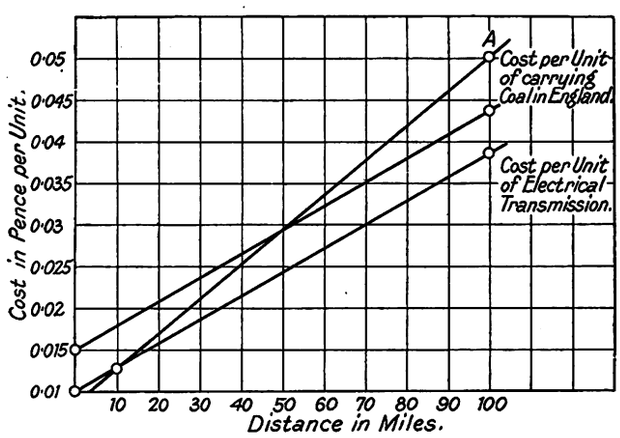

Fig. 2.—Comparison between cost of carrying coal and cost of electrical transmission per unit over varying distances. Coal consumption 1·0 lb. per unit.

per unit. In addition to the standing charge, the cost of energy wasted in the transformers and transmission line has to be estimated.

According to figures for which I am indebted to Mr. A. G. Ellis of the Metropolitan Vickers Electrical Co., the no-load loss for 100 000 kW of transformers of this rating may be taken at 330 kW; the average copper loss over a year with a 31% load factor is 140 kW. The ratio of iron loss to copper loss may vary within fairly wide limits; it has been taken at 1:2:5 at

* Paper read before Section G of the British Association, South Africa, on August 1st.

* The pressure is rather less than that estimated from the empirical formula given by W. P. Dobson for Overhead Transmission Lines in America.

Digitized by Google

full load. The total loss in the two sets of transformers is therefore 940 kW.

The energy lost in the transmission line may next be estimated. The resistance per mile of conductor is 0·26 Ω and for the double line 0·13 Ω per mile, giving a resistance per mile for 20 miles of 2·6 Ω. The R.M.S. current with a load factor of 31% (assuming form factor 1·33) works out to 2·00 A, giving an average power loss per phase over a year of 104 kW, or a total power loss for the three double lines of 312 kW. The approximate average power loss, therefore, in the transformers and line, amounts to 1 252 kW, and the units wasted per annum equal $11{\cdot}0 \times 10^6$ units, or approximately 4% of the units transmitted.

The works cost of generating electrical energy (i.e., charges for coal and oil) in a station of this size in Liverpool, according to published tables, is about 0·25d. per unit, and the wasted energy in the transformers and line involves therefore an additional cost of approximately 4% of 0·25d.; the actual figure is 0·01014d. (see Table 1). The total extra cost per unit, therefore, of conveying energy electrically between these two places amounts to 0·0243d. per unit as compared with the additional charge of 0·0254d. for carrying coal. When electric power transmission is carried out on the scale suggested, and under the conditions assumed, there is a difference of only 0·0011d. per unit between the cost of carrying coal and of conveying the energy electrically. It should be remembered, however, that this estimate is based on the assumption of equality of cost of erection and operation of the power stations in the two places, and that in coming to a decision as to the most economical location for the power station it will be necessary to estimate station costs very carefully.

TABLE 1.—COST PER UNIT IN PENCE FOR ELECTRICAL TRANSMISSION OVER 20 MILES AT 31% LOAD FACTOR.

Transformer Iron Loss				0·00535
Transformer Copper Loss				0·00226
Line Copper Loss				0·00253
Total cost of Waste Energy				0·01014
Total Cost per unit				0·02434

Relative Economies.

It is interesting to estimate the effect of variations in efficiency of plant and quality of fuel. If the coal consumption per unit, which has been assumed to be 1·5 lb. were reduced to, say, 1 lb., the cost of coal transport would be reduced in direct proportion to the fuel consumption per unit, but the cost of electrical transmission would only be affected by the reduction in the cost of the waste energy. Fig. 1 shows the relation between the cost of carrying coal and fuel consumption per unit, and cost of conveying electrical energy and fuel consumption per unit, for a range of fuel consumptions from 1 to 3 lb. of coal.

The cost of transport varies directly with the fuel consumed, and falls from 0·051d. per unit with 3 lb. of coal per unit to 0·017d. with 1 lb. of coal per unit. The capital charges involved in electrical transmission are not affected by an improvement in the thermal efficiency of the central station, but the cost of the waste energy is reduced. The cost of the coal and oil used in generating electrical energy in a station of this size is about 0·25d. per unit with a coal consumption of 1·5 lb. per unit. The cost of waste energy, therefore, at other fuel consumptions may be estimated roughly by allowing for the reduced fuel consumption.

On this assumption the cost of generating the unit falls from 0·25d. at 1·5 lb. of coal per unit to 0·167d. at 1·0 lb. of coal per unit, and rises to 0·50d. at 3 lb. of coal per unit. The cost of transmitting the energy electrically has been estimated for different fuel consumptions, and is shown in Fig. 1.

These figures are subject to slight modification, since it may be expected that the lower fuel consumption per unit will be obtained with a better quality of fuel and a more expensive plant, but the result is of interest, since it shows that the case for electrical transmission is less strong when the generating plants in the central station are efficient than when they are less efficient. At this distance there will be equality of cost between the two methods when the consumption of fuel per unit is about 1 lb. of coal.

It is evident that the relative advantages of transporting coal and conveying energy electrically will vary with the distance between the coal mine and the centre of the distributing network. It is impossible to give general figures for different distances, as local conditions vary so much. I have obtained figures, however, from one of the English railways for the cost of hauling coal over distances of 20 miles and 100 miles respectively. The costs, as supplied to me by Mr. Wharton of the L.M.S. Railway, are 3s. 2d. and 9s. 6d. per ton respectively. The cost of transport of coal is made up of two parts, one depending on the cost of hauling the coal along the track, and the other on the cost of handling at the terminals. It may be assumed that the cost of hauling along the track is proportional to the distance covered, and that the cost of handling at the terminals is the same for the two hauls.

Cost of Hauling Coal.

We can represent the cost of hauling coal, therefore, as equal to $A+BL$, where L is the distance in miles over which the coal is transported, and A and B are constants. The values obtained from the above figures are $A=1{\cdot}6$s. and $B=0{\cdot}079$s. respectively, or $A=19{\cdot}2$d. and $B=0{\cdot}95$d. This gives a cost of handling coal at each terminal of 9·6d. per ton, and a cost of hauling coal per ton mile of 0·95d. These values, of course, will be very different in different countries.

Assuming that the station uses 1 lb. of coal per unit, one ton of coal will produce 2 240 units, and, therefore, the cost per unit of handling coal is equal to $0{\cdot}0085+0{\cdot}00032L$ d. The curve A in Fig. 2 shows the way in which the cost of coal per unit delivered varies with the distance from the source of supply.

If energy is conveyed electrically, the cost of transmission may also be divided into two parts, one of which depends on the distance, while the other does not. The fixed part of the electrical transmission charge is that involved in the installation of transformers and switchgear at the two terminals, and the loss of energy in them during the process of transformation.

The variable part is that due to the cost of transmission along the line, and will be proportional to the distance It is made up of the capital charge involved in the erection of the transmission line and the cost of the energy wasted in it. Taking the figures given above for the cost of transformers of 100 000 kW capacity, and taking the capital charge at 7·6 per cent. on £150 000 (the cost of the transformers and switchgear) the annual charge amounts to £11 400 per mile. The cost of the transmission line is £3 000 per mile, and the annual charge at 7·6% amounts to £228 per mile. The annual charge therefore for erection of transformers and transmission line is $£11\,400+228L$. Assuming a works cost of, say, 0·17d. per unit the annual charge for energy lost per kW is 1 440d., or £6 approximately. The loss in the transformers is £5 650 per annum.

The losses in the line amount to 15·6 kW per mile, and therefore involve an annual charge of $15{\cdot}6 \times 6$ or £94 per mile of line. The annual charge for the losses, therefore, is $£5\,650+94L$ per annum, and the total annual charge amounts to $£17\,050+322L$.

Since the number of units transmitted is 270 million, the total annual charge in pence per unit works out to $0{\cdot}0151+0{\cdot}00286L$ d. This quantity is shown in Fig. 2, and it will be noticed that the lines cross at a point corresponding with transmission over about 50 miles.

With a consumption of 1·5 lb. per unit the cost of transport of fuel is increased 50%, and amounts to 0·0128—0·006d. per unit. The cost of transformers and switchgear and transmission line is the same, and the annual capital charge, therefore, remains unaffected and equals $£11\,400+228L$. The cost of generating one unit will be more.

Taking the figures given above, the works cost is equal to 0·25d. per unit (as against 0·17d.) and the cost of the energy lost in the transformers and the transmission line is $£8\,500+140L$ per annum.

The total annual charge for electrical transmission, therefore, is increased to $£14\,570+368L$ d. Curves are drawn in Fig. 3, and it will be seen that with the conditions assumed the electrical method of transmission is more economical when the distance covered exceeds 15 miles.

Influence of Load Factor.

The figures given above are all calculated on the basis of a 31% load factor, the approximate value to-day in a large town like Liverpool. It is of interest to consider the effect of varying load factor. As a standard for comparison, the case worked out in the first section may be taken. If the load factor is increased to, say, 50% the number of units trans-

Digitized by Google

mitted will be increased in the ratio of 50 : 31 and will amount to 435×10^6 per annum.

TABLE II.—COST PER UNIT IN PENCE FOR ELECTRICAL TRANSMISSION OVER 20 MILES AT 50% LOAD FACTOR.

STANDING CHARGE ON CAPITAL.		
Transformers	0·0063	
Transmission Line	0·00252	
Total standing charge		0·0088
COST OF WASTE ENERGY.		
Transformer Iron Loss ..	0·00332	
Transformer Copper Loss ..	0·00274	
Line Copper Loss	0·00306	
Total cost of waste energy		0·00912
Total cost per unit		0·01792

The amount of coal needed in the power station will be increased roughly in proportion to the energy generated.

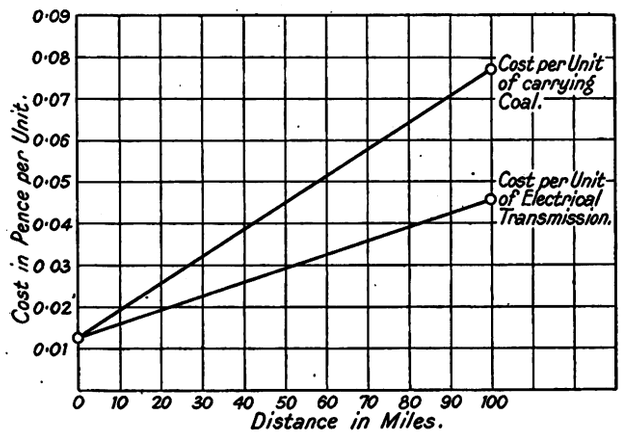

Fig. 3.—Comparison between cost of carrying coal and cost of electrical transmission per unit over varying distances. Coal consumption 1·5 lbs. per unit.

There may be a slight reduction in the fuel consumed per unit generated, but if the generators in the station are operated always near their most economical load, the difference will be small. The cost of transport of coal per unit generated will therefore not be affected to any appreciable extent.

As regards the electrical method of transmission, the capital costs of the transformers and line will remain unaltered, and the charge per unit generated will therefore be reduced in the ratio of 31 : 50 and will amount to 0·0088d.

The iron loss in the transformer will remain unaltered, but the copper loss in the transformers and line will be increased.

Estimating Copper Losses.

In estimating the copper losses at 50% load factor the "Form Factor" may be taken at 1·17 instead of 1·35, and the R.M.S. current flowing through the transformer and line may be taken at 280 A. The copper loss in the line and transformer will therefore be increased in the ratio of $(280)^2 = (280)^2$ or 1·96. The copper loss in the transformers will therefore be increased to 274 kW, and in the line to nearly 620 kW. The total average power loss involved in the transmission is increased to 1 830 kW and the units lost per annum $= 16 \times 10^6$ Taking a works cost of 0·25d. per unit, the additional cost due to losses is approximately $\frac{1\,600}{435} = 3{\cdot}7\%$ of 0·25d. or 0·00825d. per unit.

The total cost per unit, therefore, for electrical transmission amounts to 0·01792d. per unit, a lower figure than at the lower load factor (0·0243 at 31% L.F.). This result shows that the case for electrical transmission is stronger with an improved load factor, though the actual reduction in the cost of transmission per unit depends on the ratio of capital to running charges. The ratio of capital charges to cost of waste energy in this case, according to Kelvin's Law, is nearly correct, the capital charges amounting to 97% of the cost of the waste energy.

In this case it is interesting to note that although the capital charges are reduced in the ratio of 31 : 50 or 0·62 the cost of the energy losses in the transformers and line are only reduced in the ratio 3·7 : 4·05 or 0·915. Where capital charges are relatively high, an improved load factor will make a substantial reduction in the cost of electrical transmission, whereas with a cheap line and cheap and relatively inefficient transformers there is not much gain from an improved load factor.

A case which has often to be considered is that of the relative cost of obtaining electrical energy from a water power plant and from a steam plant. The position of the water power plant is, of course, fixed, but the position of the steam plant may be varied within considerable limits.

Economical Siting.

As a rule it will be found economical to place the steam plant as near as possible to the electrical centre of gravity of the load which it has to supply, since the difference in cost of transport of fuel to different sites within a radius of a mile or two, as compared with the increase in cost of electrical distribution, involved by displacing the central station from the electrical centre of gravity, is usually negligible. One can assume, therefore, for purposes of comparison that the steam station can be placed close to the centre of gravity of the load, thus reducing the cost of the distributing network to a minimum. With a water power station an overhead transmission line has to be constructed from the power station to the electrical centre of gravity.

Taking the figures given in published tables, the total works cost of generating electrical energy in a steam station such as Barton, Manchester, is 0·6d. per unit and the capital charge for interest and sinking fund 0·41d. per unit. With a 31% load factor, and assuming the interest and sinking fund charges to be 7·6% of the capital expenditure, this corresponds with a capital expenditure per kilowatt of maximum demand of very nearly £61. This figure is, of course, more than double the figure for capital expenditure on the basis of the total plant connected to the various power stations, the actual maximum connections to the mains in Manchester being 351 000 kW, as against 154 000 kW of maximum demand.

With a hydro-electric station, capital has to be expended both at the source of power and in constructing the line. In addition, transformers have to be used to step-up the electrical pressure for transmission, and to step-down at the distributing centre. Apart altogether from the technical difficulties involved in the regulation of pressure along a line of this description, it may be of interest to make a comparison between the cost of generating electrical energy from coal and of obtaining it from a hydro-electric station about 600 miles away, which is approximately the distance of the Victoria Falls from the Rand.

The running charges in a hydro-electric station are, of course, extremely small, and may, as a first approximation, be taken at about 0·1d. per unit for maintenance and labour. It is assumed that the plant capacity installed in the hydro-electric station is the same as that installed in the steam station, the extra losses with the hydro-electric scheme being supplied without requiring additional plant. In addition, the energy wasted in transmission must be allowed for, but since the works cost of a unit is so small, the money value of the energy wasted in the transmission line is relatively small, and if the transmission line is assumed to have an efficiency of 90%, is only equivalent to an increase in works cost to 0·01d. per unit.

Capital Charges.

The total generating cost in a steam station of about 100 000 kW capacity may be taken to be 1d. per unit. (The figure for Barton (Manchester) for January, 1929, is 1·01d. per unit) which leaves available 0·9d. per unit to cover the capital charges on a hydro-electric station. Capitalising this on the basis already assumed, the maximum permissible expenditure with a 31% load factor is £133 per kW of maximum demand. For a 600 mile line the total cost (assuming the cost to be £3 000 per mile) will amount to £1 800 000, to which must be added the cost of transformers and switchgear, which will bring the total to roughly £1 950 000.

The maximum load is 100 000 kW, and this corresponds with a capital expenditure of £19·5 per kW, which leaves available for necessary engineering works at the hydro-electric power house a total of approximately £113·5 per kW. This figure will have to be reduced by at least 30% to allow for spare plant at the power house, and therefore a capital expenditure of £80 per kW of plant installed may be taken as the maximum permissible. This figure corresponds fairly closely with that given by the Electricity Commissioners for the maximum capital expenditure which is permissible on the development of a small hydro-electric plant in England.

No attempt has been made in this paper to deal with the question of regulation on such a long line. When the late

Digitized by Google

Prof. Ayrton delivered a lecture at the last meeting of the British Association in South Africa he advocated the use of the Thury series system in order to get rid of the difficulties due to charging current and inductive drop, and to reduce the cost of the line. Since that time great developments have been made in long distance transmission with alternating currents, and such lines are now in operation over distances up to 350 miles. There is no insuperable difficulty in designing an overhead transmission line which will operate over this distance.

Another scheme was put forward by Steinmetz some years ago which he called "quarter-wave transmission," in which the transmission is from constant current at the transmitting end to constant pressure at the receiving end. This scheme has never been used on a large scale, although one sees it in practice with very high frequency in an ordinary wireless transmitting aerial, which is a quarter-wave transmission working at no load.

It is interesting to note that the length of a quarter-wave transmission line working at 60 cycles, and made of wire of 0·706 in. dia., is very nearly 700 miles, and therefore it should be practicable, by using suitable "loading," to instal quarter transmission on a 600 mile line, and to maintain constant pressure at the receiving end by controlling the generators at the sending end for constant current.

It is not beyond the bounds of possibility that if the cost of fuel in South Africa increases, and if the load factor of the Rand is improved, the exploitation of the Victoria Falls for the supply of power to the gold mines on the Rand may be economically feasible.

RECENT ELECTRICAL PROGRESS IN INDIA.*

Electrified Industries—Railway Electrification—Compulsory Electric Headlights for Steam Locomotives?—The Radio Position.

By A. T. COOPER, M.Inst. C.E., M.I.Mech.E., M.I.E.E., M.Cons.E.

(*Concluded from page* 141).

OUTSIDE the chief centres of population, which have already been dealt with, there are a few instances in which local conditions with regard to raw material have led to the establishment of isolated cases of mechanised industry, the outstanding example of which is the Tata Iron and Steel Co. Situated at Jamshedpur, about 150 miles to the west of Calcutta, and built upon a site on which 20 years ago stood the village of Sakchi in the primeval jungle, the works of this important company are electrically self-contained, and own two steam power stations, having capacities of 11 750 and 25 000 kW respectively. An 18 000 kW set is shortly to be installed in the larger station, and the smaller will then be shut down, leaving a single station of 38 000 kW capacity.

Power is transmitted overhead at 3 000 V 3-phase, 50 cycles, and is used for many purposes in the manufacture and refining of steel. The annual demand is 150 million units a year, about the same as that of the city of Calcutta. Over 100,000 H.P. of motors are installed, the largest being 6 500 H.P. About one-third of this horse power consists of direct current motors, for speed control reasons, the conversion from alternating current being carried out by fly-wheel motor-generators in the case of supply to the large reversing mills, and by ordinary motor generators for the smaller motor circuits.

COLLIERY ELECTRIFICATION.—The application of electricity to coal mining in India is slowly gaining ground, as is shown in the following official statistics of electric motors installed:—

	1924.	1925.	1926.	1927.
H.P. on surface	13 564	15 501	16 192	16 440
H.P. below ground	29 938	36 835	38 356	43 099
Total H.P.	43 502	52 336	54 548	59 539

The use of electrically driven coal cutters has not been developed to any great extent, the number in use having only increased from 109 in 1924 to 124 in 1927, about equal numbers of the American chain and the British bar type being employed.

Although many Indian coal mines have their own power plants, colliery supply undertakings have been formed in certain areas.

ELECTRIC TRACTION.—Electric tramways have been in operation in the principal cities of India for many years, but the application of electric traction to railways has been somewhat backward, for although the electrification of the suburban sections of the two railways running out of Bombay city was investigated as far back as 1912, it was not until 1922 that sanction was given to the first electrification scheme, that of the suburban section of the G.I.P. Railway over which the first electric trains were run in February, 1925. In September of that year the Indian Railway Board sanctioned the electrification of the main line routes on that railway out as far as Igatpuri and Poona, thus making, with the suburban section, a total of about 300 miles of electrified track.

In 1923 sanction was given in connection with the suburban section of the B.B. and C.I. Railway out as far as Borivli, but owing mainly to the coal strike in this country it was not until January of last year that the electrified service came into operation.

With regard to other Indian Railways, the electrification of the suburban section of the South Indian between Madras Beach and Tambaram has been sanctioned, and propositions in respect of certain main line sections of that railway have been put forward, but so far no decision has been arrived at.

With regard to the Calcutta suburban lines, electrification has been considered, but in view of the heavy expenditure involved the matter has been referred back for further investigation.

Auxiliary Railway Uses.

For many years progressive use of electricity has been made by the railways of India for train lighting, workshop driving, welding, pumping, crane and capstan operation and so forth, and perhaps the only recent application which, in view of its interesting nature, calls for record, is the general application of electric headlights to steam locomotives. About 85% of the steam locomotives have so far been fitted, and the Railway Board are considering the advisability of making such headlights compulsory.

The generator for the supply of electrical energy must, of necessity, be located on the locomotive itself, and it takes the form of a 32 V 500 W steam turbine-driven set which is bracketed off the side of the boiler. There are several types, with both alternating and direct current generators, but the British product introduced a couple of years ago is a turbo-alternator of outstanding simplicity.

A single wheel steam turbine drives an inductor type of alternator, having a toothed rotor without windings of any sort and a stator consisting of permanent magnets with laminated pole-tips carrying only two small fixed coils embedded therein. There is consequently no commutator or collector. The permanent magnets require remagnetising at infrequent intervals, but electro-magnets are provided for this purpose as part of the standard equipment.

Only 250 W, i.e., half the output of the turbo-alternator, is taken by the actual headlight, the other half being applied for lighting the cab, gauges, lubricators and tender, while a portable lamp can be plugged in for inspection purposes.

BROADCASTING.—Concluding with this latest example electrical application, wireless broadcasting came into operation in 1927 through the medium of stations in Calcutta 7CA (370·4 metres) and Bombay 7BY (357·1 metres) operated by the Indian Broadcasting Co., a subsidiary of the Indian Radio Telegraph Co. These stations, although of the same transmitting power as 2LO, viz., 3 kW, have been found under Indian climatic conditions to possess much greater transmitting ranges, and regular reception is reported from the North-West provinces, from Ceylon, and even from the Malay States 1 800 miles away.

So far broadcasting has not captured the imagination of the Indian public to a degree sufficient to make it a financial success, but the company are of the opinion that if they are patient and keep a good service going they will eventually obtain the necessary number of licence holders, which is at present less than 10 000. Should financial success be ultimately achieved, additional transmitting stations will no doubt be installed at such centres as Delhi and Madras.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Southern Railway Electrification Schemes."

[To the Editor.]

Sir,—The suggestion of Mr. J. G. B. Sams in your issue of July 26th that the traffic to Charing Cross should be diverted to Victoria and St. Paul's is entirely wrong, and would be a worse blunder than the proposal to move Charing Cross Station to the south side of the river.

From the standpoint of facilitation of traffic, instead of removing the most convenient terminus in London to an inconvenient position the object should be, if practicable, to bring the terminal stations nearer to the localities which people desire to reach. For instance, consider the enormous improvement in traffic facilities that would occur if it were possible to place Waterloo Station in Trafalgar Square!

The value of the proposed Charing Cross road bridge will be largely discounted by the great number of vehicles necessary to carry over the river the passengers who are now brought by train.—I am, etc.,

H. C. Silver.

Wallington,

Reviving the Electric Vehicle.

[To the Editor.]

Sir,—It sometimes happens that knotty problems are solved when somebody has the courage to make an attempt at their solution. It should not be difficult for supply authorities to hire or hire-purchase to the hotels and café-garages in their areas suitable plant for charging electric vehicle batteries. The traveller would willingly stop for lunch or tea while his or her car was replenished with silent, safe, smokeless, smellless fuel for the next lap. It ought to be possible to supply current for a demand of this nature at such a price as might show a saving on the old running costs sufficient to pay for the meal. Liquid refreshments for the battery would be supplied from the disused petrol pump.

An automatic slot machine charger for unattended stations is not impossible.—I am, etc.,

"Lectrobus."

BOOK REVIEW.

Practical Geometry and Engineering Graphics. By W. Abbott. (London: Blackie and Son.) Pp. 304. 10s. net.

This text-book for engineering students is designed to provide a course in practical geometry for those who have already received some instruction in elementary plane geometry, graph plotting, and the use of vectors. In view of the difficulties in the way of a logical treatment of the subject, the author has departed from the usual procedure, and has grouped plane geometry in Part I and solid or descriptive geometry in Part II, with the intention that the two parts should be read concurrently.

Systematic use is made of auxiliary projections in the solution of problems, and though this method has not been much used, the author rightly holds that with its aid many standard problems become merely exercises involving a knowledge of a few fundamental constructions.

The book is well planned, the subject matter on each page being self-contained, and arranged so that the text and corresponding diagrams are always adjacent to each other, while cross reference is facilitated by the use of a consistent notation throughout.

Most of the 600 examples are original, and types having little but their difficulty to recommend them have been excluded. Answers are given to a large number of the examples and, in the geometry portion, many of the answers are designed to serve simply as checks upon the accuracy of the constructions involved. C. H.

THE FACTORIES REPORT.

Fewer Electrical Accidents than 15 Years Ago in Spite of Increased Application of Power Drive—Seven Fatalities on H.T. Systems—Fatal Accidents for Year Number 26—Outdoor Sub-Station Designs Compared.

IN the annual report of H.M. Inspector of Factories and Workshops for the year 1928 (Cmd. 3360: H.M. Stationery Office, 2s. 6d. net) it is pointed out by Mr. G. Scott Ram, the senior electrical inspector, that the number of reportable accidents notified during the year was 427, including 26 fatal cases, as against 372 with 27 fatal in 1927. In addition 34 others were notified, including 6 fatal cases, which on investigation proved to be non-reportable. The increase of 55 accidents, or 15%, is of no special significance, seeing that the number has been exceeded in several previous years, and is actually less than it was 15 years ago, in spite of the enormously increased use of electricity during that period..

Thirty-four accidents, including 7 fatal cases, occurred on h.t. systems. Twenty-three of them, including all the fatal cases, occurred in stations of public supply or traction undertakings. In one of them a junior switchboard attendant in a power house on his own initiative opened a switch cell which he must have known to be live, presumably in order to trace certain connections in reference to some work which had to be done the next morning, when the conductors would be made dead. He apparently touched a live conductor, 11 000 V, with his knee whilst his head was resting on an earthed angle iron support. A very similar fatality occurred to an electrical fitter, aged 23, at a rotary sub-station. He was in the employ of a firm of electrical manufacturers who had a contract for the extension of a 6 600 V switchboard. Two new panels had been added, and he wished to see into the adjacent live panel in order to decide what would be necessary for him to prepare in order to connect up the new panels later on. He was not in charge of the job, the head erector being away, but he was regarded as competent. At his request the sub-station engineer opened the door of the panel. He had to stand on a block of wood in order to see what he wanted and whether he slipped, or in peering in got too close to the live conductors, is not known.

Both of these accidents show the necessity for constant supervision by the station staff over contractors' workmen if there are live conductors in any way accessible to them.

Accidents at 33 000 V.

Among other instances mentioned by Mr. Scott Ram may be included two fatalities which occurred at outdoor sub-stations on 33 000 V systems, in both cases to contractors' workmen. In one case a set of the outdoor circuit breakers was being overhauled, having been made dead for the purpose. On either side some 10 feet away the adjacent circuit breakers were in use and live. One of the men who had been engaged on the work in the morning on returning after the dinner interval inadvertently climbed up the adjacent live circuit breaker. In the other case, work had been carried out on a part of the switchgear during the day, a certificate to the effect that part of the gear had been made dead for working on having been previously handed to the men by the engineer of the undertaking. During the night that part of the switchgear had been put in use. The next day a similar certificate was handed to the men, but the parts made dead were not entirely the same, and hence the accident. The men undoubtedly relied on the conditions being the same as on the previous day, but on the other hand they could have seen that this was not the case had they looked, as the isolating switches concerned were adjacent to the work and easily within view.

Two other fatal high-tension accidents were investigated, but were found to be non-reportable. Both occurred to men when painting poles carrying live overhead lines (10 000 and 3 000 V).

Of the non-fatal high-tension accidents at switchboards, several were due to mistakes on the part of authorised persons in thinking that certain switches were dead when they were not, or in opening the wrong doors. Three accidents were due to the explosion of oil switches.

Six high-tension accidents occurred in the testing departments of electrical manufacturing works, fortunately without loss of life. Two were due to mistakes in the "all clear" signals, one to unauthorised entry into the danger zone, and one to an inexcusable and dangerous practice of permitting workers to remain within the danger zone whilst the tests were in progress.

Of the low pressure and medium pressure accidents 40 (two fatal) occurred to men working at live switchboards. In many of the cases there was no need to have carried on the work whilst the boards were live, and in others no precautions were taken as by the use of screens, insulated tools, etc. The injuries were mostly from short circuits causing burns, in some cases very severe.

Other Cases.

Twenty-five accidents (one fatal) occurred to men working on or near live conductors other than at switchboards. The fatal case was due to the use of conductors protected by braiding only. Fifty-two occurred at motor control panels and other switches. Twenty-two occurred in the renewing of fuses, mostly due to faulty construction, necessitating the exposure of live metal. Sixteen accidents occurred at motors, two of them being fatal. One of these was due to the earth wire having been broken and the motor frame becoming live, and the other to the attendant after having switched on the stator of a three-phase motor attempting to adjust the bushes on the slip rings, the motor being at rest.

Thirty-seven accidents from shock, including three fatal cases, occurred in the handling of portable apparatus, and were mostly due to non-earthing; 16 concerned electric drills and other tools, and 11 handlamps. Of the fatal cases one was with a portable drill, the earthing wire in the flexible having become broken. Two were due to the use of ordinary brass lampholders, unearthed, as portable lamps. Fatalities from this cause occur every year, and will probably continue to do so on account of the ease with which such a portable lamp can be improvised by anyone having a very slight electrical knowledge. Flexible conductors and connectors for portable apparatus accounted for 54 accidents, including one fatal. Twelve were due to the use of "adaptors" or other unsuitable types of connector plugs; 26 to the use of inferior type or damaged flexible conductors. The fatal case was due to carelessness or ignorance on the part of a firm of engineers in sending out a gang of men to do some work, involving the drilling of a number of small holes, by means of electric drills not provided with properly constructed connectors.

Thirty-seven accidents, 5 fatal, occurred at cranes or hoists. Eight, including 4 of the fatal cases, were due to absence of or faulty earthing. Twenty accidents, one fatal, occurred to people coming into contact with live trolley wires of cranes on other travelling machines.

Thirty-one accidents, two fatal, were due to inadequately protected conductors. One of the fatal cases occurred in a building under construction, where the conditions made it difficult to provide proper protection. The other was in a boiler house, where some old wiring, although no longer required, had not been disconnected. Ten cases of eye flash from arc welding were reported.

Amongst the miscellaneous accidents were two fatal cases. In one, during some structural alterations to a factory, a girder was being lowered by means of a steel rope and a winch, when it swung against some power wires, cutting through the insulation. The man working the winch was killed.

Mistakes in Wiring.

In previous reports fatal accidents due to tumbler switches being connected in the neutral conductor instead of the phase wire have been described, a mistake frequently made by the careless wireman. One accident due to this cause is worth recording. An electrician was engaged in overhauling electric radiators in the offices of a large works. A bowl fire connected and earthed by 3-core cable and a 3-pin plug was controlled by a single-pole tumbler switch. He wanted to remove the heating element, and took hold of it for that purpose. The switch being in the wrong wire, he received a shock, and was unable to let go. He called out to a girl near by to turn off the switch. As the switch was already "off," the effect of turning it was to put it "on," with the result that the element heated up, and he was still unable to let go. Another girl fortunately pulled out the plug, and he escaped with severe burns to his hand. This accident occurred at a factory where the electrical work is very well done. It was subsequently found that out of a large number this was the only switch

Digitized by Google

connected in the wrong wire. The provision of double-pole instead of single-pole switches is the only sure way of guarding against accidents through such mistakes in wiring.

Of the four non-reportable low-tension fatal accidents investigated (not included in the table), one was at a factory premises which had not been working for two years. The supply was still connected up to the service fuse box, the fuses having been taken out. Some youths were stealing cable,

*Shock and fall.
† Two cases shock and fall.

and having removed three pieces connected to the dead side of the fuse box, proceeded to deal with those on the supply side, one of them being killed.

Eleven prosecutions were taken during the year. Convictions with fines ranging from £1 to £30 were obtained in nine cases, whilst two were dismissed. One case was noteworthy in that it was taken against an employee, a sub-station attendant, the "authorised person" in charge, for permitting a contractor's workman to carry out some work in a 20 000 V switchboard cubicle whilst some of the conductors were live and unprotected.

Mr. Swann compares types of outdoor sub-stations in his area. In some the designers do not appear to have realised the requirements of the Regulations as regards safety in operation in such necessary work as in the renewal of fuses. In others which deal with a duplicate supply and are arranged with hospital bars or other by-pass to allow of an oil switch or other apparatus being worked upon without shutting down more than a small portion of the station, and where the type of switchgear does not lend itself to segregation by means of screens or divisions, the alternative of adequate spacing has been overlooked. As a rule there is no difficulty in obtaining the necessary elbow room in these outdoor or similar sub-stations.

In some cases, precautions which are taken as a matter of course in indoor sub-stations are omitted altogether in the outdoor type, involving much greater danger, when it is realised that an attendant may have to carry on his work at night in semi-darkness or in a gale of wind and rain. It is, of course, necessary and desirable that the cost of such sub-stations should be kept as low as possible, but the collecting together of apparatus in an haphazard manner is not the way to achieve the required result. A little thought beforehand from the point of view of the man who later on has to work the station would often secure safety without in any way adding to the cost. In this connection Mr. Brown (Midland Area) points out that a great deal of the apparatus put on the market demonstrates a complete lack of practical operating experience on the part of the designers. Operations which may appear to be quite practicable and easy when performed mentally on a drawing board, or actually on the workshop floor, are probably very different propositions when executed at night in a gale when standing on a ladder or on climbing irons on a snow-covered pole. The majority of troubles on outdoor equipment are experienced in bad weather, which point should be borne in mind by those designing such apparatus. In a great many instances the arrangement of isolators and fuses is unsatisfactory, there being insufficient clearance between the fuse and the live contacts of the isolating switches to permit of an operator renewing the fuses with safety.

When a sub-station is of sufficient capacity to require the use of oil-filled switchgear, it seems doubtful if the use of a completely outdoor sub-station is the best arrangement. Mr. Brown refers to one large undertaking which experienced so much trouble last winter with this type of sub-station that it is superseding it with sub-stations having switchgear within buildings whilst retaining the outdoor transformer equipment.

Mr. Preston (Western Area) refers to a similar development in his area, tending to supersede the popular arrangement of kiosk sub-stations in which the transformer and switchgear of indoor type are within a sheet metal enclosure, but arranged to be operated from outside, there being no space for the entry of an attendant. Preference is now being shown for brick buildings to accommodate the switchgear and having space for operation from within where the attendant is sheltered from the weather, the transformers being of outdoor type placed outside the building. Amongst other matters he also refers to the use of electricity in building operations and to the risk in the use of a.c. at standard voltages for temporary working of lighting and use for drills and other electrically-driven portable tools.

Mr. McColgan (Northern Division), after describing several new stations and new extensions in his area, refers to the large amount of power generated on factory premises such as steel works and paper mills, the capacity of some being greater than many public supply undertakings. One under construction will be of 100 000 kVA capacity. In this connection Mr. Swann recently reported on a paper mill plant turning out two hundred million units a year. Mr. McColgan mentions one large town where they have completed the scrapping of a number of very unsatisfactory underground sub-stations, having replaced them by above-ground stations of modern design. He also refers, however, to the difficulties experienced in certain crowded cities in finding overground sites for sub-stations, even large ones having to be placed underground, calling for special treatment as regards ventilation, drainage and means of escape in case of fire or switch explosion or other trouble.

Mr. Swann, in particular, has had much special work during the year in reference to electrical plant for use in inflammable surroundings, e.g., for cellulose enamel processes, petrol washes in certain trades, dry cleaning, rubber spreading, in certain processes in artificial silk manufacture. In the early part of the year he was much taken up with the details of electrical plant under the Regulations for Celluloid Film Printing. New designs of high-frequency steel furnaces have required attention, whilst there has been considerable activity in equipping new electrically-operated coke ovens requiring special consideration.

THE WEST HAM UNDERTAKING.

Expectations of a Record Year—Views on the Doctrine of Rate Aid.

"THE net result of a profit of £18 161, after meeting all charges, must be considered a magnificent one, taking into account the substantial reductions made in the charges for supply," states the West Ham Electricity Department in the report for the year ended March 31st. "The average reduction last year," it continues, "amounted to no less than 0·12d. per unit, and represents no less a sum than £45 393 on the total units sold, so that had no reduction been made the profit would have been a total of £63 554, an unnecessarily high figure in view of the strong financial position of the department.

"Even the good results obtained would have been better but for a slump in trade during the first six months in the year. A welcome recovery took place in the latter part of the year, and this is being steadily maintained, and the figures up to date point to another record being set up during the current year."

Figures are given to show that the total benefit to the rates had been increased from £35 139 to £48 344. "One is well aware," adds the report, "of the old cry of loans being raised on the security of rates; but the fact is always overlooked that the consumers of electricity are making a handsome present to the ratepayers in the shape of the assets of the undertaking, which could be disposed of at any time and a handsome profit realised.

"It is therefore difficult to appreciate why the rates should be subsidised to benefit such ratepayers as the railway companies and gas companies, who take all the benefit of the department and do not assist it in return. If all the ratepayers were consumers of the department there might be something to be said for 'rate aid,' but otherwise it is a very vicious doctrine and a hindrance to progress and development."

TESTING the genuiness of sapphires is the latest use to which the Coolidge tube has been put.

A site for the erection of a sub-station has been secured in Avonmore Road by Fulham B.C.

The tenth annual report of the Women's Engineering Society records an increasing membership.

The Commissioners of H.M. Works, etc., invite tenders for alterations and additions to the Post Office and Telephone Exchange at West Bromwich.

Messrs. Lever Brothers are introducing electric light into their houses at Port Sunlight in place of gas.

Sixty employees of the Darlington Rise Carr Rolling Mills were last week rendered idle when a black cat trod on a live cable and shut down the works.

Members of the Skircoat Ward group of the Halifax Labour Party, numbering between 60 and 70, paid a visit on July 27th to the Halifax electricity works.

An "electric vibratory chair" is the latest addition to the police gymnasium of Pittsburg. It has been designed for the purpose of keeping the city's police staff and firemen fit.

According to the President of the Winnipeg Electric Railway Co., power from the Seven Sisters Falls plant of the North-western Power Co., Ltd., a subsidiary of the concern named, will be available by the end of 1930.

An announcement has been made at Toronto of the completion of the new storage dam being constructed by the Ontario Hydro-Electric Power Commission at Ear Falls, on the English River, in the north-western portion of the Province. Progress is also reported on the construction of the power house, where 3 500 H.P. is to be developed for transmission to mining districts in the Red Woman and Narrow Lake fields in the Patricia district.

Street lighting by electricity is to be adopted at Littleover.

Salt Lake City is discarding tramcars in favour of trolley buses.

The question of substituting electric lighting for gas at Newark Institution has been deferred.

The French Postmaster-General has brought forward a Bill which will authorise the necessary credits for the provision of a radio-telephone system between France and Indo-China. It is proposed to erect a station at Pontoise. It is hoped to commence the service in November.

The Canadian Hydro-Electric Corporation, Ltd. is about to erect at Hawkesbury, Ontario, a new transformer station costing approximately $200 000.

The Mayor of Bridport, Ald. A. Spiller, on July 26th, laid the foundation stone of the power station which is to be erected in connection with the electricity scheme.

Brentford Board of Guardians has placed a contract, amounting to £36 284, for the erection of an electrical and X-ray department and wards at the West Middlesex Hospital, Isleworth.

The August issue of the "Siemens Magazine" contains, among other articles, one giving a brief description of the window in Westminster Abbey erected to the memory of Sir William Siemens.

Westminster City Council has decided to ask the Minister of Health to receive a deputation from the Council, the borough councils of Chelsea, Kensington and Fulham, and the Dean and Chapter of Westminster, respecting the erection of Battersea power station.

Over six months before the opening of the next British Industries Fair, only 5% of the total exhibition space in the enlarged Olympia, where the London section of the Fair is to be held from February 17th to 28th, remains unlet. In some trade sections there is no room left at all.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of August 9th, 1879, recorded that:*

Naval officers undergoing torpedo inspection were required "to familiarise themselves with the practical application of electricity to the art of war."

A leading article dealt with a surprising claim by an American to have invented what we now call television. The inventor, it appeared, had as part of his apparatus, a small mirror, over which a curtain was hung. He announced his intention to establish contact with a colleague in another part of the town. The cloth being removed, the observer saw in the mirror the features of an unknown person, and it was explained that the features were those of the distant colleague. The latter was then told to transmit a representation of the room in which he was working, and immediately the picture in the glass gave place to one of a room the furnishings of which were clearly distinguishable. The question which headed our article: "Is it a Hoax?" suggests the reception which was accorded to the story.

* * *

TWENTY-FIVE years ago, according to THE ELECTRICIAN *dated August 12th, 1904:*

Experiments were being made at Lecce, Italy, in assisting the germination of seedlings by the aid of electricity.

W. T. Glover and Co. introduced an ingenious method for transmitting designs and sketches by telephone by means of special squared charts.

* * *

FIFTEEN years ago it was stated in THE ELECTRICIAN *for August 7th, 1914, that:*

The I.E.E. was asked to open a register of members willing to take temporary Government service in connection with the War.

It was deemed expedient that the Government should have control of the transmission of messages by wireless telegraphy. Instructions were also issued for the closing of all experimental wireless telegraph stations in this country.

The bank rate rose to 6%. It is interesting to note that it was increased from 3 to 4% on July 30th.

The accounts of York Corporation electricity department for the year show a net profit of £28 928, of which £3 450 is to be devoted to rate relief. The net profit the previous year was £30 000.

The New England Power Association, controlled by the International Hydro-Electric System, a division of the International Paper and Power Co., produced 137 688 000 kWh of electric energy in June, an increase of 25% over the output of the association in June, 1928, and 61% over that of June, 1927.

The statue of Liberty in New York harbour has been fitted with a 1 500 W lamp in place of the previous 1 000 W, and the 500 W lamps have been changed for lamps of 750 W. So bright is the illumination that it has been necessary to advise shipping and aircraft in order to avoid errors in local navigation.

As a result of the deliberations of the Telephone Committee at the Amsterdam Conference of the International Chamber of Commerce, the "person to person" call will become operative in European international telephony between England and seventeen other countries on October 1st. Switzerland has refused to be a party to the arrangement and two other countries have yet to decide.

A hitch has evidently arisen in the negotiations for the transfer of the undertaking of the Gayton Park Electricity Co., Ltd., to Birkenhead Corporation. It was reported to the Birkenhead T.C. last week that the proposed transfer price was £500, but the decision would have to be further reconsidered.

At a conference of London rating authorities it was decided that modifications in special cases, not exceeding 7½% of the capital value of rateable machinery be taken as the maximum percentage for gross value and that the maximum deduction of one-third should not be allowed as a matter of course, but the amount should vary between one-third and the normal scale, according to the proportion of machinery included in the assessment.

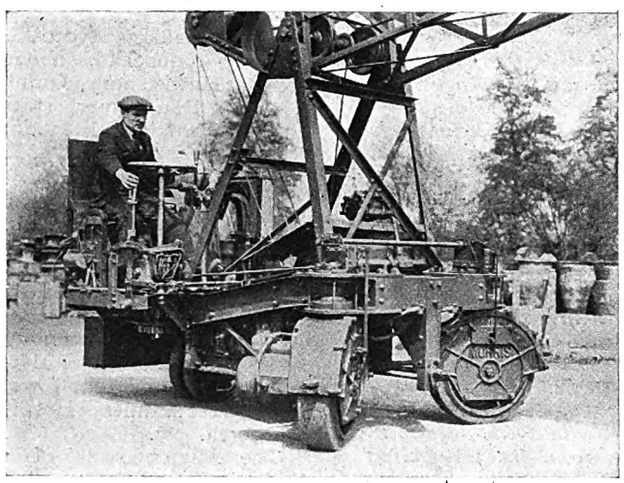
The National Federated Electrical Association points out that at the meeting of the London Disputes Committee held on May 7th last it was agreed that the second part of the "note" under clauses 6 and 7 of the London agreement be cancelled. In the circumstances, therefore, time-and-a-half will not be payable for hours worked on the Tuesday after August Bank Holiday, or, of course, on any other of the five days mentioned in the note.

Digitized by Google

MANUFACTURERS' EQUIPMENT.

Electric Furnace Equipment—Warning Signals for Works and Factories—Portable Jib Cranes—Electric Scaling Apparatus—Isolating Vibration.

A LARGE section of the new Magnet Works at Birmingham has been assigned to the manufacture of industrial heating apparatus. Among the various types of electric ovens and furnaces produced by THE GENERAL ELECTRIC CO., LTD., the "Magnet" muffle furnace may be mentioned. This 8 kW furnace has a chamber 18 in. long, 12 in. wide, and 10 in. high. Its shell is of steel plate reinforced with angles and bolted together with a cast iron front; the legs are of



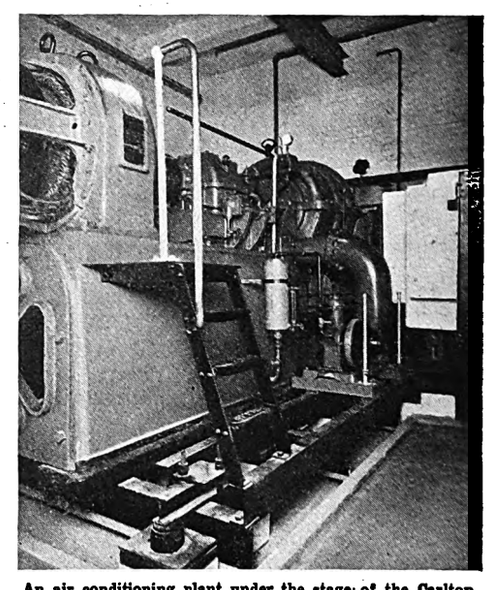
Showing how the front wheels of the "Morris Versatile" crane can be swung into a variety of positions.

angle steel. The door is operated by balanced mechanism controlled by a hand lever at the side, giving easy operation and ensuring that the door is firmly pressed against the furnace front. The muffle is of refractory fireclay and is wound with nickel chrome wire, the arrangement giving an even temperature throughout the length of the muffle. The backing is constructed of insulating bricks, added to which are special magnesia-asbestos slabs. Aluminium paint is used to paint the whole structure; this gives an attractive appearance and also reduces the heat radiation loss. Automatic temperature control equipment, which enables the furnace to maintain any desired temperature to within narrow limits, is supplied as standard. This equipment is mounted on a slate panel board and consists of a "Cambridge" regulator working from a pyrometer in the furnace, together with a sensitive relay instrument transformer, time switch, pilot lamps, push button switch, and switch and fuses for the mains. The time switch can be arranged to be inoperative on any selected day. The mains switchboard has ironclad main switches and fuses; below these is mounted a contactor in steel case, operating from the automatic temperature control relay. A terminal box of sheet steel with perforated metal cover is located at the back of the furnace; a gold excess-temperature fuse is fitted, and is wired into the relay circuit of the main control. This protects both the resistor wire and the furnace charge, if the automatic temperature control fails to operate.

The use of "Klaxon" industrial warning signals is increasing rapidly, according to KLAXON, LTD., of Birmingham, and 36, Blandford Street, London, W.1. It is pointed out that by variation in the duration of the sound, the Klaxon installed in a factory can convey any desired message or warning, while it calls for none of the watchfulness necessary when coloured lights are relied upon for signalling. As a time signal for starting and stopping work, it is claimed to be one of the most effective agents obtainable at a reasonable cost. For calling workers to the office a code signal may be arranged, and when any particular person is wanted the code is sent out, operating all "Attention Klaxons" in the works, so that wherever the wanted man may be he cannot miss the call. It is suggested that in a busy factory even telephone bells should be "Klaxonised." The "Klaxet" is specially designed for telephone use, and is operated by a relay across the bell terminals, which cuts in the signal on a local battery. Installed as an alarm signal at power and similar stations, the "Klaxon" is able to give immediate and unmistakable notice of a breakdown either within the station or at some point on the line. The industrial "Klaxon" motor can be adapted to any reasonable voltage, d.c. or a.c.

The "Morris" versatile crane, manufactured by HERBERT MORRIS, LTD., of Loughborough, is a portable jib crane, stated to provide unique versatility of movement. In addition to manœuvring in the usual way, the new "Morris" crane will perform the following operations: (*a*) change a forward or backward movement into another at right angles to it; (*b*) make any angular change of travelling direction throughout the 360 deg.; (*c*) revolve on its own centre, on a circle whose diameter equals the crane's wheel base. As all wheels, including those which take the drive, are steerable, the crane can be made to rotate round the load, round its centre or round its rear wheel. The 2¼ ton crane will lift a load of 2¼ tons at 5 ft. 6 in. at a speed of 35 ft. per min. It can lift a load of 14 cwt. at a distance of 16 ft. from the front wheel. A 1-ton load can be raised at 40 ft. per min. The travelling speed is about 350 ft. per min. The "Morris" crane is suggested for many purposes, including loading railway wagons, erecting poles, acting as an auxiliary to an overhead crane and shifting scrap steel with an electro-magnet.

ANGELO BROS. (ENGLAND), LTD., 45, St. Mary Axe, London, E.C.3, market a full range of shellacs suitable for all requirements. "Angelobro" shellacs include the following garnet lacs: "A.C.," containing 10% resin; "C. Pure," which is stated to be the most widely used garnet to-day, to contain 1½% resin and 1½% shellac wax, and to have remarkable strength; and "C.5," "C.10," "I.G.," and "Kala," which contain respectively 5, 10, 15, and 20 per cent. resin, and are for use when cheapness is essential. Among orange shellacs is "C.V.T.N.," a new type of shellac, differing from "T.N." in the nature of the wax, which is present in an almost colloidal condition. A typical analysis of "C.V.T.N." is: Insoluble matter, 0·25%; shellac wax, 3·75%; resin, nil; orpiment, nil. The physical and chemical constants of shellac are as follows:—Softening point, 68 deg. C.; melting point, 78 deg. C.; specific gravity, 1·14 to 1·18; specific heat, 0·45; saponification value, 193 average; acid, 63 average; ester, 129 average; iodine (Wijs), 18 average.



An air conditioning plant under the stage of the Carlton Theatre, London, isolated by Christie and Grey supports.

The ELECTRICAL EQUIPMENT AND CARBON CO., of 107-111, New Oxford Street, London, W.C.1, announce the "Devoorde" patent electric scaling equipments for all types of boilers, and tubes and surfaces in general. The "Devoorde" apparatus consists essentially of the motor, the flexible shaft, and the tool heads. The motors are fitted in a hexagonal box—which also contains all electrical fittings—of such a size that it will pass through all standard manholes. In some cases the motor is mounted on a trolley; in others, it can be arranged for vertical running, in which event it is suspended by means of a bracket and eye bolt from any convenient girder or beam. The flexible shaft varies in diameter from ⅜ in. to 1⅛ in., according to the nature of the work. It is pointed out that the "Devoorde" tools do not mill or grind, but have a vibrating, and yet elastic, action, so that they cannot damage the surface that is being treated. Rotary brushes, for instance, have been brought to the point

Digitized by Google

where it is possible to remove a gummed label from tin boxes without any attack on the metal. The machine is made in various models, designed for surface cleaning, rust removing, tube cleaning, etc.

HENRY WIGGIN AND CO., LTD., of Wiggin Street, Birmingham, and Imperial Chemical House, Millbank, London, S.W.1, manufacture the three standard resistance alloys, "Brightray," "Glowray," and "Ferry," in the form of sheet, wire and ribbon. "Brightray" is a nickel-chromium alloy. Owing to its relative freedom from impurities, it is capable of withstanding temperatures up to 1 100 deg. C. "Brightray" is usually supplied in an oxidised condition, the film of oxide protecting the material at high temperatures from collapse by overload. Each coil is said to be carefully tested for overload prior to despatch. "Glowray" is a nickel-chromium-iron alloy containing these substances in the proportion of 65%, 15%, and 20%. It is similar to "Brightray," but is designed for temperatures up to 850 deg.C. only. It is suitable for laundry irons, kettles and toasters, whereas "Brightray" is used for furnaces, fires and cookers. "Ferry," which is known on the continent as "Constanton," is an alloy of copper and nickel with a practically zero temperature co-efficient. It is used for motor starters, instrument shunts, field regulator resistances and cinematograph resistances. The principal physical properties of these alloys are given below :—

	"BRIGHTRAY" 80/20 Nickel-Chromium	"GLOWRAY" Nickel-Chromium-Iron.	"FERRY" Copper-Nickel.
Composition			
Specific Resistance. Microhms per cm^3	103	106	48
Specific Gravity	8·35	8·27	8·92
Temperature Co-efficient 20 deg. to 200 deg. C. per 1 deg. C.	·000097	·000202	·000022
Co-efficient of Expansion 20 deg. to 100 deg. C. per 1 deg. C.	·0000125	·0000125	·0000137
Tensile Strength in tons per sq. in. ..	59	47	39
Specific Heat	0·106	0·112	0·098
Resistance Compared with Copper ..	60·05	61·8	28
Melting Point °C.	1375	1400	1250

Factory designers and those owning buildings where noise proves objectionable to near-by residents will be glad to be reminded of the services of W. CHRISTIE AND GREY, LTD., 4, Lloyd's Avenue, London, E.C.3. This firm specialises in the isolation of vibration and resulting noise, and has many ingenious methods for application to already completed factories, power stations and individual machines as well as for incorporation in new structures. When a machine is operating, two sets of vibrations can be distinguished by instruments; the primary air vibrations, communicated directly by the machine, and the secondary air vibrations, due to the vibration of the machine's foundation. When the secondary vibrations are eliminated, noise caused by the machine is confined to the room in which it is working. This elimination can be effected by either using a specially designed foundation or isolating the machine from its foundation. A combination of these ways of treatment is frequently employed, vibrations being absorbed partly by elasticity of the devices supporting the machine and partly by the specially large mass of the main block. Messrs. Christie and Grey particularly consider the effects of unbalanced forces and correct distribution of the masses. When spring-isolated foundations are chosen, each installation has to be dealt with independently, owing to variations in local conditions; even when engine characteristics are identical, a slight change in the subsoil may alter entirely the measures to be taken. With spring isolation applied to power plants the compression of each spring is made adjustable, so that the periodicity of the foundation system can be controlled in all directions, thus avoiding all resonance between the engine and its foundation block.

Foundations may also be isolated by "Coresil" patent foundation plates, which are made up to a maximum size of 18 sq. ft. each, and are in most cases 2½ in. thick. These plates are made of specially treated cork, cut into strips and arranged in iron frames. The "Coresil" plates are laid side by side and end to end upon a lower slab of concrete, and the main concrete block is built on thin sheet felt laid over the plates.

For isolating machines from their supports self-contained units known as "anti-vibrators" are often used; the internal design of these is varied to suit particular installations. The two principal types manufactured are the "Pedestal" type and the "Bridge" type. An example of the application of anti-vibrators is found in a ferro-concrete building where two motor generators on the first floor transmitted aggravating noise throughout the building: the trouble was stopped by fitting eight anti-vibrators under each machine.

The accompanying illustration shows an air conditioning plant under the stage of the Carlton Theatre, London.

PERSONAL.

FELIXSTOWE B.C. has appointed Mr. A. J. Waring as borough electrical engineer.

The marriage of Mr. Robert St. George Terry and Miss Winifred Marie Tulett was solemnised at New Malden, on July 20th.

At the Royal London Yacht Club's regatta at Cowes on Monday, Mr. J. S. Highfield's "Dorina" was the winner of the handicap for yachts over 40 tons but not exceeding 110 tons.

Sir Hugo Hirst's colt Diolite, which won the Molcombe Stakes at Goodwood last Friday, is being freely spoken of in racing circles as a possible winner of next year's Derby.

Blackpool T.C. has agreed to increase the salary of the resident engineer in the Tramways Department, Mr. F. W. Field, to £700 per annum.

Mr. Brinley John has gained the Glamorgan Open County Electrical Engineering Scholarship tenable for three years at the Cardiff University. He is at present in charge of the electrical plant at Bedwas colliery.

An increase of salary from £1 250 to £1 600 for Mr. Charles Furness, electrical engineer and tramways manager, Blackpool, with increases to officials in the same department has been considered by the Corporation Purposes Committee. The advance to Mr. Furness was carried by a small majority.

Liverpool City Council last week voted to Mr. P. J. Robinson, city electrical engineer, the sum of £700 per annum for not exceeding two years, out of such engineering fees that will be incurred during the erection of the new Clarence Dock station.

Mr. H. McNaul, electrical engineer to Gellygaer U.D.C. for nearly ten years, has resigned that position, having accepted an appointment in the Midlands. He was presented with a fitted travelling case and smoker's cabinet on the occasion of his leaving Bargoed and Mrs. McNaul was presented with a set of silver entrée dishes.

The current I.M.E.A. "Report to Members," in congratulating Mr. F. W. Purse on his appointment as chief engineer to the London and Home Counties Joint Electricity Authority, recalls that in addition to filling the office of President in 1928, he has been a member of the Council of the Association for 21 years, and chairman of the Law and Emergency Committee for four years.

Mr. S. E. Fedden, who recently resigned his position as city electrical engineer of Sheffield to become district engineer for the Mid-East England Electricity Scheme, has been elected an honorary member of the I.M.E.A. In the Lord Mayor's parlour at the Town Hall, Sheffield, on July 31st, the Lord Mayor, Ald. H. Bolton, presented to Mr. Fedden, an illuminated copy of the resolution of Sheffield Council expressing appreciation of his services.

The marriage of Mr. Hugh Buchanan Campbell, technical assistant at the central power station, Ipswich, and only son of Mr. H. M. Campbell, electrical engineer, of Oxford Lodge, Oxford Road, Colchester, and Miss Kathleen Lucy Milliken, was solemnised at the Church of St. Mary-at-the-Wells, Colchester, on July 22nd. The bridegroom received a canteen of cutlery from the staff of the electricity supply and transport department of the Ipswich Corporation.

Obituary.

MR. J. P. THOMPSON, on July 30th, engineer and manager of the Fife Electric Power Co.

MR. KARL AUER RITTER VON WELSBACH, on August 4th, aged 70 years. He invented among other things the osmium filament lamp, in 1897.

MR. EMILE BERLINER, aged 78 years. Soon after his migration to the United States from Germany in 1870 he was attracted by the possibility of transmitting speech by telegraph wire. He set to work, using for a receiver an apparatus as shown in the Bell patent of 1876. In 1878 he joined the Bell Telephone Co. In 1881 he paid a visit to Europe and laid the foundation for a telephone factory in Hanover. After considerable discussion between Edison, the U.S. Patent Office, and others about the priority of invention of loose contact transmission Berliner was granted complete letters patent for this principle. Other inventions of electrical interest were his molecularium and secondary battery. Berliner was also the first (1877) to discover that an electric contact connected to a membrane would act as a reproducing telephone instead of a Bell instrument.

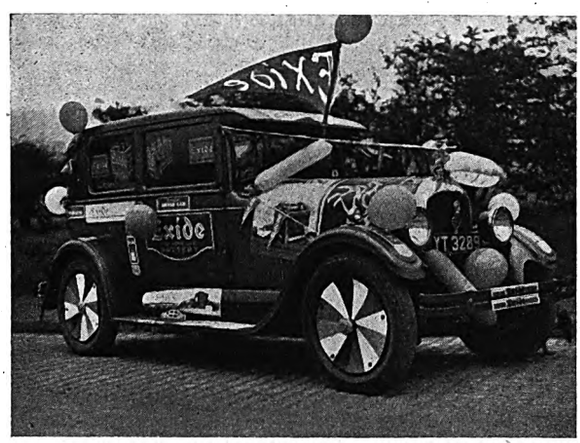
BUSINESS ITEMS.

THE TAUNTON WIRELESS AND ELECTRICAL CO. has opened premises at 2, The Bridge, Taunton.

The RANSOMES, SIMS AND JEFFERIES' electric lawn mower "Electra" was awarded a gold medal at the recent Wolverhampton Floral Fete.



THE "Paige" saloon of Mr. R. H. Jackson which was awarded second prize in the class for decorated cars at the recent Harwood Rose Queen Carnival. The decorations were exclusively "Exide."

VENNER TIME SWITCHES, LTD., of 45, Horseferry Road, Westminster, London, S.W.1, ask us to point out that they have installed additional telephone facilities. The number remains as hitherto, Victoria 2552.

The WESTERN ELECTRIC CO., LTD., Bush House, Aldwych, London, W.C.2, announces that the price of the standard equipment for talking films exhibition has been reduced. A hire-purchase scheme has also been developed.

With reference to the advertisement of the MARCONI'S WIRELESS TELEGRAPH CO., LTD., which appeared on page xxiv of our last issue the power of the transmitter of the Type A.D. 22 light-weight telephone set is 75 W. The figure five having "dropped" this read as 7 W.

A new telegraph code, compiled by E. L Bentley, is to be published in September by Messrs. E. L. BENTLEY, 4, Fenchurch Avenue, London, E.C.3. The new code will comply with the new international telegraph regulations in force from October 1st next, and pending the announcement of the title of the new issue, orders should be placed for the "New Code, by E. L. Bentley of London."

BIRMINGHAM ELECTRIC FURNACES, LTD., of Birmingham, inform us that they have received an order from Chas. Clifford and Son, Ltd., Fazeley Street Mills, Birmingham, for an electric furnace having a usable hearth 7 ft. long by 3 ft. 9 in. wide within a maximum rating of approximately 120 kW. for brass annealing. This furnace will be supplied complete with a "Birlec" 3-arm electrically-driven charging machine and loading trolleys.

With reference to the statement on page 145 of THE ELECTRICIAN for August 2nd to the effect that the Mullard Company has brought out a new six volt screened grid valve and that this is stated to be the only 6 V screened grid valve on the market in this country, the General Electric Co., Ltd., has pointed out that the Osram S.625, a double ended six volt screened grid valve, was actually on the market in August, 1927, and the Osram S.610, a single ended six volt screened grid valve, which is directly comparable with the Mullard P.M.16, was introduced on the market in this country in May of this year.

On and after August 12th, as the result of arrangements made between the EDISON SWAN ELECTRIC CO., LTD., and the BRITISH THOMSON-HOUSTON CO., LTD., the wiring supplies, lighting engineering, electric refrigeration and radio business of the B.T.-H. Co. will be taken over by the Edison Swan Electric Co., who will market the British Thomson-Houston Company's products in these lines. "Mazda" radio valves will also be marketed by the Edison Swan Electric Co., for the British Thomson-Houston Co. "Mazda" lamps will not be included under this arrangement, but will continue to be marketed by the Lamp Sales Department of the British Thomson-Houston Co., Ltd.

DESIGNS COMPETITION.

Industrial Designs of Electrical Interest in Royal Society of Arts Competition.

THE public exhibition of works sent in for this year's competition of Industrial Designs, organised by the Royal Society of Arts, opened at the Imperial Institute, South Kensington, London, on August 3rd until September 1st. Among the prizes offered was one by John Walsh Walsh, Ltd., for a design for a modern form of indirect table or pedestal illumination suitable for electric light. The designs submitted were such that, with the exception of those of one competitor, none conformed to the conditions. The judges, therefore, awarded to Mr. J. E. Tindall, of the L.C.C. Central School of Arts and Crafts, a prize of £10 10s. for his No. 3 287, and highly commended him for his Nos. 3 284, 3 285, 3 286, and 3 288. The designs of the other competitors with the exception of the Indian exhibits, were merely Victorian cut-glass lamps.

W. T. Henley's Telegraph Works Co., Ltd., offered a prize for a design to advertise the Henley wiring system, but the judges were unable to recommend that the full prize of £25 should be given. The result of the competition was that a prize of £10 was awarded to Mr. R. M. Clark, of the Liverpool City School of Art, for his No. 3 497, while Mr. W. Blamire, of 35, Eskdaill Street, Kettering, for his No. 201; Mr. R. M. Clark, for his No. 3 498; Mr. P. T. A. Roberson, City of Oxford School of Arts and Crafts, for his No. 2 307, and Mr. L. Towers, Liverpool City School of Art (No. 3 581) were commended. None of the designs submitted for competition was considered suitable for the purpose. No. 3 497 came nearest to the required standard, and this design, together with No. 3 581, No. 2 307, No. 3 498, and No. 201, showed a good standard of draughtsmanship.

NEW WIRING PLAN.

Professor's Proposed Substitute for the Three-wire System.

A PROPOSED revolutionary change in electric wiring which, it is claimed, will save consumers a considerable amount of money, was discussed at the convention of the Wisconsin Utilities Association held at Wausau, Wis., in July, when, according to the "Electrical World," Mr. Edward Bennett, professor of electrical engineering at the University of Wisconsin, announced that he has developed a substitute for the present three-wire system of distribution, substituting the steel conduit itself for one of the three wires. The first application of Prof. Bennett's discovery will be made in the wiring system of the Mechanical Engineering Building at Madison.

Prof. Bennett said that the great advantage of his proposed system is that the cost in conduit and wire will be approximately 20% less than for the three-wire system, while the reduction in labour costs is expected to amount to approximately 15%. It is claimed that electrical loss will be substantially less than for the average building as now equipped utilising one copper wire to complete the circuit, but enclosing it in the steel conduit for mechanical protection.

THE SOCIAL SIDE.

On July 20th, the Revo Electric Co., which includes the Revo Electric Main Works, the Revo Electric Heating and Cooking Department, the Revo Foundry Co., the Groveland Brass Foundry Co. and the Tividale Enamel Co., spent a very pleasant time at Bearnett House, Penn, the residence of Mr. F. H. Reeves, managing director. The Sports Committee organised the events, and Mr. Reeves entertained over 1 200 employees to tea in a marquee, tea being taken in relays of about 400 per sitting. The Revo Electric Works Prize Band was also in attendance. One of the events which caused great amusement and was a huge success, was the musical band race, the players in the band having to play their instruments and at the same time find the hidden prizes which had been placed in the pockets of two of the members of the sports committee.

A large collection of prizes had been got together, totalling 61 in all, and these were distributed in the evening by Mrs. F. H. Reeves. A delightful day was concluded with a vote of thanks being proposed by the chairman of the sports committee, Mr. Revill, and seconded by Mr. Holds, secretary to Mr. and Mrs. Reeves.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

SALFORD CORPORATION, August 10th.—Low tension, paper insulated, lead covered and armoured cables. Forms of tender from the City Electrical Engineer.

SHARDLOW BOARD OF GUARDIANS, August 10th.—Installing electricity at the Institution. Specification from Mr. J. Spencer, 4, Full Street, Derby; deposit £2 2s., returnable.

KINGSTON AND DISTRICT HOSPITAL, August 12th.—Supply of portable X-ray apparatus. Particulars from the Medical Superintendent of the Hospital.

LONDON COUNTY COUNCIL, August 12th.—Supply and installation of nine 1 000 kW rotary convertors, with static transformers. Specification, etc., from the General Manager, Tramways Offices, 23, Belvedere Road, London, S.E.1; deposit £1 1s.

UTTOXETER URBAN DISTRICT COUNCIL, August 12th.—Overhead 11 000 V transmission line; e.h.t. and l.t. cables and roadwork and public lighting; and sub-station equipment. Persons desiring to tender must notify Mr. W. C. C. Hawtayne, 9, Queen Street Place, London, E.C.4.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., August 13th.—Supply of ironclad unit type switchgear, at the National Physical Laboratory, Teddington. Specifications, etc., from the Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1; deposit £1 1s.

DUNDEE CORPORATION, August 14th.—Supply of two outdoor type transformers 400 kVA, and one 1 000 kVA indoor type transformer. Specifications from Mr. D. H. Bishop, general manager and engineer, Dudhope Crescent Road, Dundee.

CENTRAL ELECTRICITY BOARD, August 24th.—Supply, delivery, and erection of metering equipment for certain stations in the area of the South-East England Electricity Scheme, 1927. Specification No. S.E.E.—G.M.1, from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2. Deposit, £2 2s. for first copy, £1 1s. for each subsequent copy.

NEWCASTLE ENDOWED SCHOOLS, August 24th.—Electric light installation in a new wing to be erected at each of two schools, viz.: Newcastle-under-Lyme High School, and Newcastle-under-Lyme Orme Girls' School. Specifications, etc., from Messrs. Cramp and Frith, 1, Dickinson Street, Manchester; deposit £3 3s. in respect of one contract, or £6 6s. in respect of both contracts. Tenders are invited only from firms on the National Register of Electrical Installation Contractors.

COMMITTEE OF VISITORS OF GLOUCESTERSHIRE MENTAL HOSPITALS, August 26th.—Electric wiring of Wotton and Coney Hill Mental Hospitals, on "Stannos" earthed concentric system. Specification, etc., from Messrs. Handcock and Dykes, 11, Victoria Street, Westminster, S.W.1; deposit £2 2s.

MANCHESTER CORPORATION, August 30th.—Supply and delivery of one water-tube boiler superheater for Barton power station. Continuous actual evaporation of boiler 130 000 lb. of water per hour. Specification, etc., from Mr. H. C. Lamb, chief engineer and manager, Electricity Department, Town Hall, Manchester.

Refrigeration Plant.

BURY AND DISTRICT JOINT HOSPITAL BOARD, August 31st.—Supply, delivery and installation of electric refrigerator at (1) Florence Nightingale Hospital, Bury, and (2) Aitken Sanatorium, Holcombe. Specifications, etc., from Mr. F. Wild, clerk, 2, Cross Street, Bury.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—One 30 000 kW C.M.R. turbo-alternator and exciter, etc. Specifications from the Borough Electrical Engineer, 18-24, Lower Clapton Road, E.5; deposit £30.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—Fourteen 6 600 V, three-phase, metal clad, oil circuit breaker equipments, each not less than 1 000 000 V rupturing capacity; remote electrically-controlled, duplicate busbars; cabling and auxiliary gear controlling one 30 000 kW turbo-alternator, two 30 000 kVA transformers, two 15 000 kW reactance links, one 30 000 kVA busbar coupler equipment with and without reactance, and six 8 000 kW feeders. Specifications from the Borough Electrical Engineer, 18-24, Lower Clapton Road, E.5; deposit £3.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

YOGOSLAVIA.—Supply and delivery of two electric lifts for a local company. (Reference A.X. 8 315.)

CHILEAN MINISTRY OF MARINE, August 9th (extension of time).—Supply and erection of two aerial towers for new wireless station at Arica. (Reference A.X. 8 244.)

ORADEA MORE MUNICIPALITY, BUCHAREST, August 9th.—Supply and delivery, 400 single phase supply meters, 150 V, 42 cycles, 3 A; 200 single-phase supply meters, 150 V, 42 cycles, 5 A. (Reference B.X. 5 519.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, August 12th.—Supply and erection at Burrinjuck of auxiliary hydro-electric generating plant. (Reference B.X. 5 365.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 13th.—Supply of electric power plant, with undergound and overhead network, for the town of Maghagha, Minieh Province. (Reference B.X. 5 318.)

MADRAS AND SOUTHERN MAHRATTA RAILWAY CO., LTD., August 13th.—Supply of 70 a.c. motors and starters, with spares, for Perambur works remodelling. Forms of tender (£1, not returnable) from the company's office, 25, Buckingham Palace Road, London, S.W.1.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th.—Water turbine driven generating sets and switchgear for Waitaki power development (section 2). (Reference B.X. 5 278.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply and erection of steam raising plant, engine, alternator and switchgear (contract A). (Reference A.X. 7 983.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 15th.—Supply of h.t. and l.t. cable, lamps and sundries, in connection with extensions of the electricity undertaking. (Reference B.X. 5 312.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 15th.—Supply and erection of additional Diesel engine and alternator at Zagazig power station. (Reference B.X. 5 393.)

LOURENÇO MARQUES TREASURY DEPARTMENT, August 15th.—Supply and delivery of one electric motor and set of type for gilding books. (Reference B.X. 5 520.)

SOUTH AFRICAN RAILWAYS AND HARBOUR, August 15th.—Electrically-driven plate bending and flattening machine (tender No. 1498). (Reference A.X. 8 164.)

CHILEAN STATE RAILWAYS, August 16th.—Material for overhead lines, underground cable and cable boxes (Group 41); and material for lighting of locomotives and carriages (Group 43). (Reference C. 3 069*.)

CHILEAN STATE RAILWAYS, August 16th.—Telegraph and telephone materials, including copper wire and cable, switches, table telephones (Ericsson type), telephone cords, etc. (Reference C, 3 072*.)

CHILEAN STATE RAILWAYS, August 16th.—Supply of instruments of staff or tablet type, for installation at 36 stations between Alameda and Talca, locking apparatus for switches, batteries and telephone combinations. (Specification C. 3 070*.)

URUGUAY POSTS, TELEGRAPHS AND TELEPHONES, August 17th.—Supply of telegraph wire. (Reference A.X. 8 229.)

AUCKLAND ELECTRIC POWER BOARD, August 19th.—Single-phase transformers. (Reference B.X. 5 324.)

INDIA STORE DEPARTMENT, SIMLA, August 20th.—Supply and delivery of one 80 kW, 2-wire d.c. generating set for the Military Engineering Services, Razmak. (Reference B.X. 5 522.)

JOHANNESBURG CORPORATION, August 22nd.—Supply and delivery of automatic traffic signals. (Reference B.X. 5 547.)

PORT ELIZABETH MUNICIPALITY.—August 22nd. — One 10 000 kW turbo generator and condenser, boiler, steam and feed water pipes, etc. (Reference B.X. 5 430.)

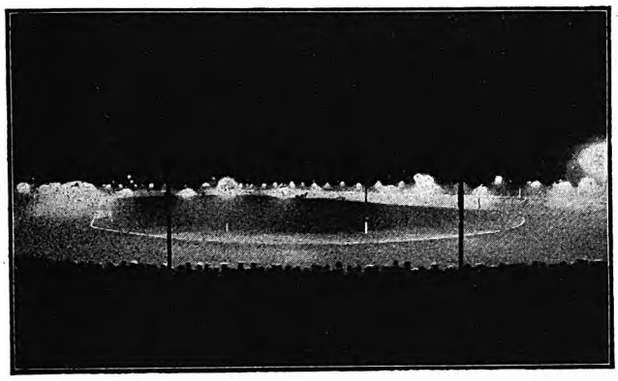
Digitized by Google

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 22nd.—Extension magneto bells, bell sets, condensers, magneto generators, central battery switchboard tumbler switches, wall and table telephones, etc. (Reference B.X. 5 415.)

GREY ELECTRIC POWER BOARD, August 27th.—Supply and erection of generating plant, for the Arnold river hydro-electric scheme. (Reference B.X. 5 422.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, August 27th.—Supply of cord type switchboards (schedule C. 448). (Reference B.X. 5 428.)

DUBLIN PORT AND DOCKS BOARD, September 3rd.—Supply and erection of two 4-ton level luffing electric portal cranes.



THE lighting of the Lea Bridge Speedway, planned by The British Thomson-Houston Co., Ltd., and installed by the Bective Electrical Co., Ltd. The installation is divided into three sections—the track, stands, and general lighting (i.e., car park, pay boxes, paddock, etc.). The supply is three-phase, 240 V, a.c., taken from the Leyton Corporation and run to a control switchboard. Each section of the lighting is equally balanced on the three phases, and, in addition, the stand lighting is operated through automatic contactors with remote control. The units for track lighting are suspended at a uniform height by means of a special catenary system, and although no less than 66 units are employed in this section of the lighting there are only 36 poles, 28 of which are on the inside of the track.

Specifications from the engineer of the board, Mr. J. Mallagh, East Wall, Dublin.

OUDTSHOORN MUNICIPALITY, SOUTH AFRICA, September 3rd.—Supply and delivery of 35 kW steam-driven generating set together with the supply and delivery only of certain switchgear material. (Reference B.X. 5 524.)

CAPE TOWN ELECTRICITY DEPARTMENT, September 4th.—Supply of overhead line material. (Reference A.X. 8 334.)

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287.) (Reference B.X. 5 308.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 7th.—Supply of v.i.r. wire. (No. P. and T. 151/1 573.) (Reference B.X. 5 416.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 10th.—Two-conductor cores (P. and T. 151/1 600.) Reference B.X. 5 462.)

LOURENÇO MARQUES PORT AND RAILWAYS, September 11th.—Battery tractors and trailers. (Reference A.X. 8 172.)

BULAWAYO MUNICIPALITY, September 13th.—Supply of h.t. overhead transmission lines, stepdown transformers, pumps with motors, etc. (Reference A.X. 8 181.)

AUCKLAND (N.Z.) ELECTRIC POWER BOARD, September 16th.—Supply of automatic sub-station at Remuera (two 500 kW machines and switchgear); automatic sub-station at Point Chevalier (two 1 000 kW machines and switchgear); 22 000 V switchgear; 6 600 V switchgear, and supervisory control apparatus. (Reference B.X. 5 506.)

MELBOURNE POSTS AND TELEGRAPHS DEPARTMENT, September 17th.—Supply and erection of petrol-electric sets. (Reference B.X. 5 537.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 23rd.—Electric light installation and distribution system for the town of Kafr-el-Cheikh (Gharbick Province). (Reference B.X. 5 502.)

INVERCARGILL (N.Z.) CORPORATION, September 23rd.—Supply and delivery of switchboard to be directly operated and suitable for controlling 11 000 V, 3-phase, 50-cycle current, it may be either of the draw-out truck type or totally armour clad, and will at first consist of seven units. (Reference B.X. 5 507.)

MELBOURNE POSTS AND TELEGRAPHS DEPARTMENT, September 24th.—Supply of condensers (schedule C. 461). (Reference B.X. 5 488.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 15th.—Seven 5 500 kVA single phase auto-transformers, with accessories, for Waitaki power scheme. (Reference B.X. 5 417.)

MELBOURNE POSTS AND TELEGRAPHS DEPARTMENT, October 15th.—Supply and delivery of switchboard instruments, test plugs and sleeves. (Reference B.X. 5 541.)

Tenders Accepted.

WAR OFFICE.—Edison Swan Electric Co., Ltd., supply of batteries.

BICESTER URBAN DISTRICT COUNCIL.—Western Electricity Co., street lighting.

LEEDS CORPORATION.—English Electric Co., Ltd., repairs to alternator, £2 750.

HULL CORPORATION.—Siemens Bros. and Co., Ltd., laying underground cables for three years.

CASTLEFORD URBAN DISTRICT COUNCIL.—F. Burrows, 3 H.P. electric motor for the baths, £13 10s.

ROTHERHAM CORPORATION.—Solus Electrical Co., installation of X-ray apparatus at Oakwood Hall, £553.

SALISBURY CORPORATION.—Salisbury Electric Light Co., electric light installation at new police station, £99.

HERTFORDSHIRE COUNTY COUNCIL.—Giffins, renewing electric light installation at Shire Hall, Hertford, £340.

DARTFORD URBAN DISTRICT COUNCIL.—Hackbridge Cable Co., Ltd., distribution cable for extensions, £202 10s.

WALSALL EDUCATION COMMITTEE.—Truman Electrical Co., electric light installation at Elmore Green School, £102.

BEDFORD RURAL DISTRICT COUNCIL.—Gollings and Ayres, electric light installation at Isolation Hospital, £81 12s.

KINGSWINFORD RURAL DISTRICT COUNCIL.—H. Victor Jones, electric light installation at Isolation Hospital, £101 10s.

AYR CORPORATION.—D. Henderson, electric light wiring of 68 houses in Seaforth Road, £18 per block of four houses.

CREWE EDUCATION COMMITTEE.—Charlesworth and Whiston, electric light installation, at Edleston Road schools.

BURY ST. EDMUNDS CORPORATION.—Electricity Committee, installation of electric heating apparatus in council chamber, £75 6s. 8d.

BROMSGROVE, DROITWICH AND REDDITCH HOSPITAL COMMITTEE.—H. Jennings and Son, electric light installation, £454 8s. 9d.

SHIPTON-UNDER-WYCHWOOD PARISH COUNCIL.—Wessex Electricity Co., Ltd., public lighting from October 1st to March next.

MAIDSTONE CORPORATION.—Johnson and Phillips, Ltd., supply and erection of overhead lines from Aylesford to West Malling, £1 361.

HALESOWEN URBAN DISTRICT COUNCIL.—W. Harrison, wiring houses on Alexander Road site, £255 5s., and houses at Long Lane, £27 10s.

HERTFORD CORPORATION.—Thomas J. Digby Illuminating Engineering Co., Ltd., improving electric lighting installation at Corn Exchange, £284 10s.

CAPE TOWN CORPORATION.—A. Reyrolle and Co., Ltd., switchgear in connection with strengthening of 11 000 V transmission system, £7 263.

GRANGE-OVER-SANDS URBAN DISTRICT COUNCIL.—Johnson and Phillips, Ltd., supply and laying of underground cables and erection of overhead lines.

EAST HAM CORPORATION.—Bertram Thomas, electrical equipment for operation of feeder circuit breakers at Church Road sub-station, £250. (Recommended.)

WAKEFIELD CORPORATION.—W. Robb, Ltd., wiring 16 houses on Thornes estate; Holden and Brooke, supply of electrically driven pumps at filtration works, £250.

COLCHESTER CORPORATION.—W. T. Henley's Telegraph Works Co., Ltd., supply and erection of overhead lines for supply to West Bergolt, £1 436 3s. 6d. (Recommended.)

BROADSTAIRS URBAN DISTRICT COUNCIL.—Isle of Thanet Electric Supply Co., Ltd., supply of electricity for North Foreland screening chamber, 3¾d. per kWh for lighting, 2¼d. for power, and 2¼d. for heating.

ESSEX COUNCIL.—Work at Black Notley sanatorium:—Electric lighting of memorial hall, H. G. Tumilty, £98; electric light fittings, General Electric Co., Ltd., £34 3s. 5d.; and F. Thomas and Co., Ltd., £25 8s. 6d.

Digitized by Google

LONDON COUNTY COUNCIL.—John Cochrane and Sons, Ltd., enlargement of tramway subway from Victoria Embankment to Southampton Row, £171 246 (lowest tender). Seven tenders received, highest £273 166.

ROTHERHAM CORPORATION.—Hogan and Wardrop, supply of cable, £6 360 10s.; A. Reyrolle and Co., Ltd., supply of two e.h.t. ring main switches, £350 13s. 6d.; British Brown Boveri, Ltd., automatic switchgear, £565.

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.—Enfield Cable Works, Ltd., 10 000 yds. 0·01 twin cable, £1 080; 750 yds. 0·15 by 0·08 by 0·15 three-core cable, £390; and 800 yds. 0·15 four-core cable, £648. (Recommended.)

ST. HELENS BOROUGH EDUCATION COMMITTEE.—Corporation Electricity Department, electric light installation at new Boys' Secondary School. The contractor whose tender was accepted on April 3rd last, was not willing to enter into the usual contract.

Overhead Wiring for Houses.

STOKE-ON-TRENT CORPORATION.—E. Holloway, overhead wiring and services for 230 houses, Vivian Road and Warrington Street, Fenton, £550; 28 houses, Marlborough Street and Evelyn Street, Fenton, £66; and 20 houses, Shelton New Road, Basford, £20.

DARTFORD CORPORATION.—The Hackbridge Cable Co., Ltd., cable for ring main scheme, £1 041 19s. 10d., and distribution cable for extensions, £202 10s.; Johnson and Phillips, Ltd., cable and joint boxes, in connection with supply to the Zinc Manufacturing Co., Ltd., £176 7s. 9d.

LONDON COUNTY COUNCIL.—Alexander Hawkins and Sons, electric wiring and fitting electric current in quarters at seven fire-stations, £639; also tendered: A. Dean and Co., £676; Rhymos, £744; Electrical Installations, Ltd., £834; Smethurst and Co. (London), Ltd., £857; Barlow Bros. and Co., £875.

CHESTERFIELD CORPORATION.—Croydon Cable Works, Ltd., 1 000 yds. e.h.t. cable, £374; Macintosh Cable Co., Ltd., 1 823 yds. l.t. cable, £1 315; English Electric Co., Ltd., switchgear, £75 10s.; Yorkshire Switchgear and Engineering Co., equipment for transformer kiosk sub-station, £257 10s.

STEPNEY (LONDON) BOROUGH COUNCIL.—Supply of meters, Reason Mfg. Co., Ltd., 5 A demand meters, £1 850, and ½ A demand meters, £1 672; Measurement, Ltd., prepayment meters, £3 087, 20 A, £480, 50 A, £275, 100 A, £36; Aron Electricity Meter, Ltd., 200-1 000 A combined demand meters, £214.

CAPE TOWN CORPORATION.—British Insulated Cables, Ltd., supply of cross arms, stay rods, spindles, etc., £1 529 4s.; British General Electric Co., supply of 1 000 channel cross arms, £214 5s.; Griffin Engineering Co., supply of fuse carriers, etc., £656; Davis and Soper, Ltd., supply of insulators, £431 3s. 10d.

HOLYWOOD URBAN DISTRICT COUNCIL.—Johnson and Phillips, Ltd., supply of (1) three-phase transformers; (2) l.t. underground and overhead mains, laying and erection; (3) l.t. switchboard, erected; (4) h.t. armour-clad switchgear, erected; (5) h.t. truck-type switchgear, erected; and (6) h.t. cable, laid and erected.

SALFORD CORPORATION.—Saunders and Taylor, Ltd., electric thermal storage system in extension of offices at Frederick Road generating station, £995; W. T. Glover and Co., Ltd., supply of 1 170 yards of single core cables, £626; Metropolitan-Vickers Electrical Co., Ltd., £536; Hackbridge Electric Construction Co., Ltd., 12 months' supply of three phase, oil immersed power transformers. (All recommended.)

CROYDON CORPORATION.—Messrs. Babcock and Wilcox, boiler house and equipment, £101 712—Metropolitan-Vickers Electrical Co., Ltd., supply of turbo-alternator, etc., £76 851; English Electric Co., Ltd., supply of switchgear, £44 227 10s.; A. Reyrolle and Co., Ltd., switchboard for control at new factory, £814; D. P. Battery Co., Ltd., new battery for tower wagon, for tramways department, £147. (All recommended.)

FERRO CARRIL CENTRAL DE BUENOS AIRES.—Westinghouse Brake and Saxby Signal Co., Ltd., electro-pneumatic signalling on new section of subway line from Federico Lacrozc to Callao, including the terminal station Federico Lacroze and six kilometres of double track, constructed partly through tube and partly through "cut and cover." The contract covers the complete apparatus, including three power frames of 23, 15 and 11 levers each, two-aspect colour light signals, electro-pneumatic train stops and point layouts, impedance bonds, track circuits, etc.

MANCHESTER CORPORATION.—Supply of incandescent lamps:—Baxendale and Co., Ltd., S. Gratrix, Jun. and Brother, Ltd., Wholesale Fittings, Ltd., John Russell and Co., Ltd., W. E. Beardsall and Co., Ltd., Hirst, Ibbetson and Taylor, Ltd., R. O'Brien and Co., Falk, Stadelmann and Co., Ltd., J. C. White and Co., Ltd., Underwood (Manchester), Ltd., F. C. Ride and Co., Berrys Electric, Ltd., "Z" Electric Lamp and Supplies, Ltd., Drake and Gorham Wholesale, Ltd., Sloan Electrical Co., Ltd., Electric Lamp Factors, Ltd., and Downes and Davies.

WEST HAM CORPORATION.—M. J. T. Thomas and Co., electric light installation at Fyfield Residential Open-air School, £421 Also tendered: G. W. Day and Co., £598; Corporation Electricity Department, £575; Weston Electric Contracts Co., £541; Warren, Smith and Co., £539; Rylands Electrical Co., £533; Woodward Bros., Ltd., £529; Burdett, and Co., Ltd., £524; Alpha Mfg. and Electrical Co., Ltd., £485; Brentwood District Electric Installation Co., Ltd., £475; Samuel Reed and Sons, £464; Central Power Engineering Co., Ltd., £455; Telephone and Electrical Maintenance Co., Ltd., £445.

METROPOLITAN ASYLUMS BOARD.—E. A. Foulds, two electric lifts at Colindale Hospital, £900. Also tendered: Titan Lift Co., Ltd., £960; Glasgow Engineers, Ltd., £1 079; J. Bennie, Ltd., £1 096; Medway's Safety Lift Co., Ltd., £1 180; W. Wadsworth and Sons, Ltd., £1 210; Express Lift Co., Ltd., £1 322; Pickerings, Ltd., £1 364; R. A. Evans, Ltd., £1 400; Waygood-Otis, Ltd., £1 430; Smith, Major and Stevens, Ltd., £1 675. Telephone and Electric Maintenance Co., fire alarm system at High Wood Hospital for Children, £290. Also tendered: Carr Bros., £248; L. G. Tate and Co., Ltd., £315; H. Lewis and Co., £344; Alpha Mfg. and Electrical Co., Ltd., £384; S. Reed and Sons, £420.

HAMMERSMITH (LONDON) BOROUGH COUNCIL.—Standard Telephones and Cables, Ltd., supply of 3 500 yards of 0·2 sq. in. cable, required in connection with supply to "Olympia" extension, £3 731 2s. 11d. (Recommended.) Also tendered:—Pirelli General Cable Works, Ltd., £3 780; Callender's Cable and Construction Co., Ltd., £3 796; Enfield Cable Works, Ltd., £3 815; W. T. Henley's Telegraph Works, Co., Ltd., £3 834; Siemens Bros. and Co., Ltd., £3 843 1s. 9d.; Macintosh Cable Co., Ltd., £3 852. A. Reyrolle and Co., Ltd., supply and erection of two and three phase switchgear in connection with supply to "Olympia" extension, £3 001 19s. (Recommended.) Also tendered:—Switchgear and Cowans, Ltd., £2 865 11s.; Park Royal Engineering Co., Ltd., £3 001 19s.; General Electric Co., Ltd., £3 001 19s.; Ferguson, Pailin, Ltd., £3 001 19s.; Metropolitan-Vickers Electrical Co., Ltd., £3 016 19s.; J. G. Statter, £1 300.

THE E.T.B.I. COMPETITION.

Nearly All Tickets Sold—Further List of Prizes and Donors.

ALTHOUGH the competition organised to raise funds for the Electrical Trades' Benevolent Institution has only been open for one month there are barely 100 tickets left for disposal. The competition, of which full details were given in our issue of June 28th, calls for general knowledge rather than for technical skill, and a number of valuable prizes are offered

The list of firms who have given prizes, published in our June 28th issue, has been considerably augmented and the following donors should be added:—

NAME OF FIRM.	PRIZE.
British Thomson-Houston Co., Ltd.	Four prizes consisting of 3-valve wireless set; 2-valve wireless set; C.2 loud speaker and cone loud speaker.
Durham Duplex Razor Co., Ltd.	Durham Duplex razors (6).
Duophone and Unbreakable Record Co., Ltd.	Three prizes of one doz. "Duophone" new electrical process records.
L. G. Hawkins and Co., Ltd. ..	"Universal" chromium plated toaster; "Noritake" table standard, flex, pushbar and holder; and 14 in. dia. silk hand-painted shade.
S. G. Leach and Co., Ltd. ..	"Dry Fan" cleaner.
Venner Time Switches, Ltd. ..	"Venner" silver grill.
Messrs. Young and Wildsmith	Wooden floor standard and shade.

Anyone who wishes to obtain tickets should apply without delay to the offices of the E.T.B.I. at 9, Southampton Street, London, W.C.1, as no further tickets will be printed when those remaining are disposed of.

WORK IN PROSPECT.

ASHTON-UNDER-LYNE.—Telephone exchange, for H.M. Office of Works, King Charles Street, London, S.W.

AYLESBURY.—Houses (22), Ledgers Road, for Finefield Estates.

BARKING.—School clinic. Particulars from Clerk.

BARNSLEY.—School (300 places), Ardsley. Particulars from the Priest in Charge.

BRADENHAM (HIGH WYCOMBE).—School, for Bucks Education Committee. Particulars from Director of Education, Aylesbury.

BURY ST. EDMUNDS.—Houses (40), for Town Council. Particulars from contractors, Messrs. Thompson and Sons, Grimsby.

CAERPHILLY.—Wesleyan church. Particulars from architects, Messrs. Phillips and Wride, Cardiff.

CARLISLE.—Houses (20), London Road, for Harrison and Hetherington. Particulars from architects, Messrs. Benwell and Slack, 28, Lowther Street.

CHESTERFIELD.—Sunday schools, Holmwood. Particulars, architects, Messrs. Jackson and Fryer, Chesterfield.

CONGRESBURY.—Houses, for Axbridge Rural District Council. Particulars from the architects, Messrs. Ball and Pope, 30, West Street, Weston-super-Mare.

CROYDON.—Church, Downs View Road. Particulars from Secretary, Moffatt Road.

CROYDON.—Church and schools. Particulars from Rev. Willis Bryars.

DARLINGTON.—Additional 50 houses. Particulars from Borough Surveyor.

DUDLEY.—School (200 places), Netherton. Particulars from clerk, Mr. G. C. V. Cant.

DULVERTON.—Housing scheme, the Rural Council. Particulars from Surveyor.

EAST HAM.—Isolation hospital extensions. Particulars from Borough Engineer.

EAST RAINTON (CO. DURHAM).—School (200 places), for Church of England managers. Particulars from Vicar.

EASTLEIGH.—School (200 places). Particulars from county architect, Mr. A. L. Roberts, The Castle, Winchester.

GLOUCESTER.—Central Hostel, Domestic College. Particulars from Clerk, Gloucester.

HIGH WYCOMBE.—Extensions, Royal Grammar School. Particulars from contractor, Mr. W. S. Try, Cowley, Uxbridge.

HUDDERSFIELD.—Additional 35 houses, Newsome, for Town Council. Particulars from Borough Architect, 26, Ramsden Street.

KETTERING.—Nurses' accommodation, for Board of Guardians. Particulars from Clerk.

KEYNSHAM.—School. Particulars from Director of Education, Weston-super-Mare.

KINGSTON-ON-THAMES.—Additional 94 houses, Norbiton, for Town Council. Particulars from Borough Surveyor.

LEITH.—Labour Exchange, for H.M. Office of Works. Particulars from the contractor, Mr. John Taylor, Yoker.

MARGATE.—Laboratory, Boys' Central School. Particulars from Borough Surveyor, 40, Grosvenor Place.

MAUCHLINE.—Remodelling and extending public school. Particulars from Director of Education, Ayr.

MOTHERWELL.—Extensions, Dalziel School. Particulars from clerk, Mr. R. C. T. Mair, 9, Clydesdale Street, Hamilton.

NEWTON-IN-MAKERFIELD.—Offices for Urban District Council. Particularsr from Mr. R. T. Surtees, Earlestow.

ORSETT.—Houses, Stifford, for Rural District Council. Particulars from surveyor, Mr. G. F. Andrassy, Palmer's Avenue, Grays.

OXFORD.—Girls' school, Headington. Particulars from architect, Mr. G. T. Gardner, 7, St. Aldates.

PRESTON.—Catholic church, Fishwick. Particulars from architects, Messrs. Mercer and Duckworth, Preston and Fleetwood.

ROCHESTER.—Outpatients' Department, St. Bartholomew's Hospital. Particulars from contractors, Messrs. W. W. Martin and Sons, Ramsgate.

SHAP (WESTMORLAND).—Church and Sunday schools. Particulars from Secretary.

TILBURY.—Housing scheme. Particulars from the Borough Surveyor.

WARRINGTON.—Re-erecting premises for the Co-operative Society. Particulars from the C.W.S. Architect, 1, Balloon Street, Manchester.

TRADE PUBLICATIONS.

THE ST. HELENS CABLE AND RUBBER CO., LTD., of Slough has published a leaflet devoted to N type adhesive rubber tape.

The ARORA Co., Loughborough, has published a new leaflet concerning the No. 124 oven, and the "Arora" immersion heater.

The BAYER SOOT BLOWER CO., LTD., 125, Balham High Road, London, S.W.12, has sent us a special folder dealing with soot-blowing equipment.

Time-discipline apparatus for factory and workshop use is dealt with in leaflet 35/F just issued by GENT AND CO., LTD., Faraday Works, Leicester.

The ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, London, W.C.2, has issued publication No. 977 dealing with distribution boards for power circuits.

The CROYDON CABLE WORKS, LTD., Mitcham Road, Croydon, Surrey, have issued a new catalogue relative to "Pernax" sheathed lead-covered cables and bird guards.

Among the latest literature issued by the JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, London, S.W.1, is a new folder dealing with the "Junior" cooker.

DRAKE AND GORHAM, LTD., Rockingham Works, Newington Causeway, London, S.E.1, has issued to the trade list No. 102, illustrating and describing e.h.t. ring controllers.

The MULLARD WIRELESS SERVICE CO., LTD., Mullard House, Charing Cross Road, London, W.C.2, has issued leaflet No. V.R. 50, illustrating valve type P.M. 254.

Publication No. H. 116, dealing with cab tyre sheathed cables and flexible, and replacing No. H.85, has been published by BRITISH INSULATED CABLES LTD., of Prescot, Lancs.

FESCOL, LTD., 101, Grosvenor Road, London, S.W.1, electro-chemical depositors and engineers, have issued a special illustrated booklet, entitled "Why It Pays to Fescolise."

"Electrical Control of Woodworking Machinery" is the title given to a new booklet by BROOKHIRST SWITCHGEAR, LTD., Northgate Works, Chester. The reference is No. 291.

The latest publications of FERRANTI, LTD., of Hollinwood, Lancs., are pamphlets T.C. 155, dealing with standard a.c. testing equipments, and T.C. 155/1, devoted to the same subject.

The WHOLESALE ELECTRIC LAMP CO., LTD., 37, Vauxhall Bridge Road, London, S.W.1, has published a new leaflet giving particulars of the revised prices of "Royalstone" fittings.

We have received from S. G. LEACH AND CO., LTD., 26/30, Artillery Lane, London, E.1, a copy of catalogue No. N.S.106, illustrating and describing repulsion-induction and split-phase motors for a.c. supply.

Leaflet No. 1512, descriptive of the "KY" relay for increasing the loads handled by lifting magnets has been published by the IGRANIC ELECTRIC CO., LTD., of 149, Queen Victoria Street, London, E.C.4.

The HART ACCUMULATOR CO., LTD., Marshgate Lane, Stratford, London, E.15, has published a folder entitled "Useful Battery Information for Electric Lighting Contractors." The reference is No. 232.

We have received from the BRITISH ELECTRIC RESISTANCE CO., Ohmic Works, Ponders End, Middlesex, a copy of list No. 400. This is a new publication describing vitreous enamelled resistance units, rheostats and resistance wires.

The DRAYTON REGULATOR AND INSTRUMENT CO., LTD., West Drayton,, Middlesex, has published leaflet P.P. 6 B, dealing with radiator and industrial steam traps, and P.P. 6 C, describing the "Drayton and Nicholson" differential steam traps.

The ELECTRICAL EQUIPMENT AND CARBON CO., LTD., Bank Buildings, 107-111, New Oxford Street, London, W.C.1, has sent us list S.C. 14, giving particulars of Silitom voltage dividers, and list B.T. 3, dealing with Elin-Bell transformers, transformer bells and buzzers.

Two new publications of FERRANTI, LTD., Hollinwood, Lancs., are list Wb 418/1 and Ga 238/1, dealing with the company's valve tester and multi-range test set, respectively. Ferranti, Ltd., has also published a new chart for the construction of a screened grid three-valve receiver.

The MULLARD WIRELESS SERVICE CO., LTD., Mullard House, Charing Cross Road, London, W.C.2, has issued leaflets V.R. 44/1a, V.R. 85/1a, V.R. 68/1a, V.R. 70/1a, V.R. 54/1a, and W.A. 20/1a, dealing with P.M. 2, P.M. 6, P.M. 4DX, P.M. 6D, P.M. 256 valves and H. type loud speakers respectively.

ELECTRICITY SUPPLY.

Liverpool and the Lister Drive Station—Overhead Lines at March—Barking and the Greatfields Estate—Electrical Development at Chesterfield—Valuation of the Watford Undertaking—The West Midlands Joint Authority.

COVENTRY City Council has applied for a loan of £4 120 for mains.

Ilkeston Corporation has decided to supply electricity at the sewage outfall works.

Lancaster R.D.C. has received sanction to borrow £12 000 for supply to Aughton.

St. Pancras (London) Electricity Committee is to extend mains at a cost of £947.

Newton Abbot U.D.C. has arranged for a supply of electricity for use in connection with its new pumping station near the River Teign.

Overhead lines are to be erected for the supply of electricity to houses on the Sandford Road estate, now being erected by the Allied Building Corporation, Chelmsford.

In connection with the forthcoming electric light scheme, Portland U.D.C. has fixed the charge for lighting at 8d. per kWh, and for all other purposes at 3d. per kWh.

Ampthill R.D.C. offers no objection to the erection of overhead lines to the Marston Valley Brick Co., at Lidlington, and in Silsoe Road, Maulden, to the Great Farm House.

Warrington electricity undertaking shows a net profit for the year of £18 464. The Electricity Committee has arranged to supply electricity to the works of the Dussek Bitumen Co., Ltd., in Lousher Lane.

The March, Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Co. is to carry out works in connection with a supply to March, and is to construct an overhead line between Whittlesey and March.

Bath Electricity Committee has recommended a reduction in the charge for electricity for lighting, from 6d. to 5½d. per kWh for the first 1 500 units per quarter, and a reduction of ½d. per kWh in the charge under the domestic rate.

Barking U.D.C. has decided to supply electric light on the Greatfields Estate. Sanction is to be sought to borrow £17 800 in respect of sub-station, switchgear, cables and public lighting on the No. 12 (Barking) section of the Becontree Estate.

In order to cope with the heavily increasing demands made by new consumers, the Electricity Commissioners have given sanction to Chesterfield Corporation to the borrowing of a further sum of £43 355 for e.h.t. and l.t. feeder cables and miscellaneous extensions to mains.

Hastings Electricity Committee has recommended the following reductions in charges:—Lighting, from 4½d. to 4d.; sliding scale of 4½d. to 3½d. reduced by 1d.; street lighting and shop window and outside decorative lighting reduced by ½d.; domestic power, from 1d. to ¾d. per kWh.

Watford Electricity Committee has met the Council's experts in regard to the valuation of the electricity undertaking with the result that the assessment had been reduced from £20 000 to £19 000. The Central Electricity Board is in negotiation with the Corporation for the acquisition of a sub-station site.

Isle of Thanet Rural Council on July 25th received an intimation of the intention of Pearson and Dorman Long, Ltd., to apply for a Special Order to supply electricity in the parishes of Stonar, Minster, and St. Lawrence Extra. The applicants pointed out that the anticipated load would be an industrial one, as there was no residential population to supply. The Council assented to the application.

Accounts of the St. Pancras B.C. electricity undertaking for the year show the gross income amounts to £293 836 14s. 9d., which is £11 043 0s. 10d. more than last year, and £42 160 15s. more than the income for 1927. The gross expenditure for the year amounts to £256 250, which is £20 804 more than last year, and £17 936 more than in 1927. The net result of the year's working is a profit of £37 586, against a profit of £47 348 last year, and a profit of £13 389 in 1927.

Liverpool City Council has rescinded its resolution of December last authorising application for the borrowing of £96 000 for the purpose of extending the Lister Drive power station No. 3, and has substituted therefor an application to borrow £46 305. The Corporation has decided to make application to the Electricity Commissioners for their sanction to the borrowing of the sum of £35 700 in respect of engineering fees in connection with the erection of the Clarence Dock station.

Hastings T.C. has agreed to pay an ex-gratia sum of £500 to Messrs. C. J. Bannister and Son, who have been supplying electricity to Northiam, as compensation in respect of their plant and goodwill of the undertaking. The plant is to remain the property of the firm, whose supply in the parish will be discontinued as from October 1st. The firm will, however, continue to supply the east end of the parish until the Council is in a position to do so, but in any case not later than October 1st, 1931.

Maidenhead T.C. has made the following reductions in charges: Lighting, by 1d. per kWh flat rate; high rate charge under maximum demand system by 2d. per kWh; fixed annual charges under the two-part tariff to business consumers, by 5% on the first £10 of the fixed charge, 10% on the next £30, and 20% on the remainder of the fixed charge; rebate of 10% on the charges for power on special contracts, prepayment two-part tariff, private consumers, a rebate of 1d. in the 1s.

The L.C.C. Special Electricity Committee reports that it has under consideration the question of the charges made for the supply of electricity to consumers through slot meters, and is in communication with the London and Home Counties Joint Electricity Authority on a suggestion that the matter could be dealt with by a general application to electricity supply undertakings of provisions in respect of meters, etc., on the lines of the relevant provisions of the Metropolitan Gas (Prepayment Meter) Act, 1900.

Chelmsford Electricity Committee has decided to ask the Electric Supply Corporation, Ltd., if it is prepared to agree not to charge more than 6d. per kWh for lighting and 1½d. for power—if the Council agrees to the cost of the change of frequency being met by a sinking fund. The Town Clerk has been instructed to communicate with the Central Electricity Board inquiring why the Board declined to bear the cost of changing the frequency in Chelmsford, and at the same time urging that Chelmsford should be included in the national scheme.

Torquay Electricity Committee has decided that a special tariff for strip lighting purposes be issued, the standing charge to be based on 25% of the wattage installed at the rate of 3s. 4½d. per quarter per 40 W lamp installed for the two summer quarters; a standing charge based on 50% of the wattage installed at the rate of 3s. 4½d. per quarter per 40 W lamp installed for the two winter quarters and a kWh charge of ¾d. in respect of all energy used for floodlighting or strip lighting purposes. The Electricity Committee has asked Mr. W. M. Selvey to report upon a scheme for the supply of the ten parishes in the Totnes rural district at a fee of 50 guineas, plus out of pocket expenses.

Statistics relating to the West Midlands Joint Electricity Authority are contained in the abstract of accounts for the year ended March 31st, 1929. The extent of the area of supply is given approximately as 1 000 square miles. Borrowing powers under the Order of 1925 are £5 000 000, total borrowing powers granted to March, 1929, amounted to £2 725 670; the public loan debt was £2 000 000, and the amount provided for redemption was £66 049. Total capacity of plant installed at the end of the year was 105 000 kW; the maximum demand was 73 320 kW; units generated totalled 213 279 120, of which 195 218 010 were sold, 16 307 140 were used on works, and 1 753 970 were lost in transmission. The percentage of units sold to units generated was 91·53.

Guildford Corporation Lighting Committee has considered schemes for the lighting by electricity those streets in the borough now lighted by gas. The cost of new standards and the supply of lamps would be £4 773. For the year ended March 31st the annual cost of lighting by gas, the lights being extinguished at midnight, with no lights in June or July, was £2 746. The estimated cost of lighting these additional streets by electricity with a similar number of lamps all the year round, the lights being extinguished at midnight, is £2 591. The Committee recommends that as from April 1st, 1930, street lighting by electricity be substituted for street lighting by gas. The Borough Electrical Engineer has reported that the cost of laying mains in streets where mains are not already laid would be £14 420, and the Electricity Committee has decided that such mains be laid.

WORKS LIGHTING.

The Bearing of Illumination on Industrial Efficiency.

WORKS efficiency is a subject which engages the attention of all works executives, and is of first importance to every department, whatever the nature of the output. Consequently correct artificial lighting, by virtue of its beneficial effect on works efficiency, is also worthy of special consideration.

Every works manager is alive to the possibilities of new plant, with a view to increasing output. Data relating to any improved form of machine is eagerly perused, but the possibilities of good lighting, from a productive point of view, are frequently overlooked. Provision of artificial lighting is frequently considered as an expense which must be borne grudgingly. Actually, however, nothing can be further from the truth. During the last few years, production engineers and physicists have carefully investigated the effect of lighting on visual operation, and have conclusively shown that, in general, increased ilumination brings about a greater output of work, and, in addition, improves the quality of that ouput. Electric light properly installed can be looked upon as an investment in industry which pays handsome dividends.

By means of lighting the eye is able to distinguish the shape and form of the object that is illuminated; for instance, the eye automatically associates certain gradations of light and shade with a round object or a vee-shaped object. Some operations require more light than others: continued work on small objects, for instance, requires a greater intensity of light for the same degree of eye comfort or efficiency than is required for larger objects, and it is therefore not surprising to find that there is a direct relationship between the amount of light available and the ability to perceive details.

Experiments show that the eye takes a perceptible time in the process of seeing an object—in fact, the eye operates in a somewhat similar fashion to a camera; it is able to work faster in high intensities of illumination than it can under low intensities. There is, therefore, a time factor in seeing an object in just the same manner as in taking a photograph.

The intensity of the light necessary will vary according to the nature of the work, but in all cases the clearness with which the object can be seen is the vital factor. The smaller the work and the greater the detail, the greater the amount of light necessary to enable that work to be carried out, and illuminating engineers, as the result of experience, are able to specify the intensities which are necessary to permit different classes of work to be easily executed with accuracy and dispatch.

Although the general illumination of horizontal surfaces is the more important, sufficient light must be available to light up vertical or oblique surfaces. A lighting system, properly designed as regards reflectors, lamps and spacing, will ensure evenness of light on the horizontal, and adequate illumination for other surfaces. Crude and obsolete lighting equipment invariably produces dense and confusing shadows, while modern lighting equipment is specially designed to diffuse light efficiently from the large vitreous enamelled reflector or opal globes.

Avoidance of Glare.

Glare of all kinds must be rigorously excluded from the modern workshop, since it is a direct cause of inefficiency in the working of the eye. In the presence of glare, the eye definitely loses a percentage of its efficiency, whether this be in its power to perceive detail or its ability to follow moving objects, to say nothing of the deleterious effect of glare in producing eye-strain or permanent damage to the delicate membranes.

It is surprising how few factories have well-surpervised or well-planned systems for cleaning lamps, reflectors, and the maintenance of the electric lighting system in general. A recent survey of the prevailing conditions in factories shows that only 20 per cent. of the equipment could be considered clean, and therefore operating at maximum efficiency. It is surely not realised to what a tremendous extent dirt and dust reduce the intensity of the illumination. Tests show that dirty equipment may account for a drop of 30 per cent. or more in the value of lighting obtained on the work bench. Every factory should have a regular and definite system of maintenance to ensure that lamps and accessories are at all times in proper adjustment and in good repair, and a maintenance chart will prove a tremendous help in ensuring that the lighting installation is maintained at a high standard of efficiency.

ELECTRIC TRACTION.

Additions to Liverpool Services—Glasgow and the Electricity Commissioners.

LIVERPOOL Corporation will shortly place on its tramway service 14 new cars.

The trackless tram service on the Hexthorpe route at Doncaster was started recently, superseding the tramway.

Halifax T.C. has received from the Ministry of Transport sanction to a loan of £8 576 for tramway reconstruction.

A Light Railway Order has been granted to Liverpool Corporation for the construction of a new line partly in Liverpool and partly in Sefton rural district.

It is understood that Prestwick Council is now likely to renew the lease of Salford tramways department for running powers over the Bury New Road tramway.

Manchester Tramways Committee has passed a resolution in favour of pressing for a by-law to enforce the slowing down of motor vehicles at tramcar stopping places.

Electrification in Canada.

The Canadian House of Commons recently voted $50 000 000 to be spent by the Canadian National Railways in a complete reconstruction of its terminal facilities at Montreal. No steam engines will be permitted to enter the new metropolitan station, the lines in the City limits being completely electrified.

At the instance of the Railways Board, Mr. C. H. Lydall, on behalf of Messrs. Merz and M'Lellan, has prepared a scheme for a tube railway in Calcutta, which is to be considered in conjunction with a project for the electrification of the suburban lines of the East Indian and Eastern Bengal Railway.

A party of 21 representatives of municipalities and important electrical concerns in Germany visited Birmingham and Wolverhampton recently to inspect the transport systems, and particularly the railless trolley system. Dr. Goossens, the leader of the party, is reported to have said that they were astounded at the great development of the trolley system.

Nearly £40 000 is to be expended on a new lighting installation for the Central London Railway, some 65 miles of cable and wire being used. Hitherto the lighting supply has been by d.c. at 600 V, but a low-voltage a.c. system is to take its place. This will provide current suitable for working certain automatic ticket-issuing machines, small illuminated signs and automatic train describers on the platforms.

A fleet of new, single-bogie type tramcars embodying several improvements are to be constructed for use on the Birkenhead tramway system. One of the chief improvements, is the elimination of noise by means of rubber blocks between the chassis and the body of the car and by the use of cork mats inside the car. A sample vehicle of this type has been fitted at the Corporation's Laird Street depot, and has given complete satisfaction.

The accounts of London County Council Highways Committee for the year ended March 31st, 1929, show a surplus on the working of tramways for the past year of £688 957, against £522 958 in the previous year. After deducting debt and other charges, there is a deficit of £6 789, against £226 211. The outstanding debt is £8 432 453. Passengers carried were 712 694 996, against 705 762 261. The saving to the road authorities in consequence of the obligation of the Council to maintain the paving along the tramway routes is estimated at £233 500 a year.

After being in service 23 years, the last of the original cars with hand operated gates on the Piccadilly (London) Tube Railway have just been withdrawn, and all the cars on this line as well as on the Central London and the Hampstead and City lines have now pneumatically operated doors. The Bakerloo Line will be similarly equipped by next December. The conversion of the tubes from old to new rolling stock will then have been accomplished in three years, and the new cars, numbering 1 343, will have cost about £2 225 000. The replacement of the District Railway rolling stock will be completed early in next year.

The Electricity Commissioners have refused to permit the proposed plant extension in Glasgow Corporation's tramway power station at Pinkeston. The proposals included an expenditure of £237 000 on reconditioning the existing plant and the installation of a spare set. Mr. P. J. D. Dollan, subconvener of the Tramways Committee, states that two-thirds of that sum would be for reconditioning the plant, which the Commissioners have no power to prevent, and the Committee will probably decide to the carrying out of this work. He says the Tramways Department has the right to supply, from Pinkston, power for the whole tramway undertaking.

COMPANY NEWS.

Little Dealing in Electrical Descriptions—Company Reports and Dividends—An American-German Electrical Move—Company Meetings.

THE electrical share market has, on the whole, been somewhat dull, the Bank Holiday accounting for a lack of interest. Supply and manufacturing descriptions are generally firm, while traction and telegraph stocks show very little movement.

DAVIS AND TIMMINS, LTD.—Intm. div. 8% ord. shs., less tax.

QUEBEC POWER CO.—Div. on common shs. of $\$\frac{1}{2}$ p. sh. has bn. declared for qrtr. endg. June 30.

RUSHDEN AND DISTRICT ELECTRIC SUPPLY CO., LTD., Intm. div. 3½% (same last year), payable Aug. 22.

BRISTOL TRAMWAYS AND CARRIAGE CO., LTD.—Int. div. 4%, less tax, on ord. shs. for half-year ended June 30.

KALGOORLIE ELECTRIC TRAMWAYS, LTD.—Receipts for 1928, £23 090, agst. £22 998; net pft. £4 721, agst. £4 300.

NORTHAMPTON ELECTRIC LIGHT AND POWER CO., LTD., Intm. div. 4% on Ord. shs. (same last year) payable Aug. 22.

YORKSHIRE ELECTRIC POWER CO.—Directors have declared intm. div. on pref. and ord. shs. of 6% for half-year ended June 30.

FALK STADELMANN AND CO., LTD.—Pft. for 1928, £97 708. Div. of 7½% proposed agst. nil, leavg. £13 261 to be carried fwd., agst. £3 927.

ELECTRIC SHOVEL CORPORATION.—Qrtrly. div. of $1 p. sh. on the 62 010 shs. of the $4 cum. participatg. pfd. stk. outstanding will be payable on Aug. 1.

TRAMWAYS AND LIGHT RAILWAYS ESTATES CO., LTD.—Receipts for 1928 were £1 210, agst. £966, and surplus was £1 011, plus £1 448 brt. in. To reduction of goodwill, £100; div. 5%; fwd. £1 606.

OLIVER PELL CONTROL, LTD.—Net pft. for year ended March 30, £8 747, as agst. £6 653, an increase of £2 094. Directors recommend 5% div. ord. shs., £1 000 to res. fund, £1 500 to special res. fund, and carrying fwd. £3 875.

ELECTRICAL DISTRIBUTION OF YORKSHIRE, LTD.—Directors have declared intm. div. on shs. issued prior to this year of 9% for half-year ended June 30 (same). Div. on shs. issued in March last will be payable in accordance with the terms of issue concurrently with the final div. for 1929.

INTERNATIONAL POWER CO., OF CANADA.—Income from divs. int., etc., for 1928, $800 471, increase, $179 327. Net surplus, after provision for deb. int. and 1st pfd. stk. div., $68 914, makg. with prior surplus, $191 841. Gross earnings of controlled cos. were $4 340 114 and net earngs. $1 945 398.

BENN BROTHERS, LTD.—Directors recommend payment of the following final divs. for the year ended June 30: 3% on pref. shs., which with the intm. div. of 3% paid in Jan., makes 6% for year; 13¾% on ord. shs., which with the intm. div. of 6¼% paid in Feb., makes 20% for year; 2s. 9d. per sh. on def. shs., which with the intm. div. of 1s. 3d. per sh. paid in Feb., makes 4s. for year.

CENTRAL STATES ELECTRIC CORPORATION.—Reg. qrtrly. divs. on 7% and 6% pfd. stks., 6% convertible optional div. pfd. and common stk. are announced. Qrtrly. div. on common stk. was 25 cents in cash, and, in additn., a div. of 2½% payable in common stk.—An issue of $10 000 000 of Central States Electric Corporation convertible pfd. stk., at $100 and accrued divs., was made in New York by Dillon and Co., on June 12.

MONTEREY RAILWAY LIGHT AND POWER CO.—Gross earnings for 1928, $132 948, agst. $1 242 336. After provisn. for operatg. exes. and for renewals, blce. was $207 062, agst. $81 717. After mtg. administratn. exes., allowing for uncollectable accts. and addg. miscellaneous income, net earngs. were $204 360, agst. $75 528. Int. $170 494, leavg. surplus (exclusive of provisn. for dfd. int. and sinkg. fund and service convenience charges of $120 600 charged to cap. acct.), $33 866, agst. debit $94 965.

POWER CORPORATION OF CANADA, INC.—The Corporation announces (div. No. 10) stk. bonus whereby holders of Six per Cent. Non-cum. Participatg. Pref. shs. will receive two shs. of no par value Common stk. for each hundred shs. held (1.50 of a sh. for each sh. held), payable Sept. 25 to holders of record at close of business on Aug. 31. Holders of no par value Common stk. of record Aug. 31, will receive on Sept. 25, 1929, certificates for Common shs. to incr. number of their shs. by 5%.

ALLGEMEINE ELEKTRIZITATS GESELLSCHAFT.—According to "The Times," the details of the transaction by which the General Electric Company of New York acquires an important interest in the A.E.G. (Allgemeine Elektrizitäts Gesellschaft), are now published. The "communiqué" says a scheme of co-operation covering all parts of the world has been agreed upon between the A.E.G. and the International General Electric Company, which represents the foreign interests of the General Electric Company of New York. An essential part of the scheme is the acquirement part of the capital of the A.E.G. by the I.G.E. The I.G.E. is to acquire nominally 30 000 000 m. of A.E.G. Ord. shares which are to be rendered available by an increase of the capital and partly by the conversion of A.E.G. Pref. shares into Ord. shares. The A.E.G. general meeting on August 27th is to be asked to approve the increase of capital from 186 250 000 to 210 000 000 marks. Five representatives of the G.E.C., including Mr. Owen Young, the president, are to enter the board of the A.E.G. It is believed that the present holding of the American concern in A.E.G. shares amounts to some 15%, and the new transaction will place the G.E.C. in control of approximately a third of the A.E.G. capital.

Company Meetings.

WEST WILTS ELECTRIC LIGHT AND POWER CO., LTD.—Gratifying progress was reported at the annual meeting held last week at Trowbridge. During the year, the company's mains have been further extended in rural areas, and there has been a satisfactory number of new consumers in all districts, resulting in increasing sales of current for lighting and power. The chairman, Mr. A. A. Douglas, in his review of the year's work paid a warm tribute to Mr. J. H. Edwards and his foresight and courage. The directors' report showed that after charging £3 500 for depreciation reserve, there was a profit of £2 899 4s. 10d., and a dividend of 6% was declared on the ordinary and preference shares of the company, £500 being carried to special reserve and £619 18s. 4d. carried forward.

WILLIAM BEARDMORE AND CO., LTD.—A separate general meeting of the holders of Preference shares was held on Tuesday, in London, having been adjourned from July 29th, owing to the absence of a quorum, for the purpose of considering resolutions approving the scheme for the reorganisation of the share and loan capital of the company.

Mr. L. C. Ord, the chairman, said: The first resolution is to sanction the scheme for the reorganisation of the share and loan capital of the company dated July 19th, 1929. A copy of the scheme has been in your hands for a considerable time, and, as was pointed out at the general meeting of the company, at which all the persons present in person were Preference shareholders, it has been necessary to make a modification in the scheme in order to satisfy the noteholders. That alteration involves the issue to them of Seven and a-half per Cent. Non-Cumulative Second Preference shares instead of Six per Cent. Non-Cumulative Second Preference shares, and the shareholders in general meeting, consisting entirely of Preference shareholders, realised the necessity of accepting the modification required by the noteholders. Mr. Neilson seconded the resolution, and, after the chairman had replied to some questions and comments by shareholders, it was carried by the requisite majority.

VICTORIA FALLS AND TRANSVAAL POWER CO., LTD.—The Marquis of Winchester, presiding at the meeting on July 25th, said the profit for 1928, after providing for taxation and all requirements, amounted to £377 295, the highest figure yet reached. This had enabled the board again to pay the maximum dividend of 10% on the preference shares, and to repeat the dividend of 15% on the ordinary shares. The sum of £50 000 was again added to the reserve fund, bringing that fund up to £550 000; £15 000 was placed to the staff fund; and £158 746 carried forward to the current year. The demand for power by the gold mining industry had not only been well maintained, but had shown a gradual and steady increase, reaching a total of over 300 000 H.P., and there were outstanding notifications which would further increase the maximum load. In course of time each of the existing mines would work out its payable ore, but this would be compensated for to a considerable extent by the opening of new mining properties, particularly in the Far Eastern Rand. With regard to the company's right at the Victoria Falls, the subject was still under negotiation with the Govern-ment of Northern Rhodesia.

NEW COMPANIES.

PEDALS, LTD.—Cap., £400. General manufacturers, electrical engineers, etc. Reg. Office: 76, Carver Street, Birmingham.

ELECTRIC SHARPENERS, LTD.—Cap., £7 500. Electricians, electrical and mechanical engineers, etc. Reg. Office: Balfour House, Finsbury Pavement, London, E.C.2.

MAGNETO DYNAMO AND CAR REPAIR WORKS, LTD.—Cap., £500. To carry on business of sale and repair of magnetos, dynamos, etc. Reg. Office: 14½, Douglas Street, Glasgow.

DENYS TURNER AND JAMES THOMAS, LTD.—Cap., £6 000. Motor, mechanical, electrical, wireless and general engineers, etc. Solicitors: MacIntosh, Thomas and Co., Cardiff.

ALWAY AND HUDSON, LTD.—Cap., £1 000. General engineers and contractors, manufacturers of and dealers in electrical machinery, etc. Reg. Office: 15, York Street, St. Pauls, Bristol.

KENNETH E. BESWICK, LTD.—Cap., £1 500. Manufacturers of components appertaining to electrical and mechanical trades. Reg. Office: Alert Works, Durban Road, Seven Kings, Essex.

SPECTAD DEVELOPMENT SYNDICATE, LTD.—Cap., £4 000. Manufacturers of and dealers in electrical and mechanical devices and signs, etc. Reg. Office: 252, West George Street, Glasgow, C.2.

CENTRAL WIRELESS CO., LTD.—Cap., £200. Manufacturers and distributors of and dealers in wireless, television and radio apparatus, etc. Secretary: C. J. Dykes, 21, Farringdon Avenue, London, E.C.

A. RANDOW, LTD.—Cap., £5 000. To acquire business of electric factor and manufacturer of silk and other lamp shades now carried on by A. E. A. Randow at 38, High Street, Colliers Wood, London, S.W.19.

SIDARBLEN ENGINES, LTD.—Cap., £500. To acquire inventions relating to engines, and to carry on business of mechanical and electrical engineers, electricians, etc. Reg. Office: 4, Old Burlington Street, London, W.1.

C. D. HALL, LTD.—Cap., £1 000. Electrical, radio and wireless engineers and manufacturers, dealers in electrical, radiographic and wireless instruments and apparatus, etc. Reg. Office: 4, St. John's Walk, Church Street, Blackpool.

VIMAX MACHINERY CO., LTD.—Cap., £100 000. To acquire trade mark "Vimax," and carry on business of mechanical and electrical engineers, etc. Reg. Office: Imrie House, 33–36, King William Street, London, E.C.4.

GISBURN MOTOR AND LIGHTING CO., LTD.—Cap., £500. To acquire business of a motor engineer, garage proprietor and producer and distributor of electricity at Gisburn, West Riding. Reg. Office: Ribblesdale Garage, Gisburn.

CHARLES CROFTON AND CO. (ENGINEERS), LTD.—Cap., £2 500. To acquire the business of general engineers and engineers' agents now carried on at 11, Marden Road South, Whitley Bay. Reg. Office: 11, Marden Road South, Whitley Bay.

EDSON ENGINEERING CO., LTD.—Cap., £100. Electrical, mechanical and general engineers, welders, electricians, producers of electricity or other motive power or source of light, etc. Reg. Office: 28A, Cathall Road, Leytonstone, London, E.11.

KENTMERE DIATOMITE CO., LTD.—Cap., £500. Producers and manufacturers of and dealers in articles which are capable of being used for heat, cold, electrical or other insulation or protection, etc. Reg. Office: 3/4, Clements Inn, Strand, London, W.C.2.

FURNEAUX AND THOMAS, LTD.—Cap., £1 000. To acquire business of electrical and mechanical engineer, electrical contractor, etc., recently carried on by A. G. Thomas at Swansea, as Furneaux and Thomas. Solicitors: Roderick and Richards, Llanelly.

TROJAN (MANCHESTER), LTD.—Cap., £8 000. To acquire businesses heretofore carried on by S. Jones and H. G. Jenkinson, trading as "The Trojan Electrical Co.," and "The Trojan Supply Co.," electrical and radio engineers, etc. Reg. Office: 13, St. Ann Street, Manchester.

SUPER ELECTRIC HEATERS (1929), LTD.—Cap., £1 000. To acquire from liquidator goodwill of business of electrical engineers and electrical apparatus manufacturers formerly carried on by Super Electric Heaters, Ltd. at Imperial Works, Lever Street, Wolverhampton.

EDIBELL SOUND FILM APPARATUS, LTD.—Cap., £200 000. Manufacturers and producers of and dealers in machinery, apparatus and appliances for recording and transmitting sound, pictures and the like, mechanical and electrical engineers, etc. Reg. Office: 40 and 41, Old Broad Street, London, E.C.2.

BURNARD'S DAIRY EQUIPMENT, LTD.—Cap., £85 000. To adopt agreement with Burnards (Established 1899) Ltd., and A. Burnard for the manufacturing of and dealing in dairy, refrigerating and ice cream plant, electrical engineers, etc. Solicitors: Ashurst, Morris, Crisp and Co., 17, Throgmorton Avenue, E.C.

THE LEAD MARKET.

The market opened with a firm tone last week, and according to James Forster and Co., by Tuesday £23 5s. had been paid for November and £23 1s. 3d. for August. Wednesday saw a sharp set back of 6s. 3d. per ton, but on Thursday the tone was again firm, particularly for the August position, which advanced 8s. 9d., while forward gained 5s., a backwardation of 1s. 3d. per ton thus being established.

Closing prices on August 2nd were £23 6s. 3d. for August and September, and £23 5s. for October and November, 13s. 9d. to 10s. per ton higher on the week.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

500 622. Class 8. Instruments and apparatus for use in wireless telephony and telegraphy, wireless telephonic apparatus in combination with gramophones, and gramophones and parts thereof. Radio-Tri-Phone, Ltd., 6, Broad Street Place, London, E.C.2; manufacturers. March 4th, 1929. Registration of this trade mark shall give no right to the exclusive use of the word "Radio-Tri-Phone."

LOCK-ATKINSON WIRELESS. (Sign.)—501 128. Class 8. Wireless instruments and apparatus. Stephen Walter Atkinson, trading as Lock-Atkinson Wireless, 311, Camden Road, London, N.7; manufacturer. March 20th, 1929. Registration of this trade mark shall give no right to the exclusive use of the letters "L.A.W."

THREE TORCHES.—501 981. Class 8. Electric batteries. Hyman Selig Myers, 6, St. Andrew's Buildings, Gallowgate, Newcastle-on-Tyne; manufacturer. April 19th, 1929.

B501 454. Class 8. Fitted electrical switchboards. The applicants undertake that this mark, when registered, and the marks Nos. 378 537, B493 896, B501 455 and B501 456 shall be assigned or transmitted only as a whole and not separately. User claimed from September 11th, 1917. B501 455. Class 13. Electrical switches for switchboards and parts thereof, being goods made principally of ordinary metal not included in other classes. The applicants undertake that this mark, when registered, and the marks Nos. 378 537, B493 896, B501 454 and B501 456 shall be assigned or transmitted only as a whole and not separately. User claimed from September 11th, 1917. B501 456. Class 18. Electrical power generating and converting plant. The applicants undertake that this mark, when registered, and the marks Nos. 378 537, B493 896, B501 454 and B501 455 shall be assigned or transmitted only as a whole and not separately. User claimed from September 11th, 1917. B493 896. Class 6. Dynamos, electric motors and parts thereof. The Electric Constructions Co., Ltd., Ingersoll House, 9, Kingsway, London, W.C.2; electrical engineers and contractors. All, April 3rd, 1929, with exception of B493 896 which is dated August 8th, 1928. The applicants undertake that this mark, when registered, and the mark No. 378 537, shall be assigned or transmitted only as a whole and not separately. User claimed from September 11th, 1917.

500 800. Class 8. Gramophones and parts thereof, gramophone pick-ups, instruments and apparatus for radio signalling, sound reproducers and thermionic amplifiers. Pohlmann and Son, Ltd., 16, Hall Street, Halifax, Yorkshire; manufacturers. March 8th, 1929.

ROCKBESTOS.—502 372. Class 8. Philosophical and scientific instruments and apparatus. The Standard Insulator Co., Ltd., Winsley House, Wells Street, Oxford Street, London, W.1; manufacturers. May 2nd, 1929. To be associated with No. 502 373 : 1 (not yet advertised).

501 485. Class 8. Philosophical and scientific instruments and apparatus. Kelvin, Bottomley and Baird, Ltd., 16 to 20, Cambridge Street, Glasgow; scientific instrument makers. April 4th, 1929. Registration of this trade mark shall give no right to the exclusive use of the dial device.

QUEENSWAY.—501 567. Class 13. Electric lamps (ordinary). Queenway, Ltd., 13 and 14, Great Queen Street, Kingsway, London, W.C.2; manufacturers. April 6th, 1929.

LION.—498 920. Class 8. Wireless telephonic receiving apparatus, but not including loud speakers sold separately. Lionel William Holt, 196, Shaftesbury Avenue, London, W.C.2.; manufacturer. January 11th, 1929. (By consent.)

G.B.C. LTD. (Sign.)—499 417. Class 8. Electric batteries, not for medical purposes. The Grosvenor Battery Co., Ltd., 2–3, White Street, Moorgate, London, E.C.2; and Grosvenor Works, Lower High Street, Watford; manufacturers. January 26th, 1929.

501 042. Class 50. Electric insulating materials included in Class 50. Isomic Works, Ltd., 47, Adam Street, New Kent Road, London, S.E.1; 481, Fort Washington Avenue, New York; 81, Avenue Philippe Auguste, Paris, France; Palisandenstrasse 83, Berlin, Germany; and 3, Via Pietro Morocco, Milan, Italy; insulating material manufacturers. March 18th, 1929. Registration of this trade mark shall give no right to the exclusive use of the word "Isomic."

PALLAS. — 502 438. Class 8. Electric accumulators and instruments. Pallas Apparate Gesellschaft mit Beschrankter Haftung, Waitzstrasse 17, Charlottenburg 4, Berlin, Germany; manufacturers. May 3rd, 1929. To be associated with No. 502 437 xviii. and another (not yet advertised).

CHARMONIC.—502 574. Class 8. Wireless instruments and apparatus. The Midland Furnishing Co., Ltd., 15 to 23, Southampton Row, London, W.C.1; merchants. May 8th, 1929.

MUNICIPAL FINANCE.

Points from the Past Year's Accounts of Electricity Undertakings.

THE total revenue for the year 1928-9 of the 53 undertakings included in the following table was £11,317,275. The gross profit on the year's working of the undertakings was £5 266 118, and the aggregate sales of electricity amounted to 2 097 742 165 kWh, while 24 undertakings out of the total number have contributed an aggregate of £287 613 to the relief of rates. In many cases the costs include items of a capital nature, and net profits have been reduced as the result of reduction of charges for current. As it is desired to make these tables as complete as possible the Editor will be pleased to receive similar particulars of other municipal electricity undertakings.

Authority.	Total Revenue. £	Gross Profit. £	Net Profit or Deficit. £	(a) Working Costs per kWh sold.	Total Cost per kWh (inc. capital charges).	Electricity sold (kWh).	Increase (+) (or) Decrease (−) in kWh sold.	Maximum Simultaneous Load in kW.	(h) Load Factor.	Radiators and Cookers Connected (total) in kW except where otherwise stated.	Other Domestic Appliances connected (total) kW.	Contributed in Aid of Rates. £

(a) Usually include management, repairs and maintenance, rates and taxes and special charges. (b) Including other domestic electrical appliances. (c) After paying income tax, £4 685. (d) On hire. (e) Approximate. (f) Not available. (g) Not yet allocated. (h) Small increase due to depressed trade conditions. (i) Rates and taxes paid by department are very high, and it is not the practice to ask for further contribution to rate relief. (k) Net deficit due to facts that whole of loans were repaid at March 31, 1929, amounting to £38 212, and that capital outlay met from revenue was £26 528. (l) After provision for special expenditure, £22 399. (m) Less £750 contributed in aid of rates. (n) Including revenue expenditure on market lighting and public lighting and all loan charges, including meters, etc. (o) After provision for interest, sinking fund and expenditure on new services, meters and cooking appliances. (p) Including special expenditure—see note (o). (q) Cookers on hire. No record of other appliances. (r) After contributing £86 103 to capital expenditure. (s) After expenditure of £1 492 on special charges of a capital nature. (t) Including £35 210 for motors, lamps, wages and materials in connection with change over from d.c. to a.c. services, costs on sale of fittings account, and income tax schedule "D." (u) Cookers only. No detailed information of other classes. (x) Approximate; 250 coppers and 113 water boilers. (y) 12 904 paid for capital works out of revenue.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BENNETT, N. S., 283, Monument Road, Birmingham, wireless factor. £42 14s. 10d. June 25th.

HERMON RADIO SUPPLIES, 2A, Wellesley Road, Wanstead, wireless and electrical engineers. £16 1s. 6d. June 5th.

HUTCHINSON, Mr. J. A., Main Street, Frodsham, radio engineer. £11 0s. 11d. June 4th.

KELLY, Mr. J., 19, Talbot Street, Rochdale, wireless dealer. £14 3s. 3d. June 27th.

MINSHALL, Mr. R., 4, Passmore Street, S.W.1, wireless engineer £20 9s. 3d. June 26th.

SAUNDERS, Cyril A. V., "Bradiston," Hare Lane, Claygate, wireless dealer. £15 13s. 2d. June 20th.

WHITE, Mr. W., "Aston Villa," Cosley Road, near Coventry, wireless dealer. £15 18s. 10d. June 4th.

STANSBURY, Leonard (trading as L. STANSBURY AND SON), 2, Empire Parade, Beckenham, wireless engineer. £54 11s. 8d. June 28th.

SYKES, Mr. W., 62, Bolton Street, Ramsbottom, wireless dealer. £12 4s. 3d. July 1st.

Bills of Sale.

SQUIRES, George Harry, 103, Ellesmere Road, Sheffield, electrical engineer. Dated July 16th, filed July 17th. £50.

WINKWORTH, David George, 20, Skinner Street, Clerkenwell, electrical engineer. Dated July 29th, filed July 31st. £35.

Receiverships.

FRANKLIN EBONITE CO., LTD.—G. R. Woollard, of 5, John Dalton Street, Manchester, was appointed receiver and manager on July 26th, 1929, under powers contained in debentures dated July 12th and 19th, 1929.

PARK ELECTRICAL AND ENGINEERING CO., LTD.—E. A. Chambers, of 40, Brazennose Street, Manchester, was appointed receiver on July 26th, 1929, under powers contained in debenture dated August 22nd, 1922. F. W. Palmer, of 74, Wellington Road, Oldham, ceased to act as receiver on July 26th, 1929.

UNITED WELDINGS AND ELECTRICAL CO., LTD.—W. H. Watson, of 36, Bulls Head Chambers, Manchester, ceased to act as receiver or manager on July 25th, 1929.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

DECORATIVE LIGHTING, LTD., 146, High Street, Kensington, and 16, Church Street, Chelsea, electrical engineers and decorative lighting experts. A meeting of creditors was held on July 31st at the offices of Beecroft, Sons and Nicholson, 12, Wood Street, E.C., when Mr. Thos. Taylor, the liquidator of the company, stated that the liabilities amounted to £1 220, and net assets £332, a deficiency of £888.

The company was incorporated on November 18th, 1927, to take over a business which had been formerly carried on by Messrs. Cunningham and Slater, who were the present directors of the company. The nominal capital was £100, in shares of 1s. each, and 40 shares had been issued for cash and were fully paid. In October 1928 the company acquired as from September 30th, 1928, the assets and liabilities of the Artistic Shade Co., a partnership concern which was being carried on by the two directors of the company at the same address as the registered offices of the present company, namely 146, High Street, Kensington.

During the first year's trading a profit was made, but subsequently losses were incurred, and, owing to the very small issued capital, the company were unable to continue the business, and, consequently, resolutions were passed for voluntary liquidation.

The creditors present passed a resolution confirming the appointment of Mr. Taylor as liquidator. An informal committee of inspection consisting of the three principal creditors was also appointed.

GOTTLIEB (J. L.) AND CO., LTD., electrical wire manufacturers, late Cromer Street, W.C. The statutory meeting of creditors in the voluntary winding-up of this company was held on August 6th at Salisbury House, London Wall, when the liquidator, Mr. F. F. Charles, stated that the meeting was purely a formal one, as all the debts of the company had been or would be paid in full, but the meeting was necessary to comply with the Companies Acts. There had been an amalgamation of Messrs. Gottlieb's business with another concern, and the whole had more recently been taken over by Aeonic Radio, Ltd. With regard to the present position, the unsecured creditors' claims, apart from a claim for income tax, amounted to £502, against which there were book debts put down at £3 478, which were estimated to be worth £1 200; cash in hand £55, and cash at bank £190. The claim for income tax amounted to £600 or thereabouts, but for the moment the claim was disputed. No questions being asked, it was decided to leave the matter in the hands of the present liquidator.

LEADBETTER, Joseph, trading as FLEETWOOD ACCUMULATOR SERVICE, The Esplanade, Fleetwood, wireless dealer. The creditors were called together on July 30th at Blackpool, when a statement of affairs was submitted which showed ranking liabilities of £1 112, and assets estimated to realise £216, or a deficiency of £896. It was reported that the debtor commenced trading at his present address in 1926 with a capital of about £20. A full set of books had not been kept, but the business was apparently successful up to January last, when a fire broke out on the premises. The debtor received £254 from the insurance company, but he estimated that he suffered a loss of at least £200. The business was also dislocated through the fire, and the charging receipts, which had averaged £6 weekly, dropped to 30s. a week. It was estimated that including the fire there was a loss during the year to May 31st last amounting to £470. The drawings had been small. An offer was made of a composition of 10s. in the £, which it was unanimously decided should be accepted.

SOUTHEND RADIO AND GRAMOPHONE CO., LTD., Queen's Road, Southend-on-Sea, and at Wickford, Essex. The statutory meeting of the creditors of the above was held in London on August 1st. It was reported that the usual resolution for voluntary liquidation had been passed, but the liquidator stated that he had not had time to go fully into the position of the company, and no detailed statement of affairs had been prepared. He estimated that the liabilities were about £500, whilst the assets comprised stock at cost £375; book debts £50; fixtures and fittings £5; and plant £50. The gramophone department of the business had been disposed of to one of the late directors of the company. That director had also taken over one of the shops at Southend, and agreed to discharge the rent outstanding. The stock at that shop had been disposed of on advantageous terms. The lease of the premises at Wickford belonged to the mother of one of the directors. The business there had been a small one, and consisted chiefly of accumulator charging. At one time the company had a branch business at Rayleigh, but it was sold to one of the directors last April. The sale price was £180. The liquidator further stated that the company was registered on October 13th, 1928, with a nominal capital of £1,000, all of which was issued for cash. He understood that the trading actually started on January 1st last, when certain businesses which had previously been carried on by Mr. F. A. Mayer were taken over. He could not say what the turnover had been, although he had been informed that since March last the sales had fallen off considerably.

After discussion, a resolution was passed in favour of an application being made to the Court for the appointment of Mr. C. Latham, of the Wireless and Radio Trades Guardian Association, 78, New Oxford Street, London, W., as liquidator.

London Gazette, etc.

Companies Winding-up Voluntarily.

GUARANTEED, LTD. By reason of its liabilities, July 25th. W. A. J. Osborne, of Balfour House, Finsbury Pavement, London, E.C.2, appointed as liquidator.

INGHAM ELECTRICAL CO., LTD. By reason of its liabilities, July 26th. W. H. Curry, Incorporated Accountant, of 8, Beech Grove, Undercliffe, Bradford, Yorks, appointed as liquidator, Meeting of creditors at the registered offices of the company, 34, Union Street, Bradford, on Friday, August 9th, 1929, at 3 p.m. Claims by August 31st.

Bankruptcy Information.

WHITTLE, Frank, 41, Mawdsley Street, Bolton, Lancs, Electrician. Receiving order, July 31st, debtor's petition.

WHITING, John Lawrence, 4, Portland Street, Newark, county of Nottingham, electrical engineer and contractor. Receiving order, July 31st. Creditor's petition. First meeting, August 14th, 11 a.m., Official Receiver's Offices, 22, Regent Street, Park Row, Nottingham. Public examination, October 3rd, 10 a.m., County Court House, St. Peter's Gate, Nottingham.

Notice of Intended Dividend.

CHARLEY, Henry Victor (trading as DINAS POWIS ELECTRICAL SUPPLY CO.), carrying on business at Station Road, Dinas Powis, county of Glamorgan, electrical engineer. Last day for receiving proofs, August 17th. Trustee, Ellis Owen, 34, Park Place, Cardiff, Official Receiver.

Order Made on Application for Discharge.

TARVER, Charles Reekes, 16, Forest Street, lately carrying on business in co-partnership with Frederick Price, at 15, Working Street, Cardiff, under the style of FRED PRICE TARVER AND CO., electrical engineers. Discharge of C. R. Tarver suspended for six months, July 2nd.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

312 617 OLDHAM AND SON, LTD. and W. D. WILDE. Electric couplings for galvanic batteries. (27/2/28.)
312 659 A. LIERENFELD. Methods of manufacturing electric lamps, discharge tubes, and the like. (27/2/28.)
312 622 ENGLISH ELECTRIC CO., LTD. and F. A. HARPER. Protective devices for electric generating and transmitting systems. (29/2/28.)
312 701 A. REYROLLE AND CO., LTD. and F. COATES. Electric couplings. (6/3/28.
312 706 SIEMENS BROS. AND CO., LTD. and D. A. CHRISTIAN. Electric signalling. (6/3/28.)
312 713 DR. A. WACKER GES. FUR ELEKTRO-CHEMISCHE INDUSTRIE GES., and DR. H. MULLER. Diaphragms and the like for electrolytic cells. (9/3/28.)
312 714 T. VARNEY and ALUMINUM CO. OF AMERICA. Method of and means for suspending and protecting aerial cables. (9/3/28.)
312 715 G. H. FLETCHER, R. BROOKS and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Electric motors. (9/3/28.)
312 720 G. R. HIGGS and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Electrically-propelled locomotives and trains. (13/3/28.)
312 724 W. M. THORNTON. Voltmeter. (15/3/28.)
312 725 J. WHITCHER, R. O. KAPP and C. G. CARRUTHERS. Protective arrangements for electric power lines or the like. (19/3/28.)
312 730 BRITISH THOMSON-HOUSTON CO., LTD., F. H. HARRIS, L. R. NIXON and J. V. PEACOCK. Systems of electric motor control. (19/3/28.)
312 734 G. WALL and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Devices employing electromagnets. (21/3/28.)
312 735 J. ALEXANDER. Automatically-operated electric switches. (22/3/28.)
312 740 E. J. JENKINS. Tanks, more particularly for oil-immersed electrical apparatus. (24/3/28.)
288 210 INTERNATIONAL GENERAL ELECTRIC CO., INC. Electric relays. (4/4/27.)
312 750 GENERAL ELECTRIC CO., LTD., G. H. WILSON and L. B. W. JOLLEY. Refractors for directional illumination. (3/4/28.)
289 054 M. MONEYRON. Electrical phase converters. (21/4/27.)
312 756 C. J. NESBITT-DUFORT and O. AND S. OILLESS BEARING CO., LTD. Electrically-operated loud-speakers. (13/4/28.)
292 579 SIEMENS AND HALSKE AKT.-GES. Arrangement for the testing of electric resistances by means of a cross-coil instrument. (24/6/27.)
312 779 A. REYROLLE AND CO., LTD. and H. BICKERTON. Circuit-breakers affording overload protection for two electric motors of different powers. (4/5/28.)
312 807 C. HILL. Telephone apparatus for self-connecting telephone-exchange offices. (29/5/28.)
312 810 W. PETO, H. M. GENESE and PRITCHETT AND GOLD AND E.P.S. CO., LTD. Electric cells or batteries. (31/5/28.)
308 748 FELTEN AND GUILLEAUME CARLSWERK AKT.-GES. Method of treating substances used for the impregnation of cables. (30/3/28.)
292 144 SOC. DES TELEPHONES GRAMMONT. Filter for preventing distortion of telephone currents. (15/6/27.)
312 821 F. W. COOK. Printing telegraph receiver. (14/6/28.)
312 822 A. PREEN. Variable-capacity electrical condensers. (14/6/28.)
303 852 CABLON, LTD. and DUSSEK BROS. AND CO., LTD. Insulating-compound for electrical conductors. (11/1/28.)
312 823 N. DENNES and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Thermally-operated electrical switches. (14/6/28.)
312 828 H. SHIMIDZU. Electric dry cell. (19/6/28.)
293 798 SOC. DES ETABLISSEMENTS AERA. Compensating-device for magnetic compasses. (12/7/27.)
293 708 AKT.-GES. BROWN, BOVERI ET CIE. Means for effecting the accurate or relative synchronism of working motors, for instance for driving paper-making machines. (8/7/27.)
312 848 H. DEAN and CHLORIDE ELECTRICAL STORAGE CO., LTD. Electric accumulators. (17/7/28.)
312 851 B. HEAP and CHLORIDE ELECTRICAL STORAGE CO., LTD. Electric accumulators. (26/7/28.)
312 853 G. H. IDE and H. L. BENTLEY. Electric switches. (27/7/28.)
312 854 G. H. IDE and H. L. BENTLEY. Electric tumbler switches. (27/7/28.)
295 031 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Control system for rectifiers and other high vacuum apparatus. (6/8/27.)
294 962 INTERNATIONAL GENERAL ELECTRIC CO., INC. Electric transformers (2/8/27.)
296 433 SIEMENS AND HALSKE AKT.-GES. Electrical apparatus for measuring the acuteness of hearing. (1/9/27.)
309 115 IDEAL WERKE AKT.-GES. FUR DRAHTLOSE TELEPHONIE. Loud-speakers (5/4/28.)
312 879 GENERAL ELECTRIC CO., LTD. and F. M. JACKSON. Ventilation of dynamo-electric machines. (7/9/28.)
312 885 E. D. FELDMAN. Electric motors. (20/9/28.)
297 465 BRITISH THOMSON-HOUSTON CO., LTD. Electromagnetic compasses of the earth inductor type. (22/9/27.)
298 531 BURGESS BATTERY CO. Battery hand lamp. (10/10/27.)
299 717 INTERNATIONAL GENERAL ELECTRIC CO., INC. Electric conductors for high voltages. (29/10/27.)
312 598 ELECTRO BLEACH AND BY-PRODUCTS, LTD., J. HOLLINS and D. JEPSON. Electro-deposition of metals. (25/2/28.)
312 599 ELECTRO BLEACH AND BY-PRODUCTS, LTD. and J. HOLLINS. Electro-deposition of metals. (25/2/28.)
312 600 ELECTRO BLEACH AND BY-PRODUCTS, LTD. J. HOLLINS and D. JEPSON. Electro-deposition of metals. (25/2/28.)
313 014 J. NEALE. Instrument for indicating and/or recording electrical pressures, currents or resistances. (1/12/27.)
312 945 F. REYNOLDS and L. SAMPLE. Electric heating, more particularly intended for use with mercury vapour lamps. (2/12/27.)
313 178 J. NEALE. Burglar and like alarms. (8/12/27.)
286 243 WAYGOOD-OTIS, LTD. Elevator safety system. (1/3/27.)
313 184 S. G. S. DICKER (NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN). Electric discharge tubes. (30/1/28.)
312 952 D. T. JONES, F. J. MOORE and IMPERIAL CHEMICAL INDUSTRIES, LTD. Manufacture of fuse heads for electrical firing. (2/2/28.)

Applications for Patents.

May 10th.

14 690 BRITISH THOMSON-HOUSTON CO., LTD. Means for regulating operation o space discharge devices. (10/5/28, U.S.)
14 659 J. W. CLOUD. Development, etc., of electrical energy.
14 694 J. M. DEAN, H. J. GARNETT and W. S. SMITH. Manufacture of insulating materials.
14 669 S. G. S. DICKER (N. V. PHILIPS' GLOEILAMPENFABRIEKEN). Current smoothing devices.
14 724 G. F. DUTTON. Microphones, etc.
14 684 FELTEN AND GUILLEAUME CARLSWERK A.G. Junctions for cables. (11/5/28, Germany.)
14 611 G. T. FUERY (VOIGT AND HAEFFNER A.G.). Electric oil brake switch.
14 626 R. GALLAHER. Electric trackless vehicles.
14 719 J. HANAUSKE. High tension cables. (11/5/28, Czecho-Slovakia.)
14 686, 14 687 MAGNET-WERK GES. EISENACH SPEZIALFABRIK FUR ELEKTROMAGNETE APPARATE. Machine for production of wood pulp for manufacture of paper. (6/2/28, Germany.)
14 613 P. L. J. MIGNET and M. P. PERRON. Electric furnaces. (7/8/28, France.)
14 580 J. MURRAY. Tramway points.
14 670 N. V. PHILIPS' GLOEILAMPENFABRIEKEN. Devices for irradiating substances with ultra-violet light. (14/6/28, Holland.)
14 709 N. V. PHILIPS' GLOEILAMPENFABRIEKEN. Thermionic valves. etc. (12/1/29, Holland.)
14 665 E. F. NORTHRUP. Induction furnaces. (5/6/28, U.S.)
14 646 M. OFFNER. Telephonic reception.
14 613 M. P. PERRON. Electric furnaces. (7/6/28, France.)
14 650 W. M. RAND. Traffic signs. (16/5/28, U.S.)
14 716 S. J. RUBINSTEIN. Batteries.
14 697 SIEMENS-SCHUCKERTWERKE A.G. Absorption refrigerators, etc. (22/5/28, Germany.)
14 698 SIEMENS-SCHUCKERTWERKE A.G. Electric switches. (23/5/28, Germany.)
14 696 SIEMENS AND HALSKE A.G. Production of diaphragm for electro-osmotic purposes. (18/5/28, Germany.)
14 672 J. R. SPINK. Electric fuses.
12 720 H. J. THOMSON. Control of electromechanical variable speed gearing.
14 700 WESTINGHOUSE ELECTRIC AND MANUFACTURING CO. Thermionic valve amplifiers. (17/5/28, U.S.)

May 11th.

14 744 E. BENNETT and W. LYONS. Battery ignition systems for motor vehicles.
14 804 H. H. BERRY. Sign frames.
14 760 F. BRAMALD. Railway signalling apparatus.
14 809 S. G. BROWN. Electromegaphones.
14 734 M. P. FAVRE-BULLE. Electric track racing mechanisms. (11/5/28, France.)
14 741 C. CRISP and W. PRIOR. Selenium cells.
14 738 W. EASTWOOD. Motor control gear.
14 817 L. EMANUELI and SOC. ITALIANA PIRELLI. High tension cables.
14 799 J. P. HALL. Electromagnetic brakes, etc.

May 13th.

14 842 ARCTURUS RADIO TUBE CO. Electrical discharge devices.
14 907 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Electric insulators. (11/5/28, U.S.)
14 903 BRITISH THOMSON-HOUSTON CO., LTD. Cut-outs. (12/5/28, U.S.)
14 904 BRITISH THOMSON-HOUSTON CO., LTD. Magnetic vane instruments. (12/5/28, U.S.)
14 905 BRITISH THOMSON-HOUSTON CO., LTD. Electric heaters. (14/5/28, U.S.)
14 877 J. E. COLLYER and COVENTRY AUTOMATIC TELEPHONES, LTD. Telephone systems.
14 829 M. A. CROSBY. Automatic electric fire alarm.
14 915 F. H. DART, GRAMOPHONE CO., LTD., and E. M. PAYNE. Electromagnetic vibratory devices for recording sound.
14 887 S. G. S. DICKER (N. V. PHILIPS' GLOEILAMPENFABRIEKEN). Electric rectifying installations.
14 888 S. G. S. DICKER (N. V. PHILIPS' GLOEILAMPENFABRIEKEN). Devices for irradiation of substances with ultra-violet rays.
14 819 ELECTRIC FIRES, LTD., and C. H. SMITH. Electrically heated hot water tanks.
14 844 GENERAL ELECTRIC CO., LTD. Luminous electric discharge tubes. (17/7/28, Germany.)
14 953 H. A. GILL (R. F. MCCARTNEY). Electrical immersion water heaters.
14 872 GRAHAM-AMPLION, LTD., and E. H. ROBINSON. Electromagnetic loud-speakers, etc.
14 899 M. HOLBROOK (NÉE NOCENZO). Electric batteries. (21/6/28, France.)
14 864 J. B. LANE and J. J. PRITTY. Overhead electric cables.
14 825 F. J. PEARCE, G. H. SCHOLES, and G. H. SCHOLES AND CO., LTD. Electrical plug and socket couplings.
14 874 B. QUENDT. Guide for cable of electric irons.
14 880 A. REYROLLE AND CO., LTD., and H. WRIGHT. Traffic signalling apparatus.
14 862 D. N. SHARMA. Transmitting and receiving kinematograph films with cathode, etc., rays.
14 896 TELEFONAKTIEBOLAGET L. M. ERICSSON. Automatic telephone systems. (14/5/28, Sweden.)
14 941 TELEFUNKEN GES. FUR DRAHTLOSE TELEGRAPHIE. Cells sensitive to infra-red rays. (11/5/28, Germany.)

May 14th.

15 020 F. H. ADAMS (1926), LTD., and C. VAUGHAN. Armature coils for electrical machines, etc.
15 021 F. H. AINSLIE and H. LEVINSON. Electric heating unit.
15 119, 15 120 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Thermal regulating devices.
14 961 H. E. BAYLISS and A. C. WOODROW AND CO. Switch control for burglar alarms.
15 113 BRITISH THOMSON-HOUSTON CO., LTD. Electric protective arrangements. (14/5/28, U.S.)
15 063 BURNDEPT WIRELESS (1928), LTD., and M. G. SCROGGIE. Variable inductances.
15 034 E. FISCHER. Telephone cables, etc.
14 980 G. S. HOLLAND. Wireless signalling.
15 097 D. P. A. A. KAYSER. Electric flashlights. (26/5/28, France.)
14 045 E. F. NORTHRUP. Inductor furnaces. (2/8/28, U.S.)
14 985 R. I. SCORER. Light diffusing device for electric lamps, etc.
15 034 SIEMENS-SCHUCKERTWERKE A.-G. Telephone, etc., cables.
15 088 SIEMENS AND HALSKE A.-G. Apparatus for telephonic delivery of audible indications in public conveyances. (11/9/28, Germany.)
15 006, 15 007 STANDARD TELEPHONES AND CABLES, LTD. (G. DEAKIN and L. POLINKOWSKY). Telephone exchange systems.
15 008 STANDARD TELEPHONES AND CABLES, LTD. (G. DEAKIN and L. POLINKOWSKY). Testing arrangements for telephone systems.
15 105 TELEFONAKTIEBOLAGET L. M. ERICSSON. Heavy current cables. (16/5/28, Sweden.)
15 022 A. R. THOMAS. Electric starters for engines.
15 030 B. VOICECHANSKIS. Safety device for wiring systems.
15 109 WESTINGHOUSE ELECTRIC AND MANUFACTURING CO. Vacuum electric tube devices. (17/5/28, U.S.)

May 15th.

15 151 E. ADAMSON and G. R. CROSKELL. Driving mechanism for electrically operated reciprocating tools.
15 218 ASSOCIATED ELECTRICAL INDUSTRIES, LTD., N. R. DAVIS, and G. A. WOOD. Electric furnaces.
15 219 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Current interruptors. (19/5/28, U.S.)
15 222 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone systems. (15/6/28, U.S.)
15 221 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., and L. M. SIMPSON. Electric totalisators.
15 191 BRITISH THOMSON-HOUSTON CO., LTD. Electric discharge devices. (19/5/28, U.S.)
15 190 BRITISH THOMSON-HOUSTON CO., LTD. (GENERAL ELECTRIC CO. OF NEW YORK). Electric condensers.
15 142 H. G. CAMPBELL. Electric furnace.
15 144 S. O. COWPER-COLES. Electrodeposition of metals.

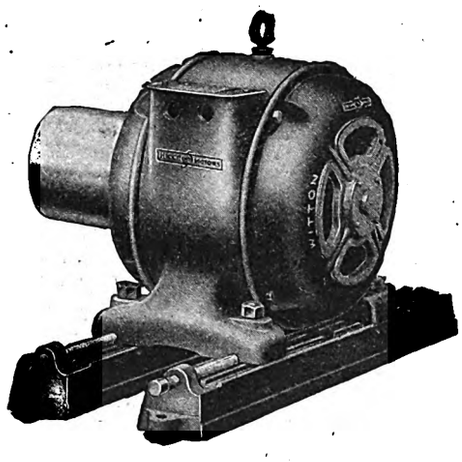
TRADE HIGGS (HM) MOTORS MARK

PROPRIETOR WALTER HIGGS, M.I.E.E.

WITTON — BIRMINGHAM

A.C. D.C.



Extensions are again in hand. Within two years HIGGS MOTORS have enlarged their works three times. In addition, the plant has run day and night for three years to supply the demand for the most popular and reliable motor, and the only one guaranteed without limit of time. Remember the origin—12 hands only—no outside capital has been introduced, all extensions are financed out of profits. This is a unique achievement and is concrete proof that we give satisfaction.

Faraday Electromagnetic Centenary.

THE arrangements initiated by the Royal Institution for the celebration of the Centenary of Faraday's discovery of electromagnetic induction have already been announced in these columns. At the representative meeting held at the house of the Institution on February 5th last, the formation of two committees was agreed to, and we learn that these committees are now at work. The first, consisting of representatives of the Royal Society, the British Association, and other scientific societies, as well as the Royal Institution, is concerned with the purely scientific aspects of Faraday's work in relation to the proposed celebrations; the second committee, which has been called together by the Institution of Electrical Engineers, consists of representatives of the principal organisations of those industries which have risen in the past hundred years upon the scientific foundation of Faraday's discoveries, and is dealing with the industrial aspects of the celebrations. The two committees are working in close co-operation; the preliminary discussions which have taken place indicate that the significance of the Centenary is very widely appreciated and that the celebrations are likely to arouse world-wide interest and support. The dates have now been fixed, and the proceedings will commence in London on Monday, September 21st, 1931. Further, an intimation has been received from the British Association that their Centenary Meeting will be held in London during the week commencing September 23rd, 1931. These two Centenaries, with important electrical conferences and other events which are to take place about the same time, will thus conjoin to make the year 1931 a memorable one in this and every country where the genius of Faraday has borne fruit.

The Wedding Present Problem.

How effectively electrical appliances for the home have solved the problem of what to give as a wedding present is shown by the pages of the London, and possibly other, suburban newspapers. In their descriptions of local weddings these papers conclude with a list of presents given to the bridal pair, and we note with interest, though without surprise, that such items as electric kettles, irons, table standards and the like are mentioned with pleasing frequency. It would appear that such gifts as cruets, smokers' companions, syphon holders and all those other accessories which were so often duplicated, have at last given way to articles which, besides expressing the esteem of the givers, are sure to be welcome, and in this turn of the tide lies an opportunity for the electrical contractor. Whereas the giving of electrical gifts for Christmas is a tremendous boost to trade, it is nevertheless confined to a few weeks. Weddings, on the other hand, do not seem to be so much governed by the seasons, and represent, therefore, opportunities for sales at all times of the year. It is true that the buying public is not so large as at Christmas, but, at the same time, the number of weddings during a year in any one locality can easily result in more electrical sales per annum than our Christmas rush; furthermore, by fostering both wedding and Christmas gifts the electrical contractor is ensuring that the "electrical present" side of his business is always alive. Suitably worded advertisements in those suburban papers which feature local affairs should soon create round the advertiser the atmosphere it is desired to make, with the result that intended guests at a local wedding will look to their local contractor for a solution of the all-important problem of what to give.

Testing Fan Performance.

A NEW British Standard Specification (No. 367–1929) has been issued with the object of defining certain features of propeller-type ceiling fans which relate to their performances, and to regulate the method of testing ceiling fans so that the results of the tests may be reasonably comparable. The type of fan covered by the specification is designed to rotate in free air, and to produce disturbance of the air in the room in which it is operating. It is obvious that to obtain a determination of the true air-movement in a room with a fan under working conditions would be extremely difficult and costly, since a large number of points would need to be examined, using instruments of high sensitivity and precision. In order to simplify the test, therefore, and make it suitable for commercial use, the specification provides a test which, whilst not strictly complying with the working conditions of the fan, is such that the effectiveness of the fan is not impaired. In preliminary tests in which the fan was suspended at the centre of a four-sided screen, it was found that the type of air-flow is characteristic and consists of a central stream of relatively high-speed air, covering an area only slightly larger than the sweep of the fan-blades, and a surrounding

Digitized by Google

stream of air which is moving relatively slowly downwards. An analysis of the test-results has shown that practically all the variation takes place in this outer, or induced, stream, and that the volume of air being removed directly by the fan-blades is practically constant. It therefore appeared that uniform results could only be obtained if the test were confined to the central air-stream. Consequently, for the purpose of this specification, the measurements are confined to this stream. The specification suggests, and we agree, that a statement of the air-delivery per watt of input is abetter indication of the service value of this type of fan than a determination of the overall mechanical efficiency, i.e., the ratio of the actual power output to the power input.

Rural Electrification.

MR. R. BORLASE MATTHEWS, the promoter of the Lincolnshire rural electrification scheme, has now lodged an application for power to supply an adjoining area in the counties of Leicestershire, Rutlandshire, Northamptonshire and the Soke of Peterborough, the granting of which would bring his total area up to 1 833 square miles, serving a population of 193 330 persons. The scheme is of interest, not only because it is the first rural scheme based upon the anticipation of the operation of the national "grid," but also because it proposes to bring electricity to the door of all but the most isolated dwellings throughout the area, instead of catering almost exclusively for urban and industrial demands. In this scheme he has an excellent opportunity to demonstrate the rightness of his contention that the rural load, properly cultivated, can be met at a price which is mutually satisfactory to the distributor and the consumer.

Our Overseas Trade.

WHEREAS June, 1929, was the first month since 1926 during which our overseas trade as a whole did not register £50 000 000 in exported goods, an increase of £16 626 347 over the June figures is shown by the returns for July. the total being £66 519 691. During the seven months of the year the total value of British exports was £425 261 977, an increase of over £9 000 000 when compared with the same period of last year, largely made up in exports of manufactured goods, coal, iron and steel manufactures. A further fall in imports of £1 937 163 compared with July, 1928, reduces the adverse trade balance to £27 031 265 for the month under review and £272 964 914 for the seven months. Bearing in mind the present labour conditions the returns may be regarded as encouraging, for, apart from the substantial increases in the exportation of manufactures of iron and steel, machinery and ships recorded for the seven months of the year, these same goods showed substantial advances during July.

The Electrical Position.

So far as the electrical position is concerned, the details of the Board of Trade returns published on another page show that shipments of machinery and apparatus and material improved during July by £592 336 when compared with the June figures. Imports of similar goods, on the other hand, increased by £103 464, making the excess of exports over imports for the month £1 114 247, compared with only £761 604 in June. With the exception of motors and generators, switchboards and batteries, every export heading showed a substantial advance, the largest shipment being in telegraph and telephone instruments, which improved by over £100 000. The increase in imports was, with the exception of machinery, switchboards, arc lamps and searchlights, due to slight advances under all headings, the largest increase being £36 272 in the case of various electrical apparatus. On the whole the returns for July, so far as the electrical industry is concerned, may be looked upon as a distinct improvement on the June figures, for with a favourable trade balance now standing at £7 008 829, and with all works busy with both home and oversea manufactures, the industry is one of the most prosperous in the country. The slight slump which set in during June is definitely checked, and it is to be hoped that the advice given in our review of the June returns will be acted upon, namely, to foster the overseas market not only when trade is bad, but also during those periods when immediate business can be conducted without the undivided attention which it ought to get. Overseas trade, whether Empire or foreign, calls for the expert experienced in overseas conditions, and so long as a certain portion of our salesmen devote their time solely to such markets, their experience will not only bring them larger sales, but will encourage that anticipation of future needs which makes for even greater expansion. The July trade shows a good recovery from the setback of June, and there is reason to believe that the gain now recorded will be consolidated and improved upon in succeeding months.

Electrical Merchandising Developments.

THE topic of the week in electricity trade circles has undoubtedly been the sequel to the recent fusion of interests between the Edison Swan Electric Co. and the British Thomson-Houston Co., as part of the great combination now gathered under one control in Associated Electrical Industries. In furtherance of the new policy of the amalgamated businesses, the Edison Swan Co. on Monday took over the wiring supplies, lighting, engineering, electric refrigeration and radio business of the B.T.H. Co. This change may be said to mark the beginning of a big development in electrical merchandising in this country, and the joint efforts of these companies under one organisation will be watched with interest.

Odorous Comparisons.

RECENT domestic discussions in the gas industry have emphasised one of the greatest of the many disadvantages of the gas cooker, and it is one that many electrical salesmen are inclined to overlook, and so may merit notice here. Briefly, the trouble is that some public-spirited member of the gas industry has discovered that the flueless gas cooker is a serious menace to health, and even life. It appears that in the early days of gas cooking the use of a flue pipe, on the oven, at any rate, was the invariable rule. But, in the modern gas cooker, there is no provision for the collection and discharge into the outer air of the products of combustion, and the gas industry relies upon the normal changing of air through doors and windows to dissipate the fumes arising from the combustion of anything up to 90 cu. ft. of gas per hour. In the more enlightened circles in the gas industry it is acknowledged that it is unfair to expose people to the risk of asphyxiation in their kitchens, and efforts to secure adequate ventilation are recommended. While this may not be a very difficult problem it seems as if any solution must by its nature act as a further setback in a field where electrical competition is daily making itself more widely felt.

"Light's Golden Jubilee."

CONVERSATIONS with Continental electrical engineers on the claims made by Americans that MR. EDISON is the sole inventor of the incandescent electric lamp suggest that objections to "Light's Golden Jubilee" in its present form are not by any means confined to this country. It is felt that a country intending to promote an international celebration might at least have consulted its proposed collaborators before finally deciding the form the activities should take. It has also been suggested that if the Americans are unwilling to make mention of the late SIR JOSEPH SWAN as the inventor of the first incandescent electric lamp they might be less reluctant to modify their arrangements if a way could be found whereby honour could be done simultaneously to all those who have notably assisted the development of the electric lamp during the past fifty years. This suggestion is certainly worth consideration; it would give the N.E.L.A. an opportunity to make a graceful withdrawal from what seems likely to become an untenable position, and would, at the same time, permit other countries to play an active part in the celebration of "Light's Golden Jubilee."

SCIENCE AND ENGINEERING.*

Our Indebtedness to Fundamental Discoveries of Science—What Further Research Work May Produce—The Training of Engineering Craftsmen.

By PROF. F. C. LEA, D.Sc.

A LITTLE more than sixty years after Watt built his first steam engine, Michael Faraday, supplementing by his unique genius the experimental work of many who preceded him, discovered that a magnet could be made to spin round a fixed wire through which a current of electricity was flowing and a wire containing a current could be made to spin round a fixed magnet. Without these and other equally fundamental experiments the wonderful developments of the generation and transmission of power which have taken place during the last fifty years, as well as the application of electricity to almost every need of the engineer, would have been impossible.

It is true that Carnot and Clausius came after Watt to perfect thermo-dynamic theory, and the modern theories of electricity were not known when Siemens made his first dynamos, but experimental and mathematical science had shown the way to engineering developments of the greatest significance to the life of the world. It has already been noticed that water-wheels were known and used to raise water 2 000 and more years ago, but in the seventeenth century water-wheels were little different from those described by Vitruvius in the first century before Christ, and had efficiencies well below 50%.

In the latter part of the eighteenth century and the beginning of the nineteenth, organised experiments on the flow of fluids had been carried out, relative velocities, momentum and kinetic energy were well understood and the next step was made by Poncelet in 1832, who enunciated the guiding principles underlying the design of vanes receiving moving fluids, and from that time progress has been so remarkable that to-day water turbines of more than 70 000 H.P. having efficiencies greater than 80% are being constructed, and millions of horse power are being generated by water-power.

The brilliant achievements in the development of the steam turbine of Sir Charles Parsons and others following in his steps are to-day well known. At the beginning of the nineteenth century there were probably 10 000 engines in England giving a total horse-power of about 200 000. To-day steam turbines, each capable of developing more than 200 000 H.P., have been or are being made for stations in various parts of the world. It seems very doubtful if this could have been possible except as a consequence of the work of Poncelet and two centuries of scientific experiment.

Achievement Through Research.

The rapid developments of high-tension distribution of power have been made possible by research in the laboratory. Many attempts had been made to utilise the explosive force of gunpowder, hydrogen, and coal gas for power production before the modern four-cycle internal combustion engine was developed, but without success, until it was recognised from thermodynamical considerations that compression is essential before ignition.

Thus it can be said that the important steps that have been made in engineering during the last hundred years and that distinguish this century from all preceding ones, were commenced and made possible by fundamental discoveries of science, and it can safely be anticipated that no new epoch-making developments in the future will be possible unless preceded by new fundamental scientific discoveries. Sufficient energy can be transmitted across oceans by directed beams to allow of telephonic communication. It seems improbable that wireless transmission will be possible for the large outputs of power-generating stations, but what the future is to reveal cannot be known. In any case the fundamental scientific work of Maxwell, Crookes, Hertz, and Fleming was essential before even a start could be made.

At present we depend upon the natural forces of air and water or the energy of controllable chemical reactions in boilers, engines, and batteries for our sources of power. Visions of engineers controlling sources of atomic energy immeasurably more powerful than those available at present sometimes come to the hopeful, inspired by the developments of experimental and mathematical physics. Rutherford has shattered the nucleus of the atom. Dr. Krapitza, in the Cavendish Laboratory at Cambridge, has claimed to have reached temperatures of 1 000 000 deg. C., and Eddington tells us that in the great power houses of the sun and the stars, where the temperatures are, it is estimated, as high as 40 000 000 deg. C., the energy of the escaping electrons of the atoms is the source which for millions of years has made and will make it possible for the sun and stars to radiate energy without appreciable fall in temperature.

It may be, and until man is more worthy at least it is hoped that it will be, impossible for atomic energy in large quantities to be obtained and controlled. Also it may be equally impossible to obtain energy by the synthetic building up of other elements from the fundamental element hydrogen, which can be obtained in abundance by the electrolysis of sea-water, but, whatever the future has to unfold, it seems certain that only by following the new ways opened by pure science can there be hope of success.

Path of the New Knowledge.

Perhaps it may be that not along this path that modern physics seems to suggest will the new knowledge come, but, as many years ago there came the new and wonderful discovery of voltaic electricity while Galvani was making experiments with frogs, so in the future a biologist or chemist or physicist, working on some problem entirely remote from the production of energy, may make discoveries which the Watts and Faradays of the future may use to change the life of the world.

From the point of view, then, of developments in engineering, modern communities cannot afford to neglect the encouragement of scientific research even in those subjects which at present may seem most remote from its activities.

In the workshops, in design, in choosing materials, very considerable difficulties have to be overcome before success is possible. The principles of the independent condenser were clearly grasped by Watt, he tells us, as he walked over Glasgow Green, but many years of labour experimenting with materials, many ingenious mechanisms were necessary before the steam engine was at all perfect, and in every step that has been taken in the direction of higher pressures and higher temperatures new materials, new processes, and new ingenious devices have been necessary before success could be achieved.

Inventive ability allied with experiments, research in the development of new metals for tools and machine elements, precise measurement, the perfection of machine shop methods, especially the very extraordinary improvements in machine tools encouraged by the new tool steels and electric driving and control, have all contributed, and wherever success has been sure the methods of science have been followed.

But though so much has been done in the development of prime movers there is perhaps no movement in engineering to-day that is of greater interest, not only to engineers but to the general community, than the attempts that are being made considerably to increase the efficiency of power production from coal and other fuels. The average overall thermodynamic efficiency of the public stations distributing electrical energy in Great Britain for the year ending March 1928 was about 15%. The best station had an efficiency of 21·3%. Recently a power unit has been supplied from England to Chicago which on test gave an efficiency of 34%—a remarkable figure.

Making allowance for boiler losses, efficiencies of from 25% to 35% ought to be possible, therefore, in the future, and if only suitable materials can be developed to meet the onerous conditions of temperature, corrosion and erosion, higher efficiencies than 35% may be anticipated with steam plant. Still higher thermodynamic efficiencies may be expected, as well as the chemical riches of the coals preserved, if, as a result of research, solid fuel engines or gas turbines can be developed.

At the temperature of from 400 deg. to 600 deg. F. at which boilers and super-heaters have until recently worked, mild steels have been found suitable. To realise higher efficiencies than at present, much higher temperatures will be required, and at contemplated temperatures of 1 000 deg. F. and upwards carbon steels creep at low stresses. Below a certain stress, at a particular temperature, which I have ventured to call "The Limiting Creep Stress," the creep ceases or becomes so small that it cannot be observed in, say, a number of days.

This "Limiting Creep Stress" is evidently the important factor in the problem of high working temperatures. Experi-

* Extracts from the Presidential Address to Section G. of the British Association, at its meeting in South Africa on August 1st.

Digitized by Google

ments indicate that with alloy steels limiting creep stresses much higher than those obtained from carbon steels may be expected and that alloys of iron, nickel, chromium, and with or without other alloyed elements, containing as much as 60% of nickel and chromium have considerable strength at high temperatures and also resist corrosion and erosion. There is still, however, a very large amount of research to be done in which the laboratory and the workshop must co-operate, as new workshop technique is required before these alloys can be used for specific purposes.

Manufacturers' Work for the Public.

Research is being undertaken by many manufacturers at great expense and the public finally reap the benefit, but it would appear that in a matter of such vital concern to industry and the community more rapid progress could be made and a much bolder policy pursued if the public organisations and the large power distributing companies and authorities accepted the responsibility of the provision of funds for research. In the Universities much fundamental work can be done if funds are available. The Department of Scientific and Industrial Research has recognised recently the importance of the subject and is assisting industry and the National Physical Laboratory to carry out researches on the physical properties of metals at high temperatures. The metal problem, associated with the hope of higher efficiencies in heat engines, is also of very great importance in connection with " low temperature " carbonisation of coal and other similar large-scale chemical engineering processes.

It may quite reasonably be said that practice in the past has led to safety. That certainly must always be the first consideration, but undue safety involving the use of too much material or even too narrow a margin of safety by using materials unsatisfactorily cannot be said to be good engineering, and engineers as well as the general public—for whom engineers are trustees—cannot be satisfied until all uncertainties that can be removed by careful scientific inquiry give place to more accurate knowledge.

Allied to the subject of structures is that of the strength of materials and their behaviour under various types of stress. For nearly seventy years experiments have been carried out to determine the effect of repeated stresses on metals, but the development of high-speed machinery during the last twenty years has focused attention upon this important subject, and it is now realised how imperfect is our knowledge. A vast amount of experimental data has been accumulated and it has been clearly shown that the safe range of stress to which a piece of material can be subjected for, let us say, an indefinite number of times, depends in some way, not yet clearly defined, upon other and more easily determined physical properties. But it is not yet always possible to foretell that some element of a locomotive or of an aeroplane engine, or structure, or other machine will not fail under the conditions it has to meet in practice.

The whole problem is bound up, not only with the physical properties which statical experiments are capable of testing, but apparently in some unknown way with the nature of the crystal structure of a metal; perhaps the stress that produces fracture depends upon the distribution of very small quantities of so-called impurities in the space lattice of the crystal, or upon the nature and properties of the material forming the crystal boundaries, and upon the surface conditions, including hardly perceptible corrosion, as well as the existence of other discontinuities incidental to the manufacture of metals. Some metals appear to fail by slipping on the crystal plane, and others by cracks commencing at crystal boundaries, or at surface discontinuities.

To the metallurgists, engineers must unstintingly pay tribute for the splendid work they have done in supplying materials to meet the ever growing and exacting needs of modern engineering. By the careful scientific control which characterises a modern steelworks, thousands of tons of apparently uniform material can be turned out, but the engineer does not always use the materials as they should be used, and the metallurgist has not always the knowledge required to insure perfect reliability under the exacting conditions of service. These, allied to the difficulties to which reference has been made, make it imperative that in this problem of the reasons for failure of metals, under repeated stresses, and their prevention, the co-operation of engineers, metallurgists, physicists, and mathematicians must be enlisted; experience alone is by no means satisfactory.

Incidental to the failure of materials in service, the recognition of synchronism as an important contributing factor, and the assistance given by experiment and dynamical theory in anticipating synchronous speeds, has been of the greatest service in the design of modern high-speed machines. Crank shafts of aeroplane engines and of internal combustion engines have been known to fail in a few minutes because designers have failed to recognise the possibilities of synchronism. Such disasters can now be avoided in many cases.

The argument of this address can be summarised into a few sentences. New epoch-making developments in engineering depend upon the discovery of new facts of science, and upon materials and technical processes. The only hope of solving many of the problems which face the engineer to-day is by carefully organised experiment. Engineering is of such vital importance to modern life that not only manufacturers but large users, public authorities and governments must be interested and provide funds for research.

In Great Britain a good deal of engineering research is being done by large firms, by research associations connected with certain industries, by the universities and by the technical colleges, the national physical and the building research laboratories, which are under the direction of the Department of Scientific and Industrial Research. This department also assists research associations by grants, and the universities by the provision of research scholarships and research assistants, but at present it seems that sufficient research is not being done, and that not nearly enough researchers are being trained to meet the needs. How can the demands of the case best be met?

It would appear that we must look largely to the universities to train researchers. I suggested that I wished to avoid the subject of the training of engineers, but one word I wish to say, and that is to refer to the necessity for the training in the universities of a considerable number of engineering students with the research outlook. Training in strict habits of observation and in the investigation of problems theoretically and by experiment should form part of the work of all engineering students. Much of the theoretical knowledge that a young engineer requires to learn is now to be found in excellent textbooks and in current periodicals, and these he should be taught to read critically and with understanding, but he should also be taught to face all his problems in the spirit of an investigator.

Certain selected students should be encouraged to remain at the universities after graduation or to return after some experience of actual works to engage specifically in research. Engineering needs such men, some to give their whole time to research while others carry the spirit of research into the ordinary problems of industry and engineering. Employers, public authorities, and governments must utilise this research ability, and more men should find their way into industry from the research institutions. The universities, however, cannot do this most important work of training researchers unless they are adequately equipped and staffed to give members of the staff the necessary time for research and to devote themselves to the training of students in research. To this end sufficient funds must be provided from private and public sources.

Training for Engineering.

One word should be said about the desirability of training engineering craftsmen to the appreciation of the scientific problems underlying their craft. When this can be done, and much more is possible than at present, it leads to an increase in efficiency and adaptability, to a greater tolerance and interest in new methods, and in the immediate task. It also leads them to appreciate the relationship of their problems to the great world of nature, and thus to a widening of that interest to which the work of the association is directed.

The engineer is faced with many unsolved problems. Nevertheless he must find immediate, if only approximate and tentative, solutions to many of them, and in the solution he often has to deal with many types of men. If experimental science and mathematics cannot give him an exact solution he must still carry on, and in this way much has been achieved. It is for this reason that the engineer has to learn much by actual experience in the workshop, in the field, and frequently he becomes impatient of science and lays too great emphasis upon experience. Manufacturers wish to see returns upon their capital and remuneration for their energy, but as an effective guarantee of future progress and in the solution of many problems in design, in processes, in materials, as well as in the discovery of new methods, it is necessary, as Francis Bacon would to-day remind us, " to apply natural philosophy to particular problems and particular problems must be carried back to natural philosophy."

UNIVERSITIES AND ELECTRICAL TECHNOLOGY.

Summer School for Teachers of Engineering at Merton College—Objects of the Course—Lectures on Electrical Subjects.

By LEWIS W. PHILLIPS, M.I.E.E.

THE halls and rooms of our ancient universities are not allowed to remain empty and lifeless during the vacation. Many summer schools are held, and one of the most popular of these is that arranged by the Board of Education at Oxford for teachers of mechanical and electrical engineering.

The first of these was held in 1921, a week of the time being spent in the laboratories of some modern university, as Birmingham, and another week at Oxford. For several years past, however, the whole of the time—about eleven days—has been spent at Oxford, usually at Oriel College, but in 1927, and again this year, the gathering was held at Merton College. This is the oldest of the colleges in Oxford, where the old and the new now blend, for the shadows of its quads at night are illuminated by floodlights and the quaint dark turnings of its staircases are made easily ascendable (till 11 p.m.) by incandescent electric lamps.

The idea of holding these courses and the working out of their practical details are largely due to Mr. A. S. Barnes, who until his retirement last year was H.M.I. of the Board of Education responsible for their organisation. His genial personality, his knowledge and love of Oxford, were great assets this year in his position as Chairman of the Course.

Mr. W. Hartas Jackson was the organising inspector responsible for this year's arrangements, and his untiring efforts and unceasing thoughtful care ensured for everyone at Oxford a wonderful time.

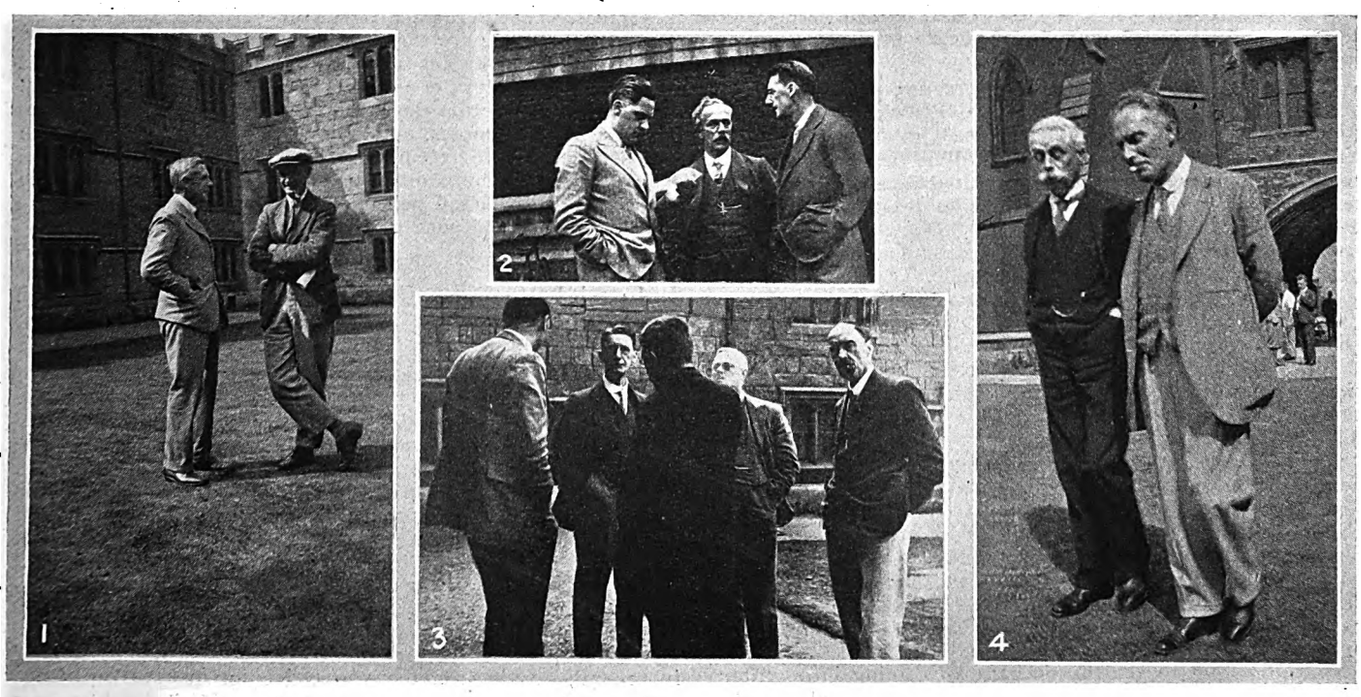
The objects of the course are primarily: (1) The increasing—and, if necessary, the rekindling—of the enthusiasm of technical teachers for their work. (2) Making contacts with other teachers for the interchange and comparison of experience, ideas and methods. (3) Providing teachers with the opportunity of hearing lectures from, and coming in personal contact with, experts in different branches of industry. (4) Humanising technical education and uniting it with the cultural aspects by discussing modern developments in a mood influenced by the atmosphere of old-world college life. (5) Bringing teachers and Board of Education Inspectors together that they might learn of each other and realise that the Board is not a dead organisation encased in red tape, but a living organism seeking to develop educational activity.

Those taking part in this year's course at Merton College had rooms in the college, meals in the old Hall, and shared as far as possible the general life of the college. The week-day activities consisted of two lectures and discussions in the morning followed by a tutorial class, the whole lasting from about 9.20 a.m. till 1 p.m. The afternoons were free for study or recreation, and after dinner there was a discussion following a lecture, closing between 10 and 10.30 p.m.

During the mornings the mechanical and electrical students had their separate lectures and tutorial classes, but in the evenings all attended the lectures held in the Technical Department of the University.

Some 45 mechanical engineering teachers and 25 electrical engineering lecturers drawn from all parts of the country attended the course. The staff for lecture and tutorial work included, on the mechanical side, Prof. Mellanby (Royal Technical College, Glasgow); Prof. B. P. Haigh (Royal Naval College, Greenwich); Prof. F. W. Burstall (Birmingham University); Prof. A. R. Horne (Heriot Watt College, Edinburgh); Prof. A. H. Gibson (Manchester University); Dr. D. S. Anderson (Principal of Birmingham Municipal Technical School); Prof. E. F. Mitchell (Imperial College of Science and Technology); Dr. A. Morley (H.M.I.); and Mr. J. A. Pearce (British Cast Iron Research Association). On the electrical engineering side were Prof. S. Parker Smith (Royal Technical College, Glasgow); Prof. J. S. Townsend (Oxford University); Dr. A. E. Clayton (Manchester University); Mr. W. John (London University); Mr. E. W. B. Gill (Merton College); Mr. H. E. Dance; Dr. J. W. T. Walsh (National Physical Laboratory); Mr. W. Wilson (General Electric Co.); Dr. A. E. Chapman (H.M.I.); Dr. C. E. Smith (H.M.I.); Mr. H. Marryat (Marryat and Scott); and Mr. H. J. Shelley (H.M.I.).

At one of the evening lectures "The Economics of the National Grid" was dealt with in a very able manner by Mr. H. Hobson, of the Central Electricity Board, and Mr. V. Z. de Ferranti presided. The lecturer indicated how the grid



THESE snapshots taken during the course at Oxford (see accompanying article) show: (1) Mr. Hartas Jackson (left) and Mr. Gill in Fellows' Quad; (2) A serious group: Mr. Shelley, Dr. Morley and Dr. Chapman; (3) A quiet talk after lecture. Facing the camera (left to right) are Dr. Chapman, Dr. Clayton and Dr. C. F. Smith. Dr. S. P. Smith is facing the centre of the group; (4) Mr. H. Marryat and Mr. A. S. Barnes enjoying a stroll in the Front Quad.

Digitized by Google

scheme had been evolved, the estimated saving to be effected and the anticipated increased demand by 1940, also the allocation of load to the different generating stations. A good discussion followed, showing the interest in, and the desire for understanding of, the scheme by the teachers.

A few years ago the Institutions of Electrical and Mechanical Engineers in conjunction with the Board of Education developed the National Certificate Scheme by means of which a student attending evening classes for five or six years and passing an Ordinary and a Higher Examination would possess the general and technical educational qualifications for admission to the Institutions as an Associate Member. The Mechanical Engineers have included Economics with their Examination (Section C) and at one of the lectures Prof. Dempster Smith spoke on "Engineering Economics with special reference to the Institution Examination." The discussion which followed made it clear that all teachers did not consider this study essential for all grades of engineers at the student stage of their careers, and that an appreciation of the rapidly changing conditions and outlook is essential.

Col. Kenelm Edgcumbe, President of the I.E.E., was at Merton for dinner in Hall one night when the toast of the Institution and its President was drunk with enthusiasm. Col. Edgcumbe later took the chair, when Prof. Thornton spoke on "The Measurement of High Voltage." This lecture, which dealt with the various methods made use of in practice, introduced some new phenomena discovered by Prof. Thornton. Two experiments never before shown in public demonstrated these. The cooling of a hot wire in air when in a strong electric field, also the cooling of a wire in a bulb of low pressure gas under similar electrical conditions revealed a very simple and effective method of high voltage measurement.

Those dealing with technical education are very keen on keeping in touch with industry and sending out into works the most effectively trained students. This was emphasised at one of the evening meetings when several leaders of industry were present. The lecturer was Sir Alfred Herbert, of Coventry. The chairman was Mr. Briggs, of the English Electric Co., and he, with Dr. Railing, of the General Electric Co., dined in Hall, spent the night in College and also attended a lecture by Prof. Townsend the following morning.

In his lecture Sir Alfred Herbert emphasised the need of allowing the boy a chance to choose for himself, and the importance of character and the development of imagination in training. A sense of humour and the quality of politeness were also essentials in dealing with the human material. The object of the technical school was to teach the underlying principles, develop breadth of mind, encourage the right kind of reading, and to give just the right amount of technical knowledge. It was necessary always to remember not only the head and the hands, but also the heart, in all our engineering training and industrial relations.

Of the morning lectures space does not permit of a full description. Mr. H. Marryat, of the Electrical Contractors' Association, spoke of the new scheme for "The Training of Young Wiremen," which it is hoped will be very helpful to that branch of industry. Prof. S. P. Smith always forces home his points in a very happy manner and he dealt with "Modern Developments in Electrical Traction," "Domestic Appliances," and gave particulars of his very successful work in Glasgow in "Courses for Automobile Engineers."

Mr. John, who is an expert in transmission, lectured on "Outdoor Sub-stations" and "Low Tension Overhead Distribution Lines." Dr. Clayton dealt with the subjects of "Power Factor Correction," "Arc Rectifiers," and "Induction Regulators." Dr. J. W. T. Walsh treated of "Illumination and its Measurement," as might be expected of him, in an illuminating but no light manner.

Mr. H. Dance, who is a consulting engineer, gave two very helpful lectures, which produced a good discussion, on "The Consumer's View of Electric Supply" and "kVA and Power Factor Measurement," demonstrating a model to show to non-technical consumers the meaning and importance of power factor. Mr. W. Wilson gave particulars of the latest developments of "Low Tension Switchgear," and Mr. Gill gave a very interesting experimental lecture on his researches in connection with the "Electric Arc."

One must not forget the pleasure of coming into contact with the charming personality of Prof. Townsend and the quiet enthusiasm he put into his lecture on his work in connection with "Conduction of Electricity in Gases."

Lectures having finished, there was a very happy concert on the evening of July 30th when technical teachers showed that they were not lacking in musical ability and appreciation, not to mention humour.

The course is over, and it is impossible to convey in words all that it meant in fellowship, joy and laughter, inspiration and knowledge to those taking part in it. But for many a day in lecture room and laboratory its effect will be manifest, and large numbers of students to whom Oxford is but a name will benefit thereby.

BOOK REVIEWS.

Electric Rectifiers and Valves. By A. GUNTHERSCHULZE. Second Edition. (Berlin: Julius Springer.) Pp. 330. 29 Marks.

Rectifiers have assumed such great importance in the last few years that books on the subject are always very welcome.

With the coming of transmissions of heavy energies by alternating current many serious problems will be encountered. For instance, surge disturbances, corona and power factor losses, etc., and, though a long way off, it may be that high voltage d.c. distribution will, at some future time, receive greater consideration.

Prof. Guntherschulze's second edition has been in many portions completely rewritten, in fact one might almost say that it has become a new book.

The first section deals with physical principles and physical properties of various classes of valves, the hot cathode, arc, and the spark valves are included. The section is dealt with very fully, and much trouble has been taken with regard to the subject of electric conduction through gases.

The second section deals with the technical aspects, wave form, and analysis of the voltage and current curves, measurements, calculations of the rectifier, special peculiarities, control, etc. This section we feel has not been as fully treated as we should have liked. The author, however, defends this curtailment in his preface by stating that the second edition of Kurt. E. Muller's book "Mercury Vapour Rectifiers," appeared whilst his own was being written. In the former the calculations, etc., of rectifiers are exhaustively treated. The rectifier is still in its infancy, and since the first edition appeared much progress has been made. The book, therefore, fulfils a real want, since in spite of constant explorations into the laws governing gas-filled valves and the dry plate rectifiers there are still wide gaps remaining in this knowledge.

The third section deals with the different types of rectifiers. After a brief mention of rotary converting plant, the various types of rectifiers are dealt with in a very interesting manner under the following headings:—(a) Electrolytic rectifiers; (b) hot cathode rectifiers; (c) vacuum rectifiers; (d) gas-filled rectifiers; (e) dry plate rectifiers; (f) arc rectifiers.

Very interesting are the details given with regard to Prof. Hartman's wave-stream rectifier. This is the first time that the theory of this type of rectifier has been so clearly expounded.

In the fourth section the author deals with the use of valves for measuring purposes, and concludes with a list of German patents relating to rectifiers, and a bibliography, a feature which could be more often given in technical books with advantage, since many points covered by various patents are hardly ever treated with the consideration they deserve.

A. MANIGHETTI.

Industrial Furnace Technique. By A. HERMANSEN. Translated from the Swedish. (London: Ernest Benn, Ltd.) Pp. xii+293. 25s. net.

The author is widely known as a designer and maker of industrial furnaces, and this attempt to rationalise furnace technique, a subject notably deficient in authoritative literature, is, to say the least, noteworthy. As electric furnaces are gradually assuming more important applications in this field it is a pity that they receive no detailed treatment in this book. In fact, the only references to electrical methods noted by the reviewer are concerned with such incidental matters as thermo-electric and electric resistance pyrometers and electric fans for producing artificial draught. Notwithstanding the slight attention devoted to electric furnaces as such, the book contains a considerable amount of material—notably in the chapters on transmission of heat, furnace-building in general, working chambers, materials for furnace building, supporting the furnace, and heat balance—which should prove useful to electrical designers. The book is commendably free from the catalogue-type descriptions which so often form the basis of works of this kind.

ILLUMINATING ENGINEERING—AS IT SHOULDN'T BE.

How Rules for Good Lighting Installations are Ignored—Plenty of Light, but Wrongly Applied—Incorrect Use of Industrial Reflectors—Lighting a Passage.

By CYRIL SYLVESTER, A.M.I.E.E., A.M.I.Mech.E.

IT is now some years since Mr. W. E. Bush, when in charge of the B.T.H. Lighting Service Bureau (later to become the E.L.M.A. Lighting Service Bureau), coined the phrase or slogan: "Seeing Is Believing." The phrase was meant to convey that, if comparisons were made between good and bad lighting systems, it would readily be seen that good lighting was a paying proposition from every point of view, and that bad lighting was not only inefficient and wasteful, but dangerous. Both the E.L.M.A. and the E.D.A. have accomplished great things since the early days, and the reformation of electric lighting has been considerably developed. I would venture to suggest, however, that neither of the bodies I have mentioned is receiving the fullest support from those they are out to assist. It is, in all probability, through this cause that progress in illumination practice on the right lines is not as rapid as it might have been.

The fact is that although very definite rules are laid down which, if followed, must result in good lighting installations, the rules are simply ignored. It is still considered by some of those responsible for the installation of electric lighting systems that a lamp is just a lamp, a reflector a reflector, and that alone, or combined, they will meet any lighting requirement. I would substantiate my remarks by quoting the slogan: "Seeing Is Believing," but in a different sense to that already mentioned. What I have seen of "Modern Lighting Practice That Isn't" is supported by the illustrations in this article. I obtained the photographs a few days ago, and in each case the installations were quite recently installed.

A Hatter's Installation.

In Fig. 3 is illustrated an example of "modern" shop window lighting. Illuminating engineers will look upon this illustration and weep. It shows a reflector, designed for top lighting, located at the bottom of a window in which is displayed men's wear, chiefly hats. This reflector is only one of several employed in this window; others are located in corners, and some of them are actually fitted in positions half-way up the window sides.

Of all types of displays, a display of hats should be illuminated from the top. There is no object in projecting light under the hats; it is the shape of the hat, as seen from the front and top, that appeals to the prospective customer. The goods should be seen in their three dimensions, as when the purchaser is wearing them. This is impossible if the tops of the goods are in semi-darkness.

If the installation were redesigned with the use of the same lighting units the window would be well illuminated. The units should be moved from the bottom and sides, and fitted behind a pelmet at the top of the window. There are sufficient lighting units in each window to permit an 18-in. spacing with 150 W gasfilled lamps. In its present form, the installation is not creditable to those who installed it. The shopkeeper, too, is not getting his money's worth. The object for which he had the units installed is defeated, merely because the light obtained from the lamps is not correctly applied. His goods are not seen to their best advantage, and, as a result, his sales cannot be as great as they might be.

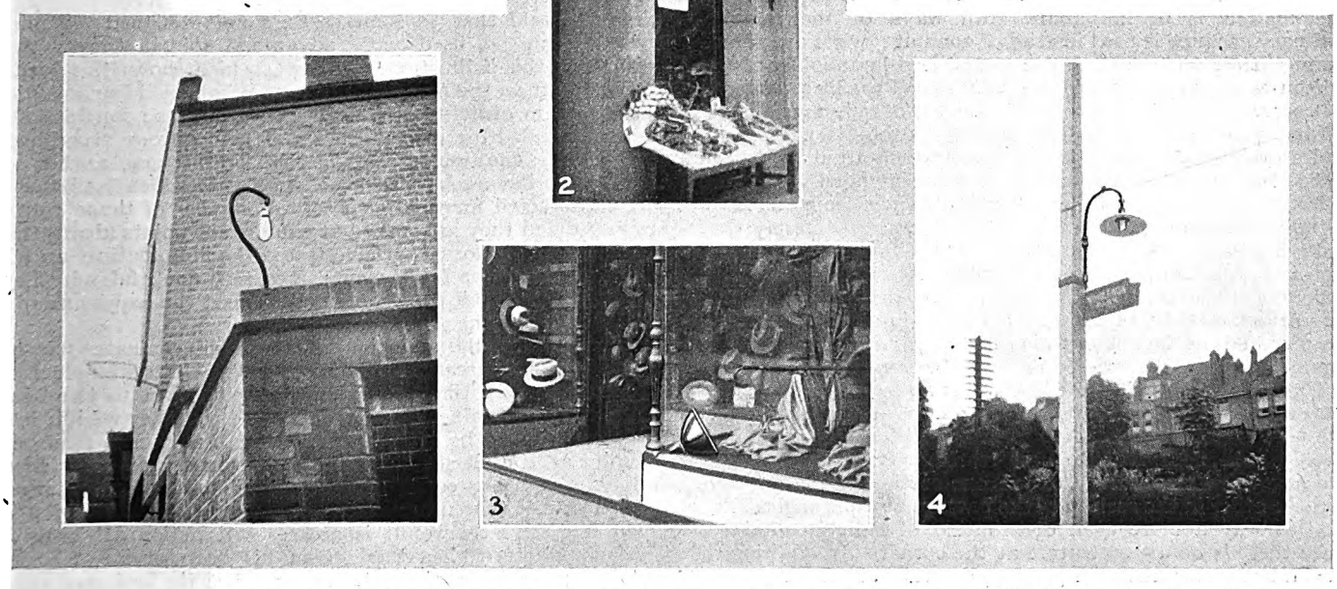
Wrong Use of Fittings.

In Fig. 2 is illustrated another example of bad lighting practice. It shows the outside of a greengrocer's shop, with the method adopted to illuminate the goods displayed on trays outside the shop. The lighting unit in this case is one which was specially designed for the illumination of industrial interiors. From a glance at the illustration it will be seen that one does not need to be an expert illumination engineer to know that not one tenth of the light from the unit is being usefully employed in illuminating the goods.

At least 50% of the light is projected into the street, to illuminate the footway and road. A large proportion of the remainder is projected through the window into the shop; a large proportion is also reflected from the window glass into the road. It may, in fact, be said that the only illumination on the goods is a small percentage of direct light.

This is not the only example of this kind of lighting that I have recently encountered. It would appear that industrial lighting units are considered as a panacea for all kinds of lighting troubles. I have seen them fitted outside drapers' establishments, inside grocery shops, and even in hotels. In the case illustrated, the correct type of unit to fit is an angle unit; one which collects the light rays which are at present being wasted. The installation of such a unit would be a practical application of the slogan: "Light on the Goods—Not on the Pavement."

Perhaps the "peach" of illuminating engineering "as it shouldn't be" is the example illustrated in Fig. 1. The installation is worth a brief description. The unit



THESE pictures of recent lighting installations, referred to above, show: (1) A curious attempt at outside lighting in a two-way passage; (2) an industrial type reflector wasting light outside a greengrocer's shop; (3) a top lighting reflector put to base uses; (4) one example of the successful use of a special-purpose fitting in a sphere for which it was not designed.

LIGHTING FOR THE MODERN INTERIOR.

THIS view of a typically modern interior emphasises to electrical manufacturers and contractors the importance of keeping closely acquainted with contemporary furnishing and interior decoration tendencies, and producing lighting fittings and fires in designs which are suitable for use in such surroundings. In décors of this kind there is ample scope for the provision of novel lighting effects which, while bearing little or no relation to traditional designs, are capable of striking a harmoniously distinctive note.

A point of interest to designers of electric fires is to be seen in the cupboard on the right of the picture, which covers a disused fireplace. The necessity of making electric heaters so that they may be fitted into existing fireplaces has seriously limited the development of the "casings" of electric heaters, but a treatment of the kind depicted promises to mitigate this disability and permit the introduction of new ideas into this field.

is mounted on the top of a wall at an angle in a passage, and its function is to illuminate both ways of the passage. Ordinary gas pipe is used instead of conduit; wires are passed through this, and terminate at a porcelain lampholder of the Edison screw type. The lamp is a 200 W gasfilled pattern; it is screwed into the holder and is devoid of reflector.

I happened to be near when this installation was completed, and, in reply to my question as to why such a unit had been fitted, I was told that the lampholder was intended for outside lighting, and that "more light" was obtained from the lamp without the use of a reflector. This shows very clearly that good lighting practice is not generally understood. It is true that the lampholder is designed for outside service, but not under these conditions. A glance at the illustration will serve to show that, in winter time, even in a slight snowfall, the terminals of the holder will quickly become short-circuited. Again, a heavy fall of rain will have the same effect.

The lampholder is intended for use in an appropriate type of reflector. More important, however, is that the location of the unit is not correct. Any unit situated at the angle of a passage will not give the best results. It is much better practice to fit two units; one in one section of the passage, and the other in the section of the passage at right angles to it. In this way a more even distribution of light is obtained, since there is no concentration at the corner. In addition, if the units are of the well-glass type, the upward rays are redirected into the passage, and watertightness is assured.

Although it is the slogan of some firms of illuminating engineers that "There is a reflector for every lighting purpose," it may be said that, in some cases, a unit designed for one purpose can be used with advantage for another. An example of this is illustrated in Fig. 4 which shows the location of a unit on the railway station at Wimbledon Park.

The system of lighting is an overhead one, the conductors being suspended by means of leather thongs from stretched steel wires. The unit is an industrial lighting one, and it is fitted, with its bracket, to a concrete pole which has been specially erected for this purpose. A number of these units are in use and they are spaced at equidistant points along the centre of the platform. I have tested the illumination and I have found it to be fairly even; it is very doubtful whether a better type of unit could be found to meet the requirements of platform lighting.

Returning to the question of the indiscriminate use of lighting units, the reason is not far to seek. Units are selected from catalogues without consideration being given to the best which can be obtained from them. The mistakes which are made can readily be overcome. Before a unit or a number of units are purchased from the sales counter of any firm supplying lighting equipment, the illuminating engineering department of that firm should be consulted. The advice is given free, and the result is greater satisfaction all round. The manufacturer has then given his best service to the installation engineer, the latter has supplied the best material to his customer, and, as a consumer, he reaps the benefit of better light output for a given energy consumption.

ELECTRIC SERVICE FOR THE FARM.

New Interest in Practical Aspects—Developments in South Wales—The Use of Mobile Electrical Exhibitions in Farming Districts.

SINCE the subject of electrical service for the farmer was so appropriately introduced by Mr. H. R. Taunton to the attention of electrical contractors at the recent E.C.A. Conference at Bournemouth, contractors and supply authorities have shown a distinctly increased interest in the practical aspects of this potentially important field of electrical development. Some of the power companies, in particular, are devoting special attention to farm electrification, and in view of the difficulties which have to be encountered in schemes of this kind the progress that has already been made in some areas is very gratifying.

Mr. E. A. Reynolds's account of developments in the rural supply area of the Shropshire, Worcestershire and Staffordshire Co. (see THE ELECTRICIAN, July 5th, 1929, page 15), are still freshly in mind, and it is unnecessary to emphasise the lessons to be learnt from the successful pioneer work done in this district.

Another supply company, the South Wales Power Co., under the enthusiastic guidance of Mr. J. W. Beauchamp, is taking energetic measures to develop rural electrical service. One of its latest activities in this sphere is illustrated in the pictures reproduced below of its mobile caravan exhibition, which made its first appearance at the Royal Welsh Agricultural Show last week.

Study of recent American reports indicates that, with a few notable exceptions, the development of electrical service on farms is little further advanced there than it is in this country.

One of the organisations making good progess in this direction is the Alabama Power Co., which, at the beginning of this year, was serving 5 511 rural customers from 836½ miles of line, an average density of 6·8 consumers per mile of line. Approximately 70% of the rural customers served at this date were farmers, and the company was serving 2 000 farmers from distribution lines that are not classed as rural.

As the result of the work that has been put into the development of the rural side, the average energy consumption by rural consumers increased from 383 kWh in 1924 to 834 kWh in 1928. The company—whose rural methods and organisation are discussed in detail in Serial Report No. 289-65 of the Rural Electric Service Committee of the National Electric Light Association, New York—states that the use of domestic electrical appliances on the 256 rural lines now in operation is quite general, and that the application of electric power in farm operations is constantly increasing. While their rural power revenue is not as yet making a satisfactory return on its investment of £400 000 in this branch of activity, they are quite hopeful that the business will be built up to self-supporting proportions within a reasonable time.

It is interesting to note, in view of recent discussions as to the advisability of monthly meter readings in our highly concentrated city and suburban supply systems, that the meters of the Alabama Co.'s rural customers are read each month, accounts being rendered at similar intervals.

Farmers in the area are coming to realise that rural electric service is resulting in more comfortable and attractive living conditions on the farm, creating new interest in farming as an occupation, reducing farm operating costs and making practicable a better balanced farming programme, and making available a convenient source of power for the operation of rural industries.

SIEMENS' NEW BUILDINGS.

We have received from Siemens-Schuckert (Great Britain), Ltd., a profusely illustrated and elaborately produced volume describing the factory and administrative buildings erected for the Siemens concerns on the Continent during the last fourteen years, to the designs and under the direction of Baudirektor Hans Hertlein. The buildings described are at Berlin, Charlottenburg, Cologne, Meitingen, Vienna, Nurnberg, Mannheim, Hanover, The Hague, etc. The book, which contains a preface by Mr. Hermann Schmitz, conveys a somewhat astonishing impression of the nature of the Siemens undertakings and the enormous extent of the premises devoted to their work.

CARAVAN EXHIBITION.

THESE pictures show a novel exhibit made by the South Wales Power Co., at the Royal Welsh Agricultural Show at Cardiff last week. It takes the form of a travelling electrical exhibit, fitted in a caravan measuring inside about 15 ft. by 7 ft. by 7 ft. 3 in. high, and running on solid rubber tyred wheels. It can be trailed by a motor or drawn by horses. During the summer it will visit agricultural shows, and in the winter it will tour the numerous villages in the company's area.

ALL four sides of the caravan open, two-thirds of each opening upwards, being hinged at the top and forming a shelter roof. The lower portion of each side opens downwards, being hinged at the floor, and can either drop right down, or can be supported horizontally, so extending the floor when desired. The power wiring is by cab tyre sheathed cable, carried under a detachable false floor, to flush type 3-pin plug sockets sunk in the floor. The lighting wiring is in the roof, arranged by means of movable battens which can be shifted to any part. One batten holds 12 shop window fittings, with three switches controlling different colours, and the centre batten holds a selection of fancy shades.

ADVERTISING FOR CONTRACTORS.

Some Fallacies Exposed—Maintaining Topical Interest—Synchronising Window Displays with Advertisements—Suitability of Illustrations.

By "PUBLICITY CONSULTANT."

(*Continued from page 78.*)

"I SUPPOSE I ought to do some advertising now and again, just to keep my name before the public." So said an electrical installation contractor who had been reading these articles. To him I said, and to all who share his desire to "keep their names before the public" I would say now, that if this is their idea of advertising they had better keep their money in their pockets. This mistaken notion is, of course, due to lack of thought, for a few moments' consideration will clearly show that members of the public are not primarily interested in the names of advertisers, but rather in the goods they offer for sale.

Fig. 1.—The introduction of human interest increases the appeal of advertisement illustrations.

Another misconception, shared by many advertisers both large and small, is that advertising costs them a certain sum of money. Naturally somebody pays for it, but the advertiser does not. Nor is it true to say that the customer pays, in the sense that the cost of the advertising is added to the normal selling price of the goods.

Actually two classes of people really pay for advertising and though the customer represents one of these classes, he pays by bringing along more money for more goods than he would have done without advertising. The advertiser's non-advertising competitors also help to pay for their rival's advertising if one takes into account the customers they lose to the advertiser.

Advertising for Direct Sales.

A further mistake commonly made is to assume that it is not much use trying to sell things outright by advertising, that one has to lead up gradually to the selling stage. With such a fallacious notion as the background of an advertising campaign it can hardly be expected that the results will be of maximum efficiency. Advertising of the right sort is responsible for the direct sale of many thousands of pounds worth of goods every day. To regard it as a mere preliminary aid to sales is to underestimate its power. It is in fact such a great selling force that many of those who use it get what seem to them to be very satisfactory results from what is undoubtedly very poor advertising. Regarded in its proper light as a printed salesman capable of taking a perfectly expressed sales message into the houses of a large proportion of your customers—actual and prospective—advertising will play a vital part in building up sales.

Retail advertisers of electrical goods, being acquainted with the E.D.A. seasonal advertising scheme, hardly need to be told that advertising should be topical, the class of goods advertised being changed in accordance with a predetermined plan which aims at selling the consumer what he needs at the time when he needs it most, and is therefore in the most receptive mood for our printed sales arguments.

But within the general advertising scheme provision should be made for participation in events of a still more topical nature. Some local happening of current news interest will often suggest a special electrical announcement, and sudden and notable changes in the weather are always good game for the electrical retail advertiser—for no matter whether it be hot or cold, he always has available the appropriate temperature-adjusting device.

Events of national as well as local importance are sometimes worth exploiting in advertisements, and the contractor who chooses the right time to announce that the radio valves used on the latest aeroplane to cross the Atlantic are similar in every way to those now available to local listeners will need to see that his stocks are adequate. If he can also convey, without undue exaggeration, the impression that the article which has played a part in some such outstanding achievement is only just good enough for Mr. or Mrs. Smith, so much the better.

What does the Public Want?

It has often been said that the secret of successful retail trading is to "give the public what it wants." But this is only a half-truth, for half the time the public does not really know what it does want, and it is up to the advertiser, by use of a species of auto-suggestion, to make the public realise what it does want. It is, indeed, fortunate for the advertiser that this is so, for if people only bought things of which they spontaneously felt the need, trade in this country would be of much smaller dimensions than it is. Within reason then, the public will want whatever you want it to want, provided you make the suggestion in the right way.

By hitching up his announcements to events of topical interest the advertiser tempts people to read them, and he also gives them the sub-conscious impression that he is "alive," and is capable of supplying everything that is up to date.

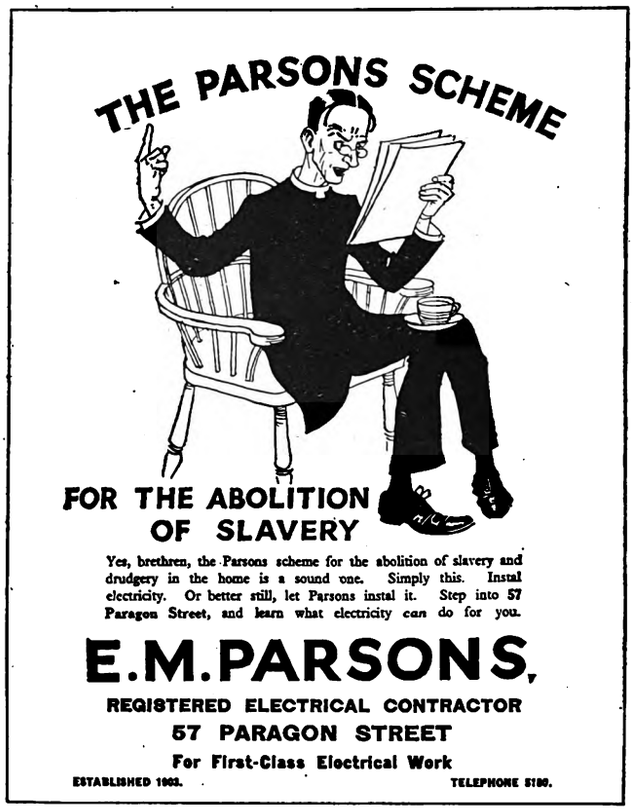

Fig. 2.—A recent example of the effective use of humour in advertising. The original announcement from which this is reproduced measured 7¼ in. by 9½ in.

More than many types of trader, the electrical retailer has ample and frequent opportunities to associate himself not only with local news events but with happenings of world-wide interest; events that form the newspaper topics of the day. Somebody flew a prodigious distance and was saved from disaster by his wireless set equipped with Blank's valves.

Digitized by Google

It requires little imagination to see how this event can be made to swell the sales of Blank's valves.

To take another example: a well-known railway running a fast luxury train to and from Scotland uses electric cooking in the restaurant coaches and is about to convert other kitchen cars to electrical working. Here, again, there are a number of points which could be brought out to show why something so efficient and up to date as to be capable of rendering outstanding service under what are probably the worst imaginable conditions for cooking should give an even better account of itself in Mrs. Smith-Jones's kitchen.

Although I have mentioned the point before, it is well to repeat that specialised advertising, i.e.—of a few related items, rather than a mention of as many different things as can be squeezed into the available space—should always be reflected in the advertiser's show windows.

If electric suction cleaners and electric floor polishers are being advertised the windows should contain a special display of these appliances, and so on through the whole range of the stock.

Many electrical contractors now realise the advantages which specialised windows have over the hotch-potch, closely dressed windows, but there are still many more who continue in the old way, fearing that if the windows do not contain a fully representative selection from the whole of their stock, somebody looking in the window and failing to see the particular article he wants will conclude that it is not stocked at this particular shop.

I do not wish to enter into the deatils of window display, a subject on which others are more qualified to speak, but I would particularly urge that, from the advertising point of view, special attention should be paid by retail advertisers to the synchronisation of specialised windows with specialised newspaper advertisements.

Telling the Sales Staff.

Another point—one that would seem elementary had one not had experience over and over again of a complete disregard of it—is that when special attention is drawn in advertisements to a particular appliance or appliances, the salespeople in the shop should be made aware of the fact, and also of the arguments on which the appeal to the public's purse is based. Otherwise a customer, having read in the paper that a certain article is particularly desirable, comes to the shop and asks for it, only to find that the salesman knows nothing about it. The impression thus created is, of course, not very favourable, and it is not unlikely that the customer will depart feeling that he has been tricked; or, at any rate, that the advertiser has been exaggerating the merits of his goods in print.

Before leaving the window question it may be suggested that, when the advertiser has taken the trouble to synchronise display with advertising, the advertisement should contain some statement to the effect that the goods referred to can be seen in the advertiser's windows during a definitely specified period.

The question, "Do people read newspaper advertisements?" is one that occurs to advertisers and non-advertisers alike. The latter, perhaps, furnish a negative reply to excuse their lack of enterprise, and some of the former, though doubtful, are willing to run the risk. Naturally the reply to the question depends very largely on what is in the advertisement. Some advertisers' announcements would, by their perfunctory statements and appallingly bad arrangement, repel the most attentive reader; others, again, would catch the eye and ultimately convince the most inattentive and casual persons imaginable.

The proprietor of a large Berlin store which has a considerable advertising expenditure thought of a novel way of deciding whether his advertisements were read. He inserted in various papers a number of small advertisements in which were contained a certain amount of incorrect information and wrong dates of historic events. He mentioned, for example, that Napoleon was born in Cyprus, and that the Battle of Waterloo was fought in 1814. Within a week of publication, according to a Central News message, he received no fewer than 400 letters drawing attention to these historical lapses. The writers included a large number of schoolboys and girls, professors, teachers, clergymen, farmers, and even some writers of international repute.

The advertiser was himself surprised that such small announcements had been so carefully scrutinised, and he was much interested to compare the number of communications relating to the different papers used, and the class of their readers. The question was clearly answered in the affirmative, but whether this knowledge was worth the mistrust with which the writers of the 400 letters—and possibly of many more who did not trouble to write—will view any future statements made in the advertisements issued by this store, is rather an open question.

A feature of this test which is of definite practical interest to the advertiser using small spaces is that even the very small announcements are read—if they are interesting. Far too many of the small-space advertisers fill their tiny spaces in a perfunctory way because they feel that ambition is out of place on such a narrow stage. They must rid themselves of this delusion, for though, up to a point, it may be accepted that the bigger the space the better are the results, so much depends on the use which is made of it, that the small space user may, by making more intelligent use of this little area, achieve better results than the full-page advertiser who thinks that size alone is all-sufficing.

A False Economy.

Many people who use big spaces seem to suffer from fear of white spaces—they hate an empty space, and because they have paid good money for it, take care to see that it is as tightly packed as possible. This is false economy, for when there are so many advertisers competing at the same time for the reader's interest, those who make it easiest and most attractive for him to find out what they are trying to sell will have a decided advantage over those who emulate the sardine-packer.

But even when serious over-crowding is not indulged in, the big space advertiser, still feeling that he ought to use as much as possible of the space he has bought, sometimes uses a lot of unnecessary verbiage as "padding"—just to fill out the space. This too, is a mistake, for, with few exceptions, the shorter and simpler the terms in which the announcement is conveyed the more likely is it to be read—and acted on.

The majority of advertisements contain too many words; very seldom does any contain too few. In this connection, one may appropriate Mark Twain's story of his attendance at a charity service conducted by an eloquent but long-winded preacher. The initial appeal for funds went to everybody's heart, and Mark himself was so touched that he simply itched for the plate to come round in order that he might give the 100 dollars which he had in his pocket. But the preacher, unaware that his aim was accomplished, went on and on, the air grew hotter, Mark grew sleepier, and his enthusiasm went down several dollars a minute. At long last when the sermon finished, and the plate came round, he took ten cents out of it!

The use of illustrations in advertisements is really a matter worthy of an article to itself. Briefly, however, it may be said that a picture that does not help digestion of the wordy meal is not worth including, but that a good illustration, suitably reproduced, is a definite asset in most newspaper advertisements.

A curious point must be here noted. To the average engineering mind the picture of, say, an electric cooker, showing every possible detail of construction is the type best calculated to include in an advertisement. Actually—and it has been proved over and over again—the most effective advertisement picture of an electric cooker places the details of the cooker more or less in the background and concentrates on presenting a daintily dressed housewife who is obviously finding electric cooking to be great fun. The girl using the "Thor" combination washing and ironing machine, reproduced by courtesy of the Edison Swan Electric Co., in Fig. 1 is an excellent example of the style of illustration to aim at.

Humour in Advertising.

Humour in advertising needs very skilful handling if it is to be a real success. Of the many dangers associated with it is that of making it so funny that any selling point will be lost; at the other extreme is the fun which fails to materialise, and stamps the advertiser as a dull dog.

Just the right degree of humour is contained in Mr. Parsons' announcement reproduced in Fig. 2. Both copy and illustration are of a high standard of excellence, and the ease with which the entire message can be read, even in its reduced size (the original was 7¼ in. by 9½ in.), is especially noteworthy. The appearance of this announcement would have been improved by a doubling or thickening of the top and bottom sides of the rule border.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Light's Golden Jubilee."

[To the Editor.]

Sir,—The protests which have already appeared in your columns have slipped off our American friends like water off a duck's back. I believe that in American schools no history exists between the death of Columbus and the birth of Washington, but there is no reason why the rest of the world should accept the hiatus.

In the same way the American public is being taught that no electric lamp existed before Edison's, but, again, there is no reason why the rest of the world should not consider the truth.

The name of Edison is as much revered in this country as it is in America, and an Edison jubilee would be most heartily supported by Englishmen. But we do not forget that the true jubilee of the electric lamp was celebrated by us last year, and that it was coupled with the name of Swan, who had already made carbon filaments and mounted them in vacuo twenty years before Edison ever began to study the problem.

In December, 1878, Mr. Edison had given up carbon as hopeless, and was experimenting with filaments of platinum and alloys of platinum. Swan exhibited in Newcastle-on-Tyne his first carbon filament incandescent lamp. A year later Edison, having reverted to carbon, succeeded in showing the Americans what Swan had already demonstrated in England, namely, the practicability of making a durable lamp with a carbon filament.

The form of filament which Swan devised in the following year, a filament made by carbonising parchmentised cotton thread, was the form of filament which Edison, after a brief experiment with other materials, such as strips of carbonised bamboo, adopted as the staple filament for the lamps which bore his name.

The squirted filament which Swan devised some years later as an improvement on the parchmentised cotton filament was also incorporated in the Edison lamp, and was universally adopted as the standard method of filament manufacture. This form of carbon filament held the field until it was superseded by the metal filament, due to the successive inventions of Auer von Welsbach, who introduced the osmium filament, Messrs. Siemens, who produced the tantalum filament, and Messrs. Just and Hanaman, who were the patentees of the earliest type of tungsten filament. The gasfilled incandescent electric lamp, as is well known, is due to the gifted American, Langmuir.

On what ground, then, does America ask for international recognition of Edison as the inventor of the incandescent electric lamp, by coupling his name, and his alone, with this "Golden Jubilee of Light"?

If it is the invention of the carbon filament lamp that is being thus commemorated, it is undoubtedly the name of the Englishman, Sir Joseph Swan, that should be honoured.

It is to be hoped that the representative electrical institutions of the various countries which have been invited by the N.E.L.A. of America to co-operate in this celebration, will, if they do not already know the history of this invention, take steps to acquaint themselves with the facts before acceding to this request.

They cannot do better than read the very exact account of the invention given by Mr. James Swinburne, F.R.S., to the Institution of Electrical Engineers on December 21st, 1928, on the occasion of the commemoration by the Institution of the 50th anniversary of the invention of the carbon filament incandescent electric lamp by Sir Joseph Swan.—I am, etc.,

R. K. Morcom.

London. August 9th.

[To the Editor.]

Sir,—Your references to the propaganda of the N.E.L.A. in "telling the world" what is only a half-truth about the invention of the incandescent electric lamp prompts me to ask why the British Electrical Development Association—our organisation most nearly corresponding to the N.E.L.A.—has not so far taken any noticeable part in this international controversy. When even the severely professional Institution of Electrical Engineers feels it a duty to direct American attention to the British viewpoint, it seems strange that our propaganda organisation has not seen fit to take up the cudgels in defending the memory of one who was largely responsible for giving that association something to develop. You may be interested to know that the American story has not only circulated through most of the countries of the world, but was also repeated with much flourishing of trumpets in an English weekly paper with a popular circulation.—I am, etc.,

"Disgusted."

Bristol. August 13th.

[A letter drawing attention to Swan's work, signed by Dr. S. Z. de Ferranti as President of the E.D.A., was published in the "Daily Telegraph" recently.—Ed.]

"New Wiring Plan."

[To the Editor.]

Sir,—Having seen the remarks on page 172 of The Electrician for August 9th, regarding Prof. Edward Bennett's proposed substitute for the 3-wire system, may I take this opportunity of placing on record that the same system has for some time past been proposed by the writer and is illustrated and mentioned in detail towards and at the end of Chapter VII of his forthcoming book, "Electricity Supply Transformer Systems," now in page-proof form. The writer not only proposed one insulated copper wire per circuit, but also one terminal per lamp socket and/or domestic appliance. The non-current carrying parts of the installation are effectively and properly earthed *at one point* (of respective installations) through the non-insulated return wire or the non-insulated metal conduit which form part of the return circuit. In the writer's opinion, this is the only sure and positive method of providing "safety for the public," and it has the additional advantages of cost and losses referred to by you.

Wiring installations based on present-day Regulations do not provide a cure for the public from circuit hazards and dangers. The true cure is partly left to the consumer and the public. That is to say, safety to life at present depends upon the consumer and the public; yet, we, as a specially trained body in this particular class of work, knowingly permit and deliberately provide for hazards to life. The least of the several possible dangers to life is from a direct contact with, say, the non-current carrying part of a house or factory 230 V (a.c.) fitting. The real cure provides that this said part be *always* effectively earthed *on the consumer's premises*.

The hazards cannot be definitely overcome and made foolproof from the public until the neutral wire of every installation is *properly* earthed and the non-current carrying part of the fitting or appliance forms part of the effectively earthed circuit. To have one earth connection at the supply end only, and then to earth each fitting independently is not much unlike laying a trap for the public to unknowingly and accidentally fall into at some time or other—it is not a cure, and the provisions are not really and truly safe. In view of this condition, are we to blame the consumer, the Postmaster General, the wiring installation, the electric supply system, the law, or the profession?—I am, etc.,

William T. Taylor.

London. August 10th.

Where *is* that Battery?

[To the Editor.]

Sir,—Your editorial on the electric vehicle is in every way excellent, but it does not—like Homocea—"touch the spot," and that spot is the battery.

I respectfully suggest that the battery makers are now too rich to be worried about the traction battery. Before the war they were a poor crowd, disunited and scrambling for scraps of business from central stations and a struggling motor-car industry. The war crammed them with submarine battery orders at profitable prices. Since the war a revival of the pleasure and commercial car industry, a new and vigorous radio trade, an active and constant flow of business from electric supply services, and a fresh fountain of orders from "talkies," "totes," and telephones have strained the battery producing factories to their limits.

Why step aside from so useful a field in which to garner profits, long delayed, to do research work of a rather troublesome order, which would give to the world the traction battery for which it has waited so long?

Central stations will certainly use battery electrics in the way you suggest, but, on the score of first cost, flexibility, speed and general utility, the petrol machine—odoriferous as it always will be—must have preference.

Let the battery makers get busy before the oil kings with their "stink wagons" assume complete command of road transport.—I am, etc.,

"Battery Electric."

London, S.E.19.

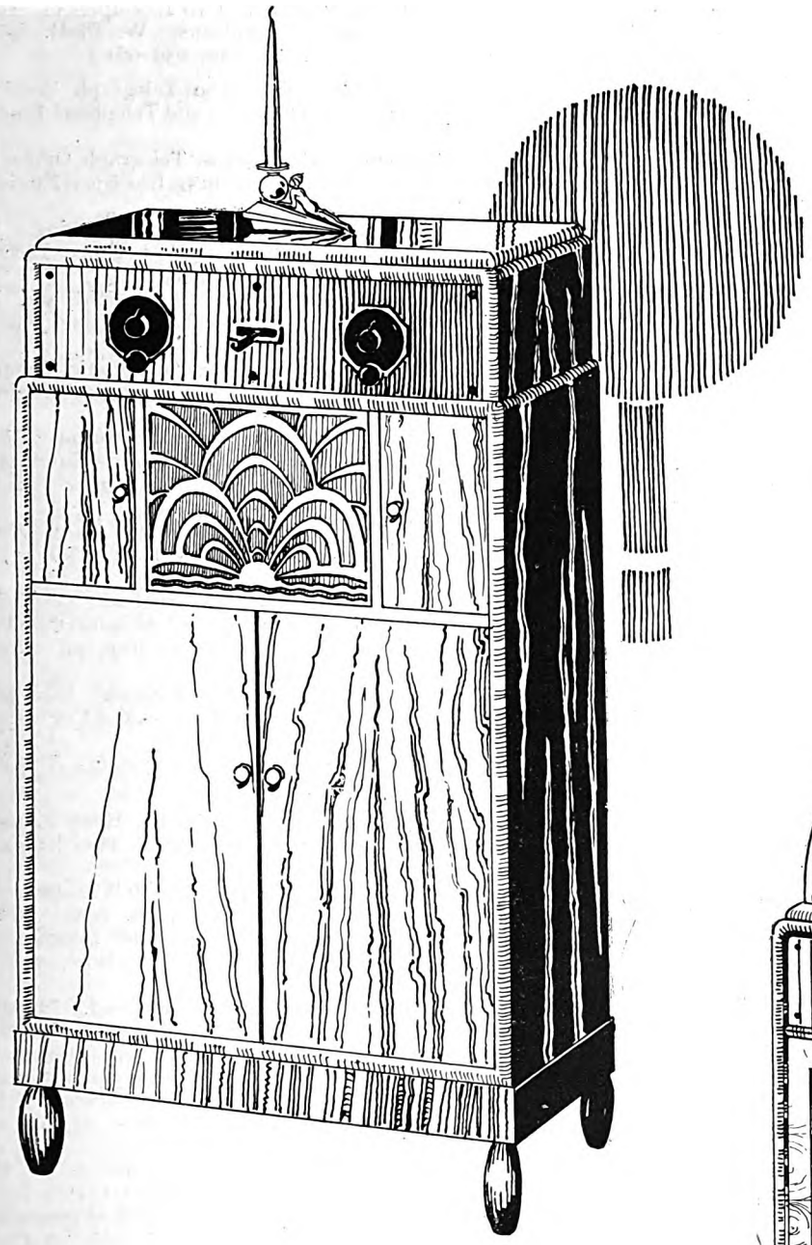
DESIGNS FOR WIRELESS RECEIVER CABINETS.

MANUFACTURERS of wireless receiving sets for domestic use realise that the housing of the equipment is in many cases as important a consideration with the purchaser as the performance of the receiver. From the crude rectangular box of the early days, wireless cabinet design has passed through the "camouflage" stage to the more satisfying point at which it becomes part of the furnishings of the house, without any undue attempt to conceal its purpose. The two contemporary designs illustrated on this page are reproduced by courtesy of "The Cabinet Maker."



TO the left above is a cabinet in Macassar ebony and Padouk. Panels and ends are veneered in Macassar ebony, with Padouk beads, plinth and knobs. The fret is veneered Padouk on plywood, and is backed with ivory silk. It is finished with a brilliant French polish, slightly rubbed off. Cupboards flanking the speaker accommodate batteries, and the cabinet measures 2 ft. 2 in. wide by 4 ft. high.

The other design, of eighteenth century inspiration, is in walnut. The door panels are veneered with quartered figured walnut and the stiles have oyster shell walnut veneers. The moulds and beads are cross-banded, and the fret is backed with old gold silk. A shelf is provided at the top of the cupboard for batteries. Measurements are 1 ft. 10 in. wide by 4 ft. 9 in. high.

NEWS IN BRIEF.

Whale Killing by Electricity—The 26th Ack Acks and Camp—The Marking of Imported Wireless Sets—The Opening of Hams Hall Station.

DERBY Town Council has decided to heat the Queen Street Baths electrically at a cost of £2 055.

Hull Electricity Committee has allocated £25 000 from surplus revenue for the purchase of apparatus for hire.

The Sidcup and Chislehurst Telephone Exchange was damaged by fire last week and put temporarily out of action and some plant was destroyed.

The City of London Corporation is about to spend a sum not exceeding £500 on the provision of a stand-by supply of electricity for the Guildhall.

London County Council invites applications for the position of electrical engineer in its Tramway Department.

Glasgow Corporation is taking a stand at the Housing and Health Exhibition, to be held in the Kelvin Hall in September.

Imports of electrical goods and apparatus into the Irish Free State during June last amounted to £49 626, as compared with £35 068 during the corresponding month last year.

Probationary assistant engineers are required in the Engineering Department of the Post Office. Forms of application, etc., from the Secretary, Civil Service Commission, Burlington Gardens, London, W.1.

A probationary engineer is required in the Federated Malay States Posts and Telegraphs Department. Further particulars from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1. (Reference M./1 658.)

Eastbourne Electricity Committee has further considered the possibility of establishing a scheme for the wiring of premises and the sale of fittings on a hire purchase system, and has decided to ask the borough treasurer and electrical engineer to submit a report on the matter.

The Borough Engineer of Ilford has submitted to the Electricity Committee sketch plans, prepared in collaboration with the Borough Electrical Engineer, of the proposed new offices and central show and store rooms on the Clark's Road site. Further detailed plans and estimates are to be prepared.

A Norwegian civil engineer, M. Holm Hansen, is reported to have invented a harpoon through which is transmitted electricity at a pressure of 76 V. The invention has been tried successfully for killing whales off the Faeroe Islands. This new method is said to be more economical than the older methods.

It is stated that Canadian firms are likely to be awarded most of the contracts for the construction of the new $7 500 000 power plant of the British Columbia Electric Railway Co. on the Stave River, near Ruskin, B.C. Contracts for the first unit to develop 42 500 H.P. at a total outlay of $680 000 have all been let to Canadian firms.

Siemens Lamp Works Staff entertained members of the Preston Electricity Department at Ashton Park on July 25th. Matches at golf and bowls provided some very close games and resulted in wins for Siemens by 4½ matches to 2½ at golf and 5 matches to 3 at bowls. An impromptu smoking concert which followed completed the evening.

Arrangements for the Düsseldorf meeting of the Institute of Metals are now complete. Over 200 persons from ten different countries will attend the proceedings, which will open on September 9th. The annual autumn lecture will be given by Dr. A. G. C. Gwyer, on "Aluminium and Its Alloys." Tickets may be obtained on application to the Secretary, 36, Victoria Street, London, S.W.1.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated August 16th, 1879:*

We suggested the use of portable lighting plant for harvesting by night.

After a public demonstration of gas and electric lighting in the Picton Reading Room, Liverpool, it was decided to adopt electric lighting.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of August 19th, 1904, stated that:*

The deficit on the year's working of the Pacific cable was over £88 000.

There were 15 632 subscribers to the Post Office London telephone system.

* * *

FIFTEEN years ago it was recorded in THE ELECTRICIAN *dated August 14th, 1914, that:*

Several important German radio stations had already been put out of action.

The virtual disappearance of commercial vehicles and horses led to a phenomenal demand for electric vehicles.

Many electrical manufacturing firms with large orders for Government supplies were hard put to it to carry on owing to the large numbers of workpeople called to the colours.

* * *

TEN years ago THE ELECTRICIAN *for August 15th, 1919, reported that:*

Metal and chemical prices were phenomenally high. Copper was £107 per ton.

Increases in the cost of coal caused many electricity supply undertakings to raise their electricity charges, in some cases by as much as 20%.

There are in York 153 all-electric houses.

The Great Western Railway Co. has decided to convert the steam-driven pumping plant at Bath to electrically-driven plant; and electric clocks are to be installed in the new station buildings at Newport.

Automatic road traffic signalling apparatus was put into operation last week at the junction of Old Town Street and Treville Street, Plymouth. The equipment has been supplied for a month's trial before purchase.

Manchester Corporation requires a resident engineer at Barton power station.

Manchester Corporation will be exhibiting at the Smoke Abatement Exhibition to be held in November.

One of the attractions at the South Shields Carnival being held this week, is an illuminated and decorated tramcar.

An exhibition of electrical domestic appliances was held at Freckleton recently and considerable business was done.

The Hams Hall station of the Birmingham Corporation will be opened by the Duke and Duchess of York on November 6th.

The Standing Committee appointed by the Board of Trade will hold an inquiry at 11.30 a.m. on September 30th, and at 10.30 a.m. on October 1st, as to whether imported wireless receiving sets, components and accessories should bear an indication of origin. The inquiry will be held at the Board of Trade Offices, Great George Street, London, S.W.1. Communications should be sent to the secretary, Mr. E. W. Reardon, at that address.

The 26th Anti-Aircraft Battalion, R.E. (London Electrical Engineers) T.A., which is under the command of Lt.-Col. M. G. Bland, will on Sunday go into camp at Manston, near Ramsgate, for the annual summer training.

Improvements are being carried out at the premises of the North Western Electrical Development Association in Fountain Street, Manchester, and when these are completed will considerably facilitate the work which is undertaken by Mr. R. C. Hawkins to amplify by local endeavour the work of the national E.D.A.

London County Council Mental Hospitals Committee recommends the installation of electrical equipment at Hanwell Mental Hospital, at a cost of £23 000. The institution is at present supplied with gas manufactured at the hospital, but the Committee thinks it advisable to have electricity for the purposes of electrical treatment of patients, and for refrigeration, etc. It is proposed to take the supply from the Metropolitan Electric Supply Co.

A competition promoted by the Metropolitan Railway among its staff for the best display of flowers and shrubs on station platforms and adjacent banks has resulted in some exceptionally attractive displays. The stations awarded prizes are: Hammersmith, Northwick Park, and Chesham (first); Dollis Hill, Kilburn, and Stoke Mandeville (second); Neasden, West Hampstead, and Croxley Green (third); Ruislip Manor, Wembley Park, and Whaddesdon (fourth).

The Institute of Marine Engineers' annual examination for student graduateship and the accompanying diploma, open to graduates or others not yet associated with the Institute, will be held on April 7th—10th next, at centres arranged to suit candidates. The examination for the Lloyd's Register Scholarship, value £100 per annum and tenable for three years at an approved university, will be held on May 12th—13th next, at various centres.

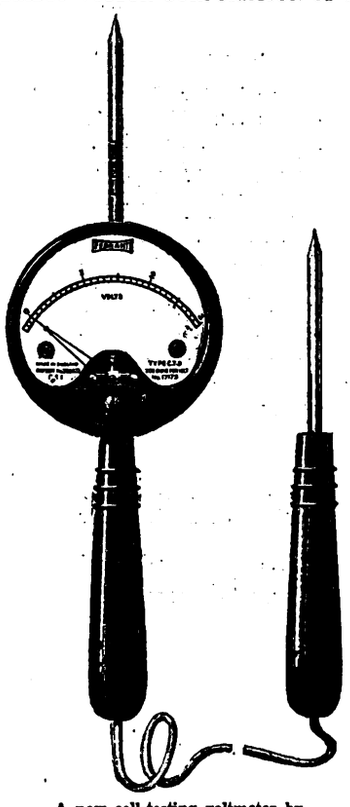
DOMESTIC ELECTRICAL APPLIANCES.

Special Cooking Utensils for Hotplates—A Portable Receiver of American Design—New Measuring Instruments—Illuminating Glassware and Pendants.

A NEW receiver, employing an improved a.c. superheterodyne circuit, and enclosed in a console cabinet with an electro-dynamic loud speaker, has been introduced by the RADIO-VICTOR CORPORATION OF AMERICA. The circuit used in the new receiver includes a tuned aerial coupling circuit, one stage of h.f. amplification, oscillator, first detector, two stages of intermediate frequency amplification, second (power) detector, and one stage of audio frequency amplification. The single tuning control operates a new type of stencil cut selector dial by means of which illuminated scale markings from 0 to 100, as well as approximate kilocycle markings, are projected on a translucent composition screen and magnified for easy reading. The cabinet is of two-tone walnut veneer, with burled maple overlays. The loud speaker opening and control panel are covered with cut velours. The pattern of the material has been arranged so that the controls appear to form a part of the design.



A new cell-testing voltmeter by Ferranti Ltd.

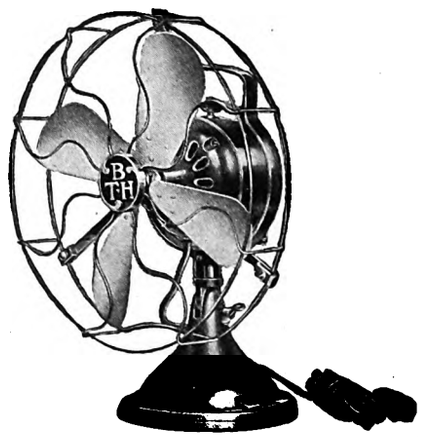
FERRANTI LTD., has introduced a new cell testing voltmeter. The instrument consists of a 2½ in. dial 2½ in. scale moving coil voltmeter mounted on a special base and fitted with handles and spikes for the convenient testing of battery cells. The instrument is of B.S.S. first grade accuracy and consumes only five milliamperes for full scale deflection. It can be supplied with a reading of 0—3 or 3—0—3 V. On the 0—3 V scale provision is made for a negative reading of 0—0·3 V (marked in red on the dial) to enable cadmium tests to be made in addition to ordinary tests. Robustness is an outstanding feature of the instrument and it has been designed to withstand unusually heavy overloads without injury. The instrument case is of non-corrodible insulating material, as also the two handles to each of which is fitted a rustless, non-corrodible spike, the handles being connected by a two-foot length of acid-proof flexible cable. If required, barbed-type spikes can be supplied instead of the single spike pattern illustrated.

One solution of the problem of obtaining the right kind of electric cooking utensils for use on modern hotplates is suggested by SIGG, LTD., of 469, Holloway Road, London, N. This firm manufactures a range of stewpans, kettles, frying pans, casseroles, porringers, etc., all of which are about ⅛ in. thick at the bottom, and which are machined perfectly flat. It is claimed that these utensils, being made in sizes which exactly cover the hotplates, absorb and retain the heat much more rapidly than the ordinary utensils such as are used for gas or open fires. The manufacturers point out that a pan with a thick bottom will—taking the mean throughout its life—boil quicker than a similar vessel with a thin bottom, because the latter will quickly warp and thus seriously decrease the thermal efficiency. The following is given by the firm as an example of the boiling rate of one of their kettles. "At a recent test 2 pints of water was boiled in an ordinary 16 gauge kettle and took 14 min. 7 sec. to boil, but the same quantity of water boiled in one of Sigg's "Inflexible" (¼ plate) "Leicester" machined flat kettles took only 11 min. 3 sec."

HAILWOOD AND ACKROYD, LTD., Beacon Works, Morley, near Leeds, and 32, Shaftesbury Avenue, London, W.1, have in their showrooms a good selection of glassware applied to electric fittings and advertising devices. Their products may be classified in two sections—artistic glassware in choice and costly designs, and mass-produced articles priced low enough to compete with similar foreign glass. There are many extremely attractive fittings falling in the first division, and also a good variety of cheaper models. The makers believe in imparting as cheery a tone as possible to their designs, so that the occupants of a room decorated with "Hailglass" illuminants may feel at their best at all hours of the day, in addition to being free from eye strain during the night season. Much of the glass produced by this firm is painted with ceramic colours, fired in; this decorated glass is washable. A speciality is making up fittings to the customer's own registered designs, the moulds being kept solely for the owners. Coats of arms, views of historic buildings, scenic gems, etc., can be reproduced on standard lamps or illuminated vases in accordance with the wishes of the consumer. A special department is devoted to advertisement glassware. In this field are included such familiar things as the globes surmounting petrol pumps and decorative entrance and exit signs for theatres. Flesh-coloured glass legs for shops selling stockings are another typical item. Some of the advertising fittings are constructed of three-ply glass, which consists of a thin layer of opal glass between two layers of clear. This method is claimed to eliminate glare without lessening intensity to the extent often experienced when other diffusive constructions are used. Three-ply glass can also be supplied with the inside and outside surfaces satin-polished; or, to give further variation, the inner layer may be yellow, rose or any other tint. Other forms of glass manufactured are etched and engraved, opaline, opalescent, matt frosted (produced by acid or sand blasting according to circumstances) and "Hailuxo," a clear, hard glass with good heat-resisting properties.

Among the newest additions to the range of lighting pendants manufactured by the GENERAL ELECTRIC CO., LTD., (Magnet House, Kingsway, London, W.C.2) are a number of fittings incorporating bakelite accessories. Bakelite ceiling roses, galleries and lampholders take the place of the more common porcelain roses and metal galleries and holders. They are supplied in lustrous oak finish, and should harmonise with most surroundings. A special feature of bakelite for these applications is that it will always remain clean and fresh looking. It is suggested that the fittings are very suitable for hospitals and institutions as well as for use in the home.

A useful device, which costs only a few shillings and is described as an aerial discharger, has been placed on the market by PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2. Many listeners earth their aerial every night during the summer, so as to reduce any possible danger during a thunder storm. It should, however, be remembered that during a rain or hail storm it is again possible for the aerial to become charged, and it is advisable to provide an easy means for this to escape to earth, without passing through the receiver. The discharger under review is designed to automatically prevent lightning or other atmospheric discharges from damaging a receiving set, and consists of a tube, full of a rare gas, and a spark gap, protected by a glass tube and a porcelain cowl. A galvanised iron bracket is attached, so that it is easy to fix it to the wall of the house, near the aerial lead-in. The device needs no attention, and the makers state that during unsettled weather it can sometimes be seen to function by the momentary glow in the tube of gas.



A popular electric fan model by the British Thomson-Houston Co., Ltd.

PERSONAL.

MR. Richard L. Brown has been appointed deputy managing director of Hopkinsons, Ltd.

Gillingham (Kent) Town Council has appointed Mr. E. T. Howell, of Fulham, as mains engineer.

Sir Arthur Dorman, chairman of Dorman, Long and Co., celebrated his eighty-first birthday on August 8th.

Among those injured in a motor smash at Le Creusot on Monday was Mr. Mark Van Os, a director of M.S.L., Ltd.

Mr. Wilbur B. Huston has won the scholarship which Mr. Edison offered to an American undergraduate who gave the best answers to 50 questions drawn up by the inventor.

The marriage of Mr. C. F. J. Morgan, of the research department of Metropolitan-Vickers Electrical Co., Ltd., and Miss Winifred Allen was solemnised at St. Paul's Church, Crewe, on August 5th.

Mr. Frederick Giles, of St. Albans, on completing 20 years' service with the North Metropolitan Electric Power Supply Co., at their works at St. Albans, has been presented with a wallet containing £20.

Mr. E. W. Dickinson, private technical assistant to Sir John Snell, chairman of the Electricity Commission, has been appointed to act as technical officer in connection with the development of electricity in rural areas.

Mr. R. W. Smith, for some years engineer at the Bedale electricity works, has been appointed engineer of the electricity works at Bedale, Masham, and Thirsk, which are now controlled by the Cleveland and South Durham Electric Light and Power Co.

Sir Ernest Benn, chairman of Benn Brothers, Ltd., proprietors of THE ELECTRICIAN, presided at Tuesday's public session of the International Advertising Congress in Berlin. Mr. R. D. Savage, manager of THE ELECTRICIAN, is one of the English delegates.

Mr. J. S. Highfield's "Dorina" was the winner in a handicap race in the Royal Yacht Squadron's Regatta at Cowes last Thursday. A cutter-rigged boat of 50 tons, the "Dorina" won two events during the week, and she also won the Ryde Town Cup in a handicap for yachts between 35 and 70 tons at the Royal Thames Yacht Club's Solent Regatta on Monday.

The "Revue Générale de l'Electricité," of August 3rd, contains an appreciation by M. André E. Blondel, of M. Edouard Labour, the eminent French electrical experimentalist and inventor, who died in November, 1928. M. Labour was the originator of the scheme for the high-tension network which was organised by the Minister of Public Works after the war.

Obituary.

MR. J. C. WARD, on August 8th. He was a director of Edgar Allen and Co.

MRS. E. M. BARNETT, on July 31st after an illness of a few days duration. She was senior cooking and heating demonstrator for Metro-Vick Supplies.

MR. JAMES JEFFERY, on August 6th, chairman of the Ross Electric Light and Power Co., Ltd., and formerly a director of the Dumfries Electricity Supply Co.

PROF. E. M. TERRY, on May 1st, aged 50 years. He was associate professor of physics in the University for Wisconsin and was known for his work on the effect of temperature on the magnetic properties of iron, cobalt and nickel. He also did valuable work in the development of radio telephony.

MR. SAMUEL M. KENNEDY, on July 18th, aged 66 years, retired vice-president of the Southern California Edison Co., who did much towards the development of the electrical industry on the Pacific Coast. He was at one time resident manager in London for a Canadian wholesale importing business.

MR. THOMAS E. MURRAY, on July 21st, aged 69 years. He was largely concerned with the growth of the New York Edison Co. and the United Electric Light and Power Co. To his skill as a builder of power plants are due in a measure not only the plants of Greater New York—Waterside No. 1 and No. 2, Sherman Creek, Hell Gate, Gold Street, Hudson Avenue, East River and the Williamsburg street-railway power stations—but also steam plants in Albany, Utica, Rochester and elsewhere in New York and in Dayton, Ohio, and hydro-electric plants at Chattanooga, Tenn., and Cohoes and Trenton Falls, N.Y. Over the design of all these and various smaller generating stations he had supervision. His total installation being in the neighbourhood of 2 168 380 kW. It is said that he was granted more patents than any other man save Edison.

BUSINESS ITEMS.

THE MARCONIPHONE Co., LTD., 210/212, Tottenham Court Road, London, W.1, has received a letter from Mr. T. J. Ridgway reporting that using a Model 55 portable receiver the broadcasting of the arrival of the "Graf Zeppelin" at Lakehurst was successfully heard near Liverpool.

ONE of the new showcards which have been published in connection with the "Mazda" 1929-30 Lighting Season Advertising Campaign. We have received a number of illustrations of the new literature which has been compiled for the campaign, and details will be published in full in a later issue.

Included in a number of orders received recently by the HART ACCUMULATOR Co., LTD., Stratford, London, E.15, is one from H.M. Office of Works for a battery consisting of 120 "STC.17" type cells having a capacity of 800 Ah, to be installed in the Admiralty Research Laboratory at Teddington.

The Royal Sanitary Institute had an exhibition in connection with its annual congress held at Sheffield recently, and offered medals for those exhibits that reached a prescribed standard of excellence. The names of firms entitled to awards have just been announced by the chairman of the judges, Dr. Charles Porter, and these include the ACME ENGINEERING Co., LTD., Stocks Hill, Holbeck, Leeds, for an electrically heated fish-frying range, and HOOVER, LTD., 229–233, Regent Street, London, W.1.

Croydon Corporation has awarded to the ENGLISH ELECTRIC Co., LTD., a contract for the complete equipment of a new switch house. The installation, which is to the design and specification of Mr. A. C. Cramb, the borough electrical engineer, will be of the most modern type, and will include electrically-operated compound-filled switchgear of high-rupturing capacity, with a special arrangement of duplicate busbars. It will form the main control for the turbo-alternator plant, including a new 25 000 kW set, and for group feeders to the existing feeder switchgear. The contract is valued at £44 300.

The GENERAL ELECTRIC Co., LTD. has supplied to the Edinburgh education authority, two "Magnet" double deck baking ovens, designed and manufactured by the G.E.C. Birmingham works. These ovens have been installed in two well-known educational centres in Edinburgh, and they follow a similar installation completed some months ago at the Astley Ainslie Institute, Edinburgh. Large "Magnet" baking ovens are a prominent feature in the equipment of the National Schools of Bakery in London and Leeds, and have also been installed in the Colleges of Technology at West Ham, Manchester, Leicester, Glasgow and Doncaster.

OVERSEAS TRADE.

Electrical Exports for Seven Months Exceed Imports by over £7 000 000.

EXPORTS of electrical machinery, apparatus and material shipped from the United Kingdom during July were valued at £1 703 316, as against £1 410 980 for the corresponding month last year, an increase of £592 336. Electrical exports for the seven months of the year totalled £11 060 903, compared with £10 788 489 for the same period of 1928. The increase by comparison being £272 414.

Imports of electrical goods during July, 1929, amounted to £589 069, as against £485 605 during the same month last year, while for the seven months of 1929 imports totalled £4 052 074, or £601 065 more than for the same period of 1928.

The figures show that July exports were in excess of imports by £1 114 247, and during the seven months January to July electrical exports exceeded similar imports by £7 008 829.

With the exception of switchboards other than telegraph and telephone, various motors and generators other than railway and tramway motors, and batteries and accumulators, every export item showed an improvement, the largest being telegraph and telephone instruments, excluding wireless valves, which showed an increase of £100 749 when compared with last year's return of the same goods for July.

On the import side electrical machinery declined during the month under review by £12 205, switchboards other than telegraph and telephone by £3, and parts of arc lamps and searchlights, excluding carbon rods, by £2 292. With these exceptions every import item showed an increase. The following are detailed figures.

	Month of July.		Seven Months.

S.E. LANCS ELECTRICITY.

Annual Report of the South East Lancashire Electricity Advisory Board.

AT the last meeting of the South East Lancashire Electricity Advisory Board, held in Manchester, with Ald. W. T. Dagnall in the chair, the annual report for the year ended March 31st was adopted. The report deals with work carried out and says that it is interesting to review the development which has taken place since the creation of the Board in 1923. At that date there were 32 authorised undertakers operating in the district as compared with 40 at present. The increase by eight in the number of the authorised undertakers does not adequately express the extensions or development, because many undertakers have added to their area of electricity supply by taking in adjoining local government areas. The extent of the development is more appreciated from the fact that since 1923, Special Orders have been taken out by the then existing or new authorised undertaker affecting 16 local government areas, many of which are of a rural character covering wide areas. Having regard to the competition which exists in relation to the areas included in the Mid-Cheshire Company's proposal it appears to be reasonably certain that the whole of such area will be included in a Special Order or Orders at a comparatively early date. If these proposals mature, the position of the district will then be that 99·6% of the population of the district will be within the areas covered by Distribution Orders, and 92% of the acreage of the district will also be situate within areas covered by Distribution Orders; the main bulk of the undeveloped acreage being the easterly end of Cheshire and the northerly end of Derbyshire adjoining the Pennine Range, which areas are very sparsely populated. The Board consider that it is no exaggeration to say that such development has been, to a large extent, fostered by the activities of the Board, and particularly by the close investigation of all such proposals and assistance in relation thereto which has been given by the Engineering Advisory Committee.

The Board have given further consideration to the problems which may arise due to (1) the inability of a company to make a bulk supply contract for a period beyond the company's tenure, which would bind the purchasing authority, and (2) the inability of the purchasing authority to become party to such a bulk supply contract so as to bind themselves if and when they purchase the undertaking. The Board have been satisfied by legal opinion that the disability exists, and have suggested to the Electricity Commissioners that statutory powers should be conferred upon a purchasing authority to obviate the difficulties which might otherwise arise.

The increasing consumption of electricity in the district is shown by the following figures for units sold during the past seven years :—

	Units sold.
Year ending December 31st, 1922	479 076 857
,, ,, 1923	551 251 843
,, ,, 1924	632 369 490
,, ,, 1925	708 069 467
,, ,, 1926	729 617 774
,, ,, 1927	837 206 978
,, ,, 1928	891 290 039

The units sold per head of population in 1928, based upon the estimated population for that year, 3 100 000, amounted to 288 per head, as compared with :—

Year 1926	242 units per head.
,, 1927	273 ,,

The cost of administration for the year ending March 31st, 1929, amounted to £2 295 3s. 11d., which, when distributed over the units sold during the year, i.e., 891 290 039, yields a figure of 0·00062d. per unit.

At a recent meeting of Taunton T.C. the Electricity Committee's report, which shows a net profit of £5 086 on the past year's working, was adopted. It was decided to transfer £2 871 to reserve and £1 000 to the rate fund. It was announced that the Committee would reconsider the scale of charges at an early date. Ald. Kingsbury, chairman of the Committee, said they were somewhat disappointed that the public had not taken advantage of the concession with regard to assisted wiring to the extent which was hoped. Free wiring was something which the Committee could not promise. He congratulated Mr. A. J. Howard (the engineer) and the staff upon the successful result of the year's working.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

BINGLEY GRAMMAR SCHOOLS.—Installation of electric lighting. Plans and specifications from Mr. W. M. Platts, clerk, 1, Park Road, Bingley.

DEVIZES RURAL DISTRICT COUNCIL.—Electric light installation at 36 houses in Lavington district.

FARNWORTH URBAN DISTRICT COUNCIL, August 16th.—Supply of l.t. cables. Specifications, etc., from Mr. A. J. Hutchinson, engineer and manager, Electricity Department, Albert Road, Farnworth, Lancs.

LYMM URBAN DISTRICT COUNCIL, August 16th.—Supply and erection of vertical electrically-driven pump. Specifications from Mr. N. Holt, clerk, Council Offices, Lymm; deposit £2 2s., returnable.

UNITED METHODIST CHURCH, THEAKER LANE, ARMLEY, August 16th.—Electric light installation in church and Sunday School. Particulars from the Trustees' Secretary.

GLAMORGAN COUNTY COUNCIL, August 17th.—Additional electric lighting at Glamorgan Farm School, Ty, Segur, Neath. Plans, etc., can be seen at the schools or the County Architect's Office, Neath.

HULL CORPORATION, August 19th.—Electric light installation and fittings for portion of elementary school. Specifications, etc., from the City Architect, Guildhall, Hull; deposit £1 1s.

DUNDEE HARBOUR TRUST, August 20th.—Supply and erection of electric passenger lift at Harbour Chambers, Dock Street, Dundee. Specification, etc., from Mr. J. Hannay Thompson, general manager and engineer.

MANCHESTER CORPORATION, August 23rd.—Supply of steel tramway poles. Specifications, etc., from the General Manager, 55, Piccadilly, Manchester.

CENTRAL ELECTRICITY BOARD, August 24th.—Supply, delivery, and erection of metering equipment for certain stations in the area of the South-East England Electricity Scheme, 1927. Specification No. S.E.E.-G.M.1 from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit, £2 2s. for first copy, £1 1s. for each subsequent copy.

NEWCASTLE ENDOWED SCHOOLS, August 24th.—Electric light installation in a new wing to be erected at each of two schools, viz.: Newcastle-under-Lyme High School, and Newcastle-under-Lyme Orme Girls' School. Specifications, etc., from Messrs. Cramp and Frith, 1, Dickinson Street, Manchester; deposit £3 3s. in respect of one contract, or £6 6s. in respect of both contracts. Tenders are invited only from firms on the National Register of Electrical Installation Contractors.

COMMITTEE OF VISITORS OF GLOUCESTERSHIRE MENTAL HOSPITALS, August 26th.—Electric wiring of Wotton and Coney Hill Mental Hospitals, on "Stannos" earthed concentric system. Specification, etc., from Messrs. Handcock and Dykes, 11, Victoria Street, Westminster, S.W.1; deposit £2 2s.

POPLAR (LONDON) BOARD OF GUARDIANS, August 28th.—Supply and installation of e.h.t. switchgear, a 75 kW mercury arc rectifier, and l.t. d.c. switchboard at the Institution. Specification, etc., from Mr. G. Butler, clerk, 45, Upper North Street, Poplar, London, E.14; deposit £2 2s. returnable.

WESTMINSTER GUARDIANS, August 28th.—Electric lamps, fittings, etc. Forms of tender from the Clerk, Princes Row, London, S.W.1; stamped, addressed envelope to be sent.

STAPLEFORD RURAL DISTRICT COUNCIL, August 29th.—Electrical pumping stations, etc. in connection with Chilwell and District sewerage works. Specifications from Elliott and Brown, Burton Buildings, Parliament Street, Nottingham; deposit £3 3s.

MANCHESTER CORPORATION, August 30th.—Supply and delivery of one water-tube boiler superheater for Barton power station. Continuous actual evaporation of boiler, 130 000 lb. of water per hour. Specification, etc., from Mr. H. C. Lamb, chief engineer and manager, Electricity Department, Town Hall, Manchester.

WEST RIDING EDUCATION COMMITTEE, August 30th.—Electric light installation at Highfields School, Doncaster. Particulars from the divisional clerk, Mr. A. J. Dempster, 20, Christ Church Road, Doncaster.

BURY AND DISTRICT JOINT HOSPITAL BOARD, August 31st.—Supply, delivery and installation of electric refrigerator at (1) Florence Nightingale Hospital, Bury; and (2) Aitken

ONE of the departments at the Nottingham factory of Messrs. Wm. Hollins and Co., Ltd., spinners. This workroom, which measures 178 ft. by 60 ft., was originally illuminated by a system of local lighting units, suspended low down over the machine troughs. One reflector served two machines and was equipped with a 60 W lamp, giving an average illumination throughout of 2 ft.-candles for a total current consumption of 12·6 kW. Wm. Hollins and Co., Ltd., enlisted the advice of the General Electric Co., Ltd. with a view to improvement. The scheme, when submitted to actual test, proved so successful that arrangements were made to light the whole of the department with 14 in. "Geco" enamelled steel reflectors, fitted with 200 W gasfilled lamps. Only eighty-five reflectors have been installed, in lieu of 247 under the old system, with a resultant average illumination over the whole of the working plane and gangways of 10 ft.-candles. The current consumption is now 16·85, as against 18·2 kW.

Digitized by Google

Sanatorium, Holcombe. Specifications, etc., from Mr. F. Wild, clerk, 2, Cross Street, Bury.

WARRINGTON WATER COMMITTEE, August 31st.—Supply of electrically-driven centrifugal pumping plant. Forms of tender, etc., from Mr. J. Gray, water engineer, Warrington; deposit £2 2s., returnable.

HARROGATE CORPORATION, September 7th.—Supply and erection of overhead 11 000 V lines and 346/200 V lines. Specification, etc., from Mr. Neil McLean, borough electrical engineer, 33, Swan Road, Harrogate.

LONDON COUNTY COUNCIL, September 9th.—Supply and erection of e.h.t. switchgear, etc., for tramway sub-stations. Specifications, etc., from the General Manager of Tramways, 23, Belvedere Road, S.E.1; deposit £2.

LIVERPOOL CORPORATION, September 10th.—Electric power and lighting installation for new abattoir, Stanley, Liverpool. Specification, etc., from Land Steward and Surveyor, Municipal Buildings, Liverpool; deposit £3 3s.

CENTRAL ELECTRICITY BOARD, September 11th.—Supply, delivery and erection of 132 kV overhead transmission lines (approach to Clarence Dock, Liverpool). Specification No. N.W.E.-P.L.3, from Mr. R. H. Fox, secretary, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s., for first copy, and £1 1s. for each subsequent copy, returnable.

EAST LOTHIAN EDUCATION AUTHORITY, September 27th.—Electrical work in connection with erection of public schools at Longniddry and Aberlady. Forms of tender, etc., from Messrs. Morham and Brotchie, 29, Hanover Street, Edinburgh, on and after August 21st.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

SMYRNA MUNICIPALITY.—Construction and equipment of modern electric bakehouse. (Reference B. 5 572.)

YUGOSLAVIA.—Supply and delivery of two electric lifts for a local company. Reference A.X. 8 315.

CHILEAN STATE RAILWAYS, August 16th.—Material for overhead lines, underground cable and cable boxes (Group 41); and material for lighting of locomotives and carriages (Group 43). (Reference C. 3 069*.)

CHILEAN STATE RAILWAYS, August 16th.—Telegraph and telephone materials, including copper wire and cable, switches, table telephones (Ericsson type), telephone cords, etc. (Reference C. 3 072*.)

CHILEAN STATE RAILWAYS, August 16th.—Supply of instruments of staff or tablet type, for installation at 36 stations between Alameda and Talca, locking apparatus for switches, batteries and telephone combinations. Specification C. 3 070*.)

URUGUAY POSTS, TELEGRAPHS AND TELEPHONES, August 17th.—Supply of telegraph wire. (Reference A.X. 8 229.)

AUCKLAND ELECTRIC POWER BOARD, August 19th.—Single-phase transformers. (Reference B.X. 5 324.)

INDIA STORE DEPARTMENT, SIMLA, August 20th.—Supply and delivery of one 80 kW, 2-wire d.c. generating set for the Military Engineering Services, Razmak. (Reference B.X. 5 522.)

BELGIAN TELEGRAPH AND TELEPHONE DEPARTMENT, August 21st.—Supply of 250 tons of annealed bronze wire and six tons of annealed copper wire. (Cahier des Charges Special No. 3/424.) (Reference A.X. 8 346.)

JOHANNESBURG CORPORATION, August 22nd.—Supply and delivery of automatic traffic signals. (Reference B.X. 5 547.)

PORT ELIZABETH MUNICIPALITY, August 22nd.—One 10 000 kW turbo generator, and condenser, boiler, steam and feed water pipes, etc. (Reference B.X. 5 430.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, August 22nd.—Telegraph material. (Reference A.X. 8 335.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 22nd.—Extension magneto bells, bell sets, condensers, magneto generators, central battery switchboard tumbler switches, wall and table telephones, etc. (Reference B.X. 5 415.)

BELGIAN POSTS AND TELEGRAPHS, August 26th.—Telephone cables between Ghent and Antwerp, Liege and Combain-au-Pont, Verviers and Francorchamps, and Charleroi and Liege. Cahier des Charges (fr. 6¼) from the Post and Telegraph Department, Brussels.

INDIAN STORES DEPARTMENT, August 28th.—One 30 kW two-wire d.c. generating set. (Reference B.X. 5 522.)

JOHANNESBURG MUNICIPALITY, August 29th.—Copper weatherproof wire for overhead lines. (Contract No. 234.) (Reference B.X. 5 565.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, August 29th.—Supply of 3 000 lamp fittings. (Reference B.X. 5 534.)

COMPAGNIE DES CHEMINS DE FER PORTUGAIS, August 31st.—Mechanical or electrical apparatus for operating points and signals. (Reference A.X. 8 367.)

WATERFORD HARBOUR COMMISSIONERS, August 31st.—Light standards, poles, cables, lamps, etc. Specification, etc., from the Harbour Engineer; deposit, £2 2s.

PRETORIA CORPORATION, September 2nd.—Columns, fittings, lanterns, etc., for street lighting, and master clock for frequency regulation. (Reference A.X. 8 322.)

MAFEKING MUNICIPALITY, September 9th.—Steam raising plant, engines, alternators, switchgear, etc. (Contract "A.") (Reference A.X. 8 352.)

SOUTH INDIAN RAILWAY CO., LTD., September 20th.—Supply of electric goods, locomotives and battery tenders, in connection with electrification of Madras suburban services. Specifications, etc. (£1) from the company's offices, 91, Petty France, Westminster, S.W.1.

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 23rd.—Crude oil engine-driven 150 kW electric generating plant. (Tender No. 1 528.) (Reference B.X. 5 566.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 26th.—Two 100 kVA motor-alternators (tender No. 1 521). (Reference B.X. 5 564.)

DURBAN CORPORATION, September 27th.—Supply of three-phase ironclad, compound filled switch panels (specification S. 778). (Reference B.X. 5 505.)

MARLBOROUGH (N.Z.) ELECTRIC POWER BOARD, September 28th.—Supply and erection of 600 B.H.P. Diesel driven generating plant and switchgear. (Reference B.X. 5 556.)

STATE ELECTRICITY COMMISSION, VICTORIA, September 30th.—Supply and delivery of three 3 000 kVA 50 cycle, oil immersed, self-cooled, outdoor type single phase transformers and spare coils and bushings. (Reference B.X. 5 523.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Three 3 000 kVA transformers and spares. (Reference B.X. 5 523.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply, erection and maintenance of coal conveying plant. Specification (No. 29/68) from the Agent-General, Victoria House, Strand, London, W.C.; deposit £2 2s.

Tenders Accepted.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Siemens Bros. and Co., Ltd., supply of cable, £7 934 6s. 2d.

CAPE TOWN CORPORATION.—Measurement, Ltd., supply of 500 meters, £2 9s. 6d. each. (Recommended.)

POPLAR (LONDON) BOROUGH COUNCIL.—Electroflo Meters Ltd., supply of instrument equipment, £1 236.

LEICESTER CORPORATION.—Aiton and Co. for steam and feed pipe connections at the power station, £1 936, amended.

CAPE TOWN CORPORATION.—South African General Electric Co., Ltd., supply of brackets, fittings, etc., in connection with street lighting extensions, £1 782 17s.

WORTHING CORPORATION.—Callender's Cable and Construction Co., Ltd., cable work and supply and fixing of network and joint boxes, etc., for the supply to the Findon Valley estate, £1 212.

CROYDON CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., turbo-alternator, with condensing plant, pipework, auxiliaries, etc., £76 851. English Electric Co., Ltd., switchgear, £44 227 10s. Babcock and Wilcox, Ltd., steam raising plant, £101 712.

BIRMINGHAM CORPORATION.—The Harland Engineering Co., Ltd., for switchgear at five sub-stations. J. H. Payne and Co., installation of apparatus for electric lighting at Deykin Avenue school. The General Electric Co., Ltd., provision of frequency changer equipment and switchgear. The General Vehicle Co., Ltd., supply of three electric vehicles for the salvage department.

HULL CORPORATION.—Electrical wiring for cookers and wash boilers at 12 houses each on the North Hall and the Willerby Estates:—Messrs. H. M. Nowell, £40 5s. at North Hall and Messrs. Holliday and Barker, £56 at Willerby. Keighley Electrical Engineering Co., Ltd., provision of an electric lift at the central library, £2 410. W. F. Dennis and Co. for bronze for telephone use at £80 12s. 6d.; T. Bolton and Sons, Ltd., for lead-in cable at £329 1s. 7d. Clarke, Chapman and Co., Ltd., supply of five seats of soot hoppers, £1 263.

ELECTRICITY SUPPLY.

Public Lighting at Witham—Ballymena Supply Scheme—New Plant for London County Council and Stalybridge, &c., Board—Central Electricity Board's Accounts.

TORQUAY Electricity Committee is to extend overhead lines at a cost of £560.

Hastings Electricity Committee is to extend mains to supply the Beckley district.

THE decision of the Otley Council to light all their streets electrically has presented an opportunity to all householders where the mains are being laid to have electric light facilities, and where houses are not wired to have the wiring done without any initial payment on the system which is now so popular in Leeds and other places. The interest taken in this development by the inhabitants is illustrated by the above photograph, sent to us by Mr. W. B. Woodhouse, engineer and manager of Electrical Distribution of Yorkshire, Ltd., of people reading about the scheme on leaving their work at a local factory.

Hull Electricity Committee is to extend the meter and mains depot in Argylle Street.

Kendal T.C. has received sanction to a loan of £4 142 for feeder and distribution mains.

Plymouth Electricity Committee has authorised mains extensions at a cost of £1 100.

Sheffield Electricity Committee has acquired a site at Dore for the erection of a sub-station.

Merrington (co. Durham) Parish Council is to provide electric street lamps at a cost of £900.

Ripon Electricity Committee is to obtain tenders for carrying out distribution works at Bishop Monkton.

Colchester Electricity Committee is arranging for street lighting in the districts of Wivenhoe and Thorpe.

Leeds Electricity Committee is to purchase land for sub-stations in Queen's Road and in Mosley Wood Lane.

The Slough and Datchet Electric Supply Co. is to erect a transformer chamber at North Lodge, Stoke Poges.

Berkhamsted R.D.C. has decided to offer no objection to the proposed overhead line from Luton to Aylesbury.

York Corporation has obtained sanction to borrow £1 460, for rectifying plant for Groves electricity sub-station.

Ashford (Kent) Urban Council has applied for a loan of £2 084 for extensions to the East Ashford rural district.

Winchester City Council has applied for a loan of £3 780 for a new feeder cable from the power station to the Guildhall.

Walsall Electricity Committee has authorised the extension of mains to supply Corporation housing schemes at a cost of £2 600.

Durham County Mental Hospital Committee is to instal a new feed pump at the generating station of the mental hospital.

Sheffield Electricity Committee has authorised the carrying out of mains extensions at a cost of £19 670 in one case and £1 575 in another.

Haslingden T.C. has appointed a special committee to deal with future applications in connection with the assisted wiring scheme.

West Lancashire R.D.C. has obtained sanction for the borrowing of £11 508 in connection with the Aughton electricity scheme.

Gloucester City Council has applied for a loan of £7 000 to meet the estimated cost of laying a.c. mains in place of d.c. in a portion of the city.

Hull Electricity Committee is to arrange for a bulk supply to the whiting works of Messrs. Storry, Witty and Co., Ltd., near Beverley, at a cost of £6 370.

The Wessex Electricity Co. is extending its supply from Yarnton to Bicester. The company also proposes to give a supply to Kidlington by next Christmas.

Witham Urban Council has accepted the offer of the East Anglian Electric Supply Co. for public lighting at £7 15s. 6d. per 300 watt lamp, lighted from sunset until 11 p.m.

Ballymena U.D.C. has decided to lodge the necessary documents with the Electricity Commissioners with a view to a Provisional Order being obtained for an electricity scheme.

Glasgow Electricity Committee has authorised mains extensions at a cost of £6 600. The installation in various sub-stations of Reyrolle switchgear, at a cost of £3 000, is approved.

Brighton Electricity Committee is to extend cable at a cost of £1 500 to meet increased demand by the Southern Railway.

Croydon Electricity Committee is to extend mains at a cost of £1 435.

Chatham T.C. has received notice from the Kent Electric Power Co. of its intention to lay cables at Dale End, Dale Street, Rochester Street, Maidstone Road, Cornwallis Road and Wallace Road.

Stone (Staffs) Urban Council has decided to give a supply to Tittensor at an estimated cost of £800, subject to the applicants giving the required guarantee for three years of 20 % of the capital cost.

Formby Urban Council has adopted a free wiring of houses scheme, under which the flat rate will be ½d. per kWh above the rate for ordinary meters. Motors, radiators, kettles, and small cookers are to be let out on hire.

The L.C.C. Highways Committee recommends an expenditure of £47 000 on the provision of three 1 000 kW rotary converters in the sub-stations at Limehouse, Tooting and New Cross, and e.h.t. switchgear at New Cross.

Guildford T.C. has decided to extend the mains to a new estate at Ganghill, London Road, for 25 new houses, on condition that Mr. A. C. Burlingham guarantees a return of not less than £97 for a period of not less than three years.

Eastbourne Electricity Committee has received sanction to borrow £9 496 in connection with the supply to Willingdon and Wannock. The Committee is to lay an 11 000 V feeder to a new sub-station to complete the ring main, at a cost of £13 550.

Two 12 000 kW sets, to supersede two 8 500 kW sets, are to be installed at the Hartshead generating station by the Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board. Districts hitherto untouched are to be provided with a distribution system.

Keswick U.D.C. recently decided to accept the offer of the Society for Safeguarding the Natural Beauties of the Lake District to provide counsel and pay the costs of the inquiry which it is proposed should be held into the question of the erection of overhead cables in the district.

Alterations to the electric lighting at Desford School, at a cost of £350, are to be made by Leicester Education Committee, so that, instead of renewing the battery installation, current can be obtained from the Leicestershire and Warwickshire Power Co. at a fixed annual charge of £75, plus 1½d. per kWh.

The accounts of the Central Electricity Board for the period from March 1st, 1927, to December 31st, 1928, show that the Board's borrowing powers are limited, under the Electricity (Supply) Act, 1926, to £33 500 000, and the amounts for which the Electricity Commissioners have given consent are £5 000 000 for general purposes and £5 000 000 for standardisation of frequency. Capital expenditure amounts to £300 279, in addition to £61 563 advanced to undertakers for carrying out alterations required in the frequency employed. There were outstanding commitments as at December, 1928, in respect of contracts for the construction and acquisition of main transmission lines, amounting to £2 893 000.

ELECTRIC TRACTION.

Electric Vehicles for Refuse Collection—Plant for Glasgow Tramways Power Station.

EAST Ham Corporation is to construct a new tramway route to Becontree.

Blackpool Tramways Committee has given notice to Lytham St. Annes Corporation terminating the present through running agreement over the Blackpool Corporation tramways.

Bradford Electricity Committee has agreed to a scheme for the erection and equipment of a traction sub-station in Norman Lane, Eccleshill, at an estimated cost of £21 580, including mains.

Hackney (London) Works Committee recommends the purchase of seven electric vehicles for refuse collection, at a cost of £4 172. The electricity department has facilities for charging such vehicles.

The General Manager of Reading Corporation Tramways is to submit a report upon the question of extending the tramway service to Tilehurst station and upon the substitution of trackless trolley vehicles for tramcars.

Glasgow Corporation has adopted the recommendation of the Tramway Committee that a new 18 750 kW turbo-alternator be installed at the Pinkston generating station, in replacement of existing plant, at an estimated cost of £218 500.

It is intended to begin the work of enlarging the London County Council tramway tunnel between the Victoria Embankment and Southampton Row in November. The work is to cost £326 500, including £76 400 for the conversion of 50 single-deck cars into double-deckers.

Cardiff Finance Committee has approved a proposal to scrap the single-deck tramcars on the Cathays route, and recommends that the £46 421 involved be met by the transfer of £8 000 from the car renewal fund to the sinking fund, and the redemption of the remaining £39 000 over a period of five years.

Exeter Corporation has received an offer for its tramway system from the Devon General Omnibus Co. The company proposes, should the offer be accepted, to scrap the trams and replace them by motor buses. It is said that the terms of the offer include the paying off of the £36 000 debt remaining on the tramways, the reimbursement to the Council of the money expended on the existing motor-bus system and an annual contribution in consideration of the right to run the city's omnibuses.

TRADE PUBLICATIONS.

MESSRS. S. G. LEACH AND CO., LTD., 26-30, Artillery Lane, E.1, have published list No. N.S. 108 dealing with H.B. drink-mixers.

The WESTINGHOUSE MORSE CHAIN CO., LTD., Letchworth, has issued a special folder relative to "Chainoleum W.M." grease.

A. H. HUNT, LTD., of Croydon, Surrey, have published a new catalogue of accessories and small electrical appliances. The reference number is 61.

BROOKHIRST SWITCHGEAR, LTD., Northgate Works, Chester, has published a postcard indicating the various current publications on "Brookhirst" electric control gear.

The 1929/30 catalogue of the ELECTRIC HEATING CO., George Street, Croydon, has been received, and its size has been increased from 32 to 48 pages. The catalogue includes particulars of 14 new lines.

No. 42 of the Heat Treatment bulletin issued by WILD BARFIELD ELECTRIC FURNACES, LTD., of Elecfurn Works, North Road, London, N.7, contains an article entitled "The Heat Treatment of High Tensile Aluminium Alloys."

ASCOG, LTD., 44, Theobalds Road, London, W.C.1, have sent us copies of list No. 101, dealing with the "Altrax" flashing lamp; list No. 109, describing new fittings for "Altrax Allglass" transparent lighting units of outside type; list No. 110, dealing with similar units for window display and illumination; and list No. 111, giving particulars of "Saturn" electric decorative letters for display purposes. Lists 101, 110 and 111 are coloured.

In a new illustrated brochure on church lighting, the GENERAL ELECTRIC CO., LTD., expresses the hope that it will prove of service to those interested in the lighting of places of worship of all denominations. The aim of this publication is to show how effectively all kinds of structures—either ancient or modern—large or small—can be illuminated on lines that permit of the retention of any required atmosphere, and which, at the same time, will reveal the architectural beauties of these buildings.

COMPANY NEWS.

Big Rise in G.E.C. shares — Companies' Meetings and Reports.

THE feature of the past week in the electrical share markets has been the buying of General Electrics, and the price has advanced 12s. 6d., from 53s. 9d. to 66s. 3d., which compares with under 44s. a month ago. Johnson and Phillips shares during the week have risen from 36s. 3d. to 40s. Marconi's International Marine shares are unchanged on the week, but, at 66s. 3d., are 6s. 3d. higher than when our price list last appeared, three weeks ago. County of London Supply shares, which have been bought during the past week, are 3s. 6d. higher than last week, and 1s. higher than three weeks ago. Hydro-Electric "B" Five per Cent. preference shares are quoted about 9. Siemens Brothers and Co. ordinary shares have risen during the week from 26s. 10½d. to 30s. and Cables and Wireless "B" shares from 76 to 79, while Eastern Telegraph preference and ordinary have dropped 2 and 7 points respectively.

ROYCE, LTD.—Loss for year ended March 31, 1929, was £7 151, increasg. debit blce. to £34 452.

HALESOWEN LIGHTING AND TRACTION CO., LTD.—The Co.'s name has been changed to Shropshire, Worcestershire and Staffordshire Electric Power Development Co., Ltd.

LANCASHIRE ELECTRIC LIGHT AND POWER CO., LTD.—It was announced last Saturday that the sh. certificates in respect of the issue of ord. shs. were ready to be exchanged for letters of allotmt.

WEST INDIA AND PANAMA TELEGRAPH CO., LTD.—Receipts for 1928 amtd. to £58 417 and workg. exes. to £75 243, leavg. debit blce. £16 825. After providg. £4 455 int. on debs. and £3 587 for deprecn. and renewals of s.s. "Henry Holmes," debit. to rev. is £24 868, raisg. debit blce. brt. in to £152 401.

TYNESIDE TRAMWAYS AND TRAMROADS CO.—Report for half year ended June 30 states exes. exceed rcpts. by £534, to which must be added int. on mortgages, etc., less int. on investments, making total deficit for half-year £2 062. Amt. of £2 100 has been transferred from gen. res., and, after bringing in blce. of £30 from previous half-year, £68 remains to be carried fwd.

ORMSKIRK ELECTRIC SUPPLY CO., LTD.—It is announced that the pref. and ord. sh. cap. of the Ormskirk Electric Supply Co. has been purchased by the Lancashire Electric Light and Power Co., Ltd. During the past financial year the Central Electricity Board adopted a scheme for North-West England and North Wales, embracing the whole of the Lancashire Electric Power Co.'s area of supply.

ELECTRIC FURNACE CO., LTD.—It is announced that the company has acquired from the German firm Hirsch Kupfer und Messingwerkegesellschaft the English and French patent rights for the manufacture of electric resistance furnaces, according to the latter firm's process. Under the agreement with the German firm the Electric Furnace Co.'s territory will include, besides England and France, Belgium and the English Crown Colonies.

WILLIAM BEARDMORE AND CO., LTD.—At an extraordinary general meeting on Tuesday, resolutions approving the reorganisation of the loan and share capital were confirmed. Mr. L. C. Ord, who presided, said, as the shareholders were aware, the resolutions as appearing in the notice were amended to provide for an increase in the rate of interest on the 2nd preference shares to be issued to the noteholders and a further alteration of the articles of association precluding the company from issuing any further preference shares ranking in priority to or *pari passu* with the 1st and 2nd preference shares issued pursuant to the scheme.

Company Meetings.

BENN BROTHERS, LTD.—The 33rd annual general meeting of the shareholders of Benn Brothers, Ltd. (the proprietors of THE ELECTRICIAN), was held on August 9th, Sir Ernest Benn, chairman, presiding. The Chairman, in moving the adoption of the report and balance sheet for the year ended June 30th, stated that about £4 000 more was being distributed to shareholders, as the dividend was up to 20%. In that respect he would like to correct an impression which had been created on the part of the vulgar and misinformed public press that a sudden accession of wealth had come to the company. If they had had some wonderful luck or unexpected bit of profit he would be the last man on earth to recommend it for dividend. The increase in the dividend on the ordinary shares was long overdue. For, he thought, about nine years the shareholders had received 17½%, during which period the management had acquired three or four important journals; set on their feet two associated companies, and had built Bouverie House; but the shareholders had not criticised the directors in the last two or three years, and to add 2½% to the dividend was felt to be a safe thing to do. The bank loan in the balance sheet had gone down to £20 000, so that a 20% dividend was but a small step to, it was hoped, a still more adequate dividend in the future. It had been the custom at similar meetings in the past to say something about the state of trade as a whole. The company claimed, as the largest trade and technical paper publishers outside America, to know something about the real state of trade in this country; and as a result of that very intimate touch which their trade papers had with literally hundreds of thousands of business men, the company knew more about the conditions of trade and industry than politicians who had so much help and said so much about it from time to time. The present-day British business man was a very marvellous creature; he not only provided a thousand million a year in rates and taxes, but he accomplished this astounding feat in face of unprecedented difficulties. He had to work inside a ring fence of bureaucratic trade union and other officials of various kinds, whose aim and object it was to see that his standards, whether in buildings, equipment, output, or in any other way, were carefully kept down to the mediocre level of the mass. He had somehow to rise above the pessimistic atmosphere created by the politicians. He succeeded in spite of a weight of political discouragement and despair. The British business man to-day not only delivered the goods, but employed more people at better real wages than ever before in our history. He (Sir Ernest) knew of no higher achievement in the story of human endeavour, and pleaded for a reversal of our attitude towards our daily work and our business triumphs. While we must avoid anything in the nature of American boost, the time had arrived for a properly modest recognition of the wonderful way the business classes were handling a situation still full of enormous difficulties. The skill, wisdom, energy and enterprise of the modern business man had never been approached by any other class or any other nation at any other time. Returning to the sphere of Bouverie House, the company's policy was one of optimism and cheerful encouragement, for it took pride in the fact that British trade was really doing better. The company, he remarked, had a greater heart than that of mere money making. During the year he (Sir Ernest) had been President of the National Advertising Benevolent Society; Mr. Gordon Robbins was Chairman of the Council of the Newspaper Press Fund; Mr. E. E. Starke was the life and soul of the Royal Metal Trades' Pension and Benevolent Society, being on the Board of Management; while Mr. Crole-Rees was a member of the Executive Council of the Furnishing Trades' Benevolent Association. Some of their 14 editors likewise played an important part in public affairs. The report and balance sheet were adopted, and the following dividends were approved: 3% on the preference shares, making 6% for the year; 13¾% on the ordinary shares, making 20% for the year; and 2s. 9d. per share on the deferred shares, making 4s. for the year.

DOMINION TRACTION AND LIGHTING CO., LTD.—A mtg. of holders of the 1st mtge. 35-year gold bonds will be held at Cannon Street Hotel, London, E.C.4, on Sept. 2 to consider resolutns. to sanctn. the release of $750 000 of bonds, with all unpaid coupons of the Windsor, Essex and Lake Shore Rapid Railway Co., in exchange for an assignment of the whole consideratn. which may be payable to the Railway Co. by the Windsor, Essex and Lake Shore Railway Association for the assets of the Railway Co. and for incidental purposes. Forms of proxy can be obtained from Messrs. Price, Waterhouse and Co., 3, Frederick's Place, Old Jewry, London, E.C.2.

METAL AND CHEMICAL PRICES.

TUESDAY, August 13th.

	Price.	Inc.	Dec.
Copper—

Sulphur—Flowers, Ton £12 0 0 *Copper Sulphate*—Ton £25 to £25 10 0
„ Roll, „ £10 10 0 *Boric Acid* (Crystals) „ £30 0 0
Sulphuric Acid (Pyrites, 168°) Ton £6 15 0 *Sodium Chlorate*—Per lb. 2½d.
Sodium Bichromate—Per lb. 3½d.
Rubber—Para fine, 11½d.; plantation, 1st latex, 10¾d.

∴ The metal prices are supplied by British Insulated Cables Ltd., and the rubber prices by W. T Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

The market maintained a very firm tone last week, according to James Forster and Co., until all metals were upset by the raising of the Bank Rate in New York. Copper fell 10s., tin £2, spelter 7s. 6d., and lead 5s. per ton. Closing prices on August 9th were £23 2s. 6d., for August and September and £23 1s. 3d. for October and November, 3s. 9d. per ton down on the week.

NEW COMPANIES.

LONDON STEEL WORKS, LTD.—Cap., £100. Mechanical and electrical engineers, etc. Reg. Office: Wellington Street, Slough.

TEXA ELECTRICAL CO., LTD.—Cap., £1 000. To carry on the business of electricians, electrical and mechanical engineers, etc. Reg. office: Chandos House, Buckingham Gate, S.W.

G. M. PATERSON AND LOGAN, LTD.—Cap., £600. To carry on the business of distributors of all kinds of wireless and electrical goods. Reg. office: 122, West Campbell Street, Glasgow, C.2.

ELECTRAFONT, LTD.—Cap., £100. Electric water heater manufacturers, electrical engineers, etc. Solicitors: Jennings, Son and Ash, 69, Leadenhall Street, London, E.C.3.

COVENTRY MACHINE TOOL WORKS, LTD.—Cap. £20 000. To carry on the business of mechanical, electrical and general engineers and manufacturers. Reg. office: St. George's Road, Coventry, Warwickshire.

ELLISON INSULATIONS, LTD.—Cap., £15 000. Manufacturers and producers of or dealers in electrical and thermal insulating materials, organic and inorganic plastic materials or mixtures, etc. Reg. Office: Wellhead Lane, Perry Barr, Birmingham.

A. H. ALLEN AND CO. (ENGINEERS), LTD.—Cap., £4 000. To acquire business of engineer, etc., carried on by A. H. Allen at Northampton, and to carry on same and business of electricians, etc. Reg. Office: 38, St. Andrew's Street, Northampton.

WOOD FITTINGS AND STANDARDS, LTD.—Cap., £5 000. To acquire business of manufacturers of electric light fittings carried on at 66, Charlotte Street, and 3, Bedford Passage, Charlotte Street, London, W., under the respective titles of Wood Fittings Co. and Wood Standards Co.

BRITISH AUTOMATIC TRAIN CONTROL SYSTEM, LTD.—Cap., £5 000. To obtain and undertake contract for power and automatic signalling to carry on the business of railway signal and interlocking apparatus makers and contractors, etc. Solicitors: Elwell and Binford Hole, 65, Coleman Street, London, E.C.2.

SHOCK PROOF CO., LTD.—Cap., £2 000. To acquire from R. Lomax the benefit of certain existing inventions in relation to the production of electric service boxes, to carry on business as manufacturers of and dealers in lampholders, etc. Solicitor: A. E. Grundy, 2, John Dalton Street, Manchester.

LUSTRE ELECTRIC LAMPS, LTD.—Cap., £600. Manufacturers of and dealers in wireless, telegraphic and telephonic apparatus, electric lamps and holders for same, manufacture of glass and moulders of the same into bulbs, tubing, rods or other designs, etc. Reg. Office: Walter House, 418-422, Strand, London, W.C.

DUNHAMS, LTD.—Cap., £15 000. To acquire business of wireless manufacturer carried on by C. S. Dunham, at Elm Works, Elm Park, Brixton Hill, London, S.W.2, and to carry on business of manufacturers of or dealers in wireless, radio or gramophone apparatus, etc. Reg. Office: Elm Works, Elm Park, Brixton, London, S.W.2.

ROZALEX, LTD.—Cap., £100. To adopt an agreement with the Chloride Electrical Storage Co., Ltd., for the acquisition (inter alia) of the registered trade mark "Rozalex," and to carry on so much of the business carried on by the Chloride Electrical Storage Co., Ltd., as is comprised in the said agreement. Reg. office: 26, Cooper Street, Manchester.

STEWART AND MCDONNELL, LTD.—Cap., £200 000. To acquire business formerly carried on by Stewart and McDonnell at 52, Coleman Street, E.C., constructors of public and other works, including electric light, telephonic, telegraphic and power supply works, etc. Solicitors: Messrs. Slaughter and May, 18, Austin Friars, E.C., and Tamplin, Joseph, Ponsonby and Ryde, 165, Fenchurch Street, E.C.

VOCAFILMS, LTD.—Cap., £10 000. To adopt an agreement with R. Yorke and N. Sharples, to acquire any patents relating to manufacture of combined television and sound producing instrument for transmission of pictorial representations simultaneously with oral expressions and the making of a film and sound record at or about the time of such transmission, etc. Qualification: £1. Solicitors: Woosnam and Callis, Blackpool.

THE UNITED DOMINIONS TRUST (ELECTRIC), LTD.—Cap., £250 000. To carry on the business of banking in all its branches, and to grant special facilities to municipalities, municipal supply companies, private supply companies, electrical contractors, undertakers and manufacturers covering the sale, hire, hire purchase or any other method of disposing of all kinds of electrical equipment, etc. Solicitors: Simmons and Simmons, 1, Threadneedle Street, E.C.2.

BRITISH ITALIAN POWER AND IRRIGATION TRUST, LTD.—Cap., £75 000. To adopt agreement with French, British and Foreign Trust, Ltd., to enter into or acquire and carry out contracts, concessions or grants in any part of the world for the construction, repair, maintenance, operation or control of electric, hydraulic and other works, electric or other lighting, railways, tramways, etc. Reg. Office: Dashwood House, 69, Old Broad Street, London, E.C.2. (Public Co.)

SIR W. G. ARMSTRONG WHITWORTH AND CO. (ENGINEERS), LTD.—Cap., £1 500 000. To acquire businesses of general engineers now carried on by Sir W. G. Armstrong Whitworth and Co., Ltd. (whose name is about to be changed to the Armstrong Whitworth Securities Co., Ltd.) at Scotswood Works, Scotswood, and Close Works, Gateshead, and to carry on the business of engineers, boiler makers, manufacturers of and dealers in railway carriages, tramcars, railway and tramway plant, etc., electricians, electrical engineers, constructors of railways, tramways, etc.

COMMERCIAL INFORMATION

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BERRY, Robert, Coventry House, 15, Denbigh Street, Llanrwst, wireless dealer. £12 2s. 8d. June 27th.

EXHIBITION FITTERS, LTD., 11/12, Portsea Mews, Portsea Place, Connaught Street, W., electrical engineers. £17 15s. 3d. July 11th; £16 4s. 4d. July 8th.

FENNEMARE, William, Market Square, Sandy, wireless agent. £19 17s. 2d. July 2nd.

FLEET ELECTRIC SERVICE, 6/8, Ivy Lane, E.C., electrical engineers. £12 6s. 1d. June 27th.

HOLBROOK AND TATTERSALL, LTD., 6, Cheapside, E.C., electrical engineers. £21 10s. 11d. July 11th.

HURST, Mr. T. R., 1, Glasshouse Lane, Mexborough, electrical engineer. £18 9s. 9d. June 21st.

NANKIVELL, Mr. T. E. (trading as STEWART AND CO.), 95, Sutton Road, Southend, electrical engineer. £29 14s. 9d. June 26th.

OFFER (JAMES R.) AND SONS, LTD., 8, Church Street, Kingston-on-Thames, wireless dealers. £21 10s. 10d. June 7th.

RADIO HOUSE, 510, Stockport Road, Longsight, wireless dealers. £19 17s. June 11th.

SANDS, Mr. C. W., High Street, Kings Langley, electrical engineer. £14 18s. 1d. June 17th.

SOUTH ESSEX ELECTRICAL CO., 30, London Road, Romford, electrical engineers. £64 8s. 8d. July 8th.

SUMMERS, E., Parade, Perranporth, electrical engineer. £10 17s. 2d. July 3rd.

Bill of Sale.

WALKER, Herbert Faulkner, 41, Dorothy Road, Lavender Hill, S.W., wireless, gramophone and electrical goods dealer. Dated August 1st, filed August 7th, £50.

Deeds of Arrangement.

FRANCE, Clarence, trading as RADIO EQUIPMENTS, 180, King Cross Road, Halifax, wireless engineer. Dated August 6th, filed August 9th. Trustee, A. N. Buckley, 45 and 47, Commercial Street, Halifax, I.A. Liabilities unsecured, £566; less secured claims, £268.

WAKELING, Arthur Beverley, 558, Beverley Road, Hull, electrical engineer. Dated August 7th, filed August 8th. Trustee, W. B. Hall, Silver Street, Hull, C.A. Liabilities unsecured, £347; assets, less secured claims, £125.

London Gazette, etc.

Bankruptcy Information.

WHITTLE, Frank, 41, Mawdsley Street, Bolton, Lancs, electrician. First meeting, August 16, 10.45 a.m., Bolton, and public examination, September 17th, 10.45 a.m., the Court House, Mawdsley Street, Bolton.

Partnerships Dissolved.

BROWN AND JESSIMAN (George BROWN and Alexander Hogg JESSIMAN), makers of electrical fittings, etc., at 4, Newton Terrace Lane, Glasgow, as at May 28th, 1929, by mutual consent. G. Brown will carry on business on his own account and in his own name at the same address. A. H. Jessiman will carry on business on his own account and under the style of A. H. JESSIMAN AND CO., at 11 Berkeley Terrace, Glasgow.

VECTOR ELECTRICAL COMPANY (Ernest Edwin WALKER, Annie WALKER and John WESTBY, electrical engineers, 40, Broadfield Road, Sheffield, by mutual consent as from July 31st, 1929. Debts received and paid by E. E. Walker, who will continue the business.

Notices of Dividends.

DAWSON, Joseph Edward, High Street, Boston, wireless engineer. First and final dividend, 4s. 0½d. per £, payable, August 26th, Office of Trustee, 5, Church Close, Boston, Lincs.

MARSDEN, Charles Bertie, 60, Pisgah Street, Kenfig Hill, Glamorgan. First and final dividend, 5s. 10d. per £, payable August 21st, Official Receiver's Office, 34, Park Place, Cardiff.

SEWELL, Sidney James, BROWN, William Lewis, carrying on business in co-partnership as SEWELL AND BROWN, at 6A, The Exchange, Muswell Hill, electrical and radio engineers. First and final dividend, 2s. per £, payable any day (except Saturday), between the hours of 11 and 2, Bankruptcy Buildings, Carey Street, London, W.C.2.

Application for Discharge.

HILTON, Reginald, 81, Blackburn Street, Radcliffe, electrical engineer. Hearing, September 11th, 10 a.m., Court House, Mawdsley Street, Bolton.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

313 063 W. S. Smith and N. W. McLachlan. Thermionic and like amplifying systems. (1/3/28.)
312 962 W. S. Smith and N. W. McLachlan. Electro-acoustic transmission and the like systems. (1/3/28.)
313 193 Y. Noishiki. Induction-cufrent generating apparatus for medical treatment. (1/3/28.)
290 653 Siemens and Halske Akt.-Ges. Apparatus for indicating electrically the position of adjustable units. (20/5/27.) (Addition to 280 562.)
313 025 General Electric Co., Ltd. and R. J. Kaula. Containers of moulded or cast material. (2/3/28.)
312 971 J. Allen. Electric discharge tubes. (3/3/28.)
312 974 A. G. Kershaw, R. S. Griffiths and Westinghouse Brake and Saxby Signal Co., Ltd. Railway signalling and the like apparatus. (3/3/28.)
286 318 Quarzlampen-Ges. Quartz lamps. (4/3/27.)
313 030 Igranic Electric Co., Ltd. (Cutler Hammer Manufacturing Co.). Electrical power distribution systems. (5/3/28.)
286 628 Allgemeine Elektricitats-Ges. Automatic prepayment-meter for electricity, gas, water, and the like. (5/3/27.)
313 069 A. G. Westmoreland. Adjustable brackets or supports for telephones. (6/3/28.)
313 107 A. G. Westmoreland. Adjustable brackets or supports for telephones. (6/3/28.)
313 111 E. Green. Circuit arrangements for use with high-frequency currents. (7/3/28.)
313 113 Automatic Telephone Manufacturing Co., Ltd. and C. E. Beale. Telephone systems. (7/3/28.)
286 659 Associated Telephone and Telegraph Co. Telephone systems. (7/3/27.)
313 200 Siemens Bros. and Co., Ltd., W. G. Patterson and J. E. Tees. Telephone systems. (8/3/28.)
313 208 W. Phillips and Elliott Bros. (London), Ltd. Electrical indicating and/or recording apparatus. (9/3/28.)
313 211 R. Brooks and Associated Electrical Industries, Ltd. Electric relays applicable more especially in electric motor control systems. (9/3/28.)
286 733 Engineering Products Corporation, Inc. Insulation of high-tension cables and high-tension cable joints. (11/3/27.)
298 461 Siemens and Halske Akt.-Ges. Process and an apparatus for carrying out the oxidation or reduction of electrolytes. (8/10/27.)
313 223 British Thomson-Houston Co., Ltd., F. H. Harris, L. R. Nixon and J. V. Peacock. Control systems for dynamo-electric machines. (16/3/28.)
313 224 H. Baron (Electroacustic Ges.). Electrically-operated sound transmitters. (17/3/28.)
287 467 British Thomson-Houston Co., Ltd. Electric heaters. (19/3/27.)
313 227 R. Brooks and Associated Electrical Industries, Ltd. Electrica l circuit-breakers. (19/3/28.)
313 229 S. G. S. Dicker. (N.V. Philips' Gloeilampenfabrieken). Amplification of electrical oscillations. (20/3/28.)
313 230 General Electric Co., Ltd. and W. Wilson. Thermostatically-controlled electric switches. (20/3/28.)
313 247 J. E. Pollak (Hermsdorf-Schomburg-Isolatoren Ges.). Circuit arrangement and apparatus for measuring high voltages. (3/4/28.)
313 248 Chloride Electrical Storage Co., Ltd. and R. E. Sanderson. Electric lighting, heating, or power systems. (4/4/28.)
313 256 C. Holt and Economic Electric, Ltd. Method of control for wireless reception apparatus. (12/4/28.)
313 267 G. A. Juhlin, R. Townend and Associated Electrical Industries, Ltd. Brush-holders for dynamo-electric machines. (30/4/28.)
313 268 English Electric Co., Ltd. and F. Morris. Controlling-gear for electrically-propelled vehicles. (2/5/28.)
289 818 Marconi's Wireless Telegraph Co., Ltd. Automatic speed-control mechanisms and the like. (2/5/27.)
291 026 Siemens and Halske Akt.-Ges. Electric rectifiers. (24/5/27.)
313 282 Radio and Electric Services, Ltd. and B. Groom. Loud speakers. (14/5/28.)
313 289 R. Edmondson and Associated Electrical Industries, Ltd. Commutators for dynamo-electric machines. (19/5/28.)
313 292 P. Freedman. Metallic vapour lamps and gaseous discharge devices. (23/5/28.)
313 297 H. A. H. Nijland. Electric contacting devices for accomplishing a temporary connection, for making measurements to, or for short-circuiting or earthing conductors. (29/5/28.)
312 141 Langendorf Watch Co. Electric contact pin or plug. (21/5/28.)
313 318 E. Y. Robinson and Associated Electrical Industries, Ltd. Vacuum electric-tube devices. (19/9/28.)
313 319 H. Crowther. Switches for overhead runways. (20/6/28.)
293 747 Siemens and Halske Akt.-Ges. Circuit arrangement for the transmission of messages over telephone lines. (11/7/27.)
292 521 Akt.-Ges. Brown, Boveri et Cie. Quick-acting regulator of the vibrating type for keeping the current or voltage of generators constant. (20/6/27.)
295 374 Siemens and Halske Akt.-Ges. Telephone switching cabinets. (12/8/27.)
313 323 Coventry Automatic Telephones, Ltd. and H. G. Menage. Impulse-senders for automatic telephone systems. (23/6/28.)
313 329 Walker, Hunter and Co., Ltd. and J. Walker. Electric irons. (2/7/28.)
313 342 General Electric Co., Ltd. and W. M. Cranston. Brush holders for dynamo-electric machines. (9/7/28.)
304 584 C. Lorenz, Akt.-Ges. Microphones. (21/1/28.)
313 356 G. H. Ide and H. L. Bentley. Electric switches. (27/7/28.)
299 716 International General Electric Co., Inc. Electric conductors. (29/10/27.)
299 884 Telefunken Ges. Fur Drahtlose Telegraphie. Light-control devices suitable for use in recording sounds or in picture telegraphy and for like purposes. (3/11/27.)
299 893 International General Electric Co., Inc. Switches for use with transformers. (3/11/27.)

Applications for Patents.

May 15th.

15 180 W. E. Fischer. Devices for switching on lamps at predetermined times.
15 186 Landis and Gyr Soc. Anon. Self starting synchronous motor. (16/6/28, Switzerland.)
15 156 R. Lomax and A. Mugeli. Bayonet lampholders.
15 244 Oldham and Son, Ltd., and W. D. Wilde. Galvanic batteries.
15 181 F. Renyard. Cable connecting sleeve.
15 159 Western Electric Co., Ltd. (Bell Telephone Laboratories, Inc.) Electrodynamic devices.

May 16th.

15 359 Allmanna Svenska Elektriska Aktiebolaget. Current carrying coils. (16/7/28, Sweden.)
15 375 Associated Electrical Industries, Ltd. Dynamo electric machines. (17/5/28, U.S.)
15 376 Associated Electrical Industries, Ltd., and E. Y. Robinson. Vacuum electric tube devices.
15 361 Automatic Telephone Manufacturing Co., Ltd., R. Haworth, and S. R. Smith. Electromagnetic counting devices.
15 262 S. F. Bickell, F. H. Reeves, and Revo Electric Co., Ltd. Plug and socket connections.
15 263 S. F. Bickell, F. H. Reeves, and Revo Electric Co., Ltd. Electric boiling plates, etc.
15 287 S. Brierley. Detector heald for electric warp-stop motions.
15 377 British Thomson-Houston Co., Ltd. Motor control systems. (16/5/28, U.S.)
15 265 S. O. Cowper-Coles. Making copper wire.
15 349 Dubilier Condenser Co. (1925), Ltd. Electrical condensers. (16/5/28, U.S.)
15 329 Electrolux, Ltd. Refrigerating apparatus. (25/5/28, Germany.)
15 315 E. N. Elford, Graham-Amplion, Ltd., and C. F. Phillips. Controlling means for power amplifying apparatus.
15 317 E. N. Elford and Graham-Amplion, Ltd. Electrical means for control of monitoring, etc., telephone apparatus.
15 308 Elin Akt. Ges. fur Elektrische Industrie. Device for switching over windings in dynamos. (25/5/28, Austria.)
15 371 H. Fekkes. Electric lamps. (11/6/28, Belgium.)
15 401 Felten and Guilleaume Fabrik Elektrische Kabel, Stahl and Kupferwerke Akt.-Ges. Stranded electric cables. (19/4/29, Austria.)
15 335 E. W. B. Gill. Electrolytic treatment of gas.
15 316 Graham Amplion, Ltd., and C. F. Phillips. Controlling means for power amplifying apparatus.
15 318 Graham Amplion, Ltd. Amplifying apparatus.
15 374 H. Guillou. Quartz insulating mounting. (24/5/28, Luxembourg.)
15 363 L. Mellersh-Jackson (Siemens and Halske A.-G.). Electrolytic production or separation of tin.
15 302 A. G. Sant. Leads or connections for electrical instruments.
15 303 D. N. Sharma. Television, etc., systems.

May 17th.

15 436, 15 437 Appareillage Gardy Soc. Anon. V. Kunz. Cut-out devices.
15 508 Associated Electrical Industries, Ltd. Dynamo-electric machines. (17/5/28, U.S.)
15 510 Associated Electrical Industries, Ltd. Motor speed regulation systems. (19/5/28, U.S.)
15 523 H. H. Berry and C. A. Painton. Thermostatic control of electrical apparatus.
15 488 British Thomson-Houston Co., Ltd. Signalling systems. (17/5/28, U.S.)
15 489 British Thomson-Houston Co., Ltd. Electric switches. (17/5/28, U.S.)
15 490 British Thomson-Houston Co., Ltd. Oil filled, lead covered cables. (18/5/28, U.S.)
15 493 British Thomson-Houston Co., Ltd. Electric circuit controlling systems. (19/5/28, U.S.)
15 494 British Thomson-Houston Co., Ltd. Circuit interrupting systems. (19/5/28, U.S.)
15 495 British Thomson-Houston Co., Ltd., and F. H. Harris. Generator control systems.
15 487 R. Crittall and Co., Ltd., and J. L. Musgrave. Magnetically operated valves.
15 481 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). X-ray tubes.
15 520 Electrical Research Products, Inc. Zero wander correcting circuits for cable signalling. (19/7/28, U.S.)
15 517 Electroacustic Ges. Acoustic direction determining device. (8/9/28, Germany.)
15 527 General Electric Co., Ltd. Electric lamps. (23/5/28, Germany.)
15 476 Graham Amplion, Ltd., A. D. Hodgson, and J. S. Murray. Electrical oscillation generator.
15 478 R. M. Hamilton. Electrical indicators, relays, etc.
15 483 R. M. Hamilton. Totalisators.
15 442 J. W. Howard and Lancashire Dynamo and Motor Co., Ltd. Dynamo-electric machinery.
15 448 R. Lomax and A. Mugeli. Switch lampholders for electric lamps.
15 552 M. E. MacGregor. Electrolytic cells.
15 544 L. M. Myers and Universal and General Radio Co., Ltd. Television apparatus.
15 505 N. Porter and Watson-Norie, Ltd. Electric heating apparatus for liquids.
15 450 Siemens-Schuckertwerke A.-G. Signalling cables. (23/5/28, Germany.)
15 463 W. H. Storey. Telephones.
15 558 R. Viesi. Apparatus for simultaneous control of wireless oscillatory circuits, etc.

May 18th.

15 577 C. Andrews and F. Chambers. Electric switches.
15 639 T. A. Biddington and R. Field. Wireless receiving apparatus.
15 636 H. F. Biggs. Electric terminals.
15 589 L. P. Laker. Radio receiving, etc., apparatus.

Trouble in Lakeland.

ONCE again the public Press is agog with indignation over the Central Electricity Board's proposed overhead transmission line through parts of the Lake District, which, to judge from some of the letters that have been printed in the papers, is about to be completely and irreparably disfigured unless something is done to scotch the advance of the desecrators. Our views on the matter have so often been expressed that it is hardly necessary for us to point out at this stage that no public utility service can afford to flout public opinion, especially in matters concerning the amenities of a district. At first glance it seems hard that a beneficent engineering service should be held up at the whim of objectors, many of whom have not even a rudimentary idea either of the actual appearance of the structures which arouse their ire, or of the consequences which would follow a successful accomplishment of their reactionary efforts. But if there is unjust bias it must be admitted that the fault is largely ours; not in proceeding with schemes of definite and far-reaching public advantage but in failing to overcome the obstructionist objections by educational means. The public—and especially that section of it which is concerned in preventing the imagined spoliation of the beauties of Lakeland—needs something more than the mere assurance that an eminent Academician is keeping an eye on the æsthetic aspects of the matter. They need to be met half—and more than—halfway with facts and photographs, and even specimen stretches of overhead line, and when, as a result, they understand what the electrical invasion really implies, protests of the kind which have been so frequent of late will disappear. One has only to look at the terminology which has grown up in the anti-overhead line camp to see how ill-informed is most of the criticism that has been put forward. We read, for instance, of "rows of Eiffel Towers," "towering pylons" and such-like descriptive extravagances, and we wonder at the criticism that is aroused. If the schemes involved the erection of replicas of the unsightly Parisian landmark, or of "low towers having a truncated pyramidal form, and flanking an ancient Egyptian gateway" (our dictionary's definition of a pylon) the critics would be justified, and we would be the first to agree with them. As it is, the structures which it is proposed to erect are, at close quarters, far from unpleasing to the eye, and when viewed from a distance blend uncommonly well with the surrounding scenery. They are of incomparably better appearance than any of the overhead line supports we have ever seen abroad. They compare still more favourably with the communication lines of the Post Office, which, however useful, are definitely disfiguring, but are nevertheless tolerated, almost unnoticed, in many of our beauty spots, and along many hundreds of miles of our rural roads. In view of the wide publicity which has been secured by the opposition in the Keswick case, the Minister of Transport will be well advised to grant to the Keswick Council the public inquiry they ask for. It would provide an excellent starting-point for the introduction of a few of the educational features referred to above.

Hydro-Electric or Steam?

THE dependence of hydro-electric plants upon steam stations for the maintenance of regular and uninterrupted service during the ordinary course of Nature's vagaries is emphasised in an American report showing that the production of electricity by water power during June was only 40 per cent. of the total produced in the U.S.A., as compared with 43 per cent. in May, and 44 per cent. in June of the previous year. The decline due to the drought looks small expressed in percentages, but its extent is better appreciated from looking at the analyses of the various sections of the country. In Massachusetts, for example, the output of hydro-electric power decreased from 70 648 000 kWh in May to 46 896 000 in June, a drop of one-third. This deficiency was offset by an increased output from the steam plants of the interconnected systems, those of Rhode Island in particular rising from 30 776 000 to 46 990 000 kWh, or by more than 50 per cent. A similar situation took place at Conowingo, on the Susquehanna. Here the output of water power in Maryland decreased from 179 176 000 kWh in May, to 97 141 000 in June—a drop of almost one-half. On the other hand, the steam power production in Pennsylvania increased from 492 004 000 to 575 027 000 kWh, thus largely compensating for the deficiency of water-power in the interconnected lines. For the first six months of 1929 the average amount of electricity generated by water power in the U.S.A. was 38⅛ % of the total, compared with 41 % for the corresponding period last year, and 39½ % for the whole of 1928. In England the small percentage of hydro-electric to steam

Digitized by Google

stations makes this matter of little more than academic interest. But the big hydro-electric enterprises abroad in which British electrical engineers are interested, such as the great new £4 000 000 water-power project on the Perak River in Malaya, bring the matter into the practical arena.

The New I.E.E. President.

In electing the distinguished engineer-in-chief of the General Post Office as its President for the year 1929–30, the Institution of Electrical Engineers has effectively emphasised its approval of the knighthood recently conferred upon Col. Sir T. F. Purves. The choice is also of interest as indicating a continuance of the policy of drawing succeeding Presidents from different fields of electrical work, thus putting the leadership of the Institution on as wide and representative a basis as possible. Last year the Institution made the uncommon choice of what Lt. Col. K. Edgcumbe himself delights to call "a mere manufacturer," and well has its prescience been rewarded. While the selection of an engineer who has distinguished himself in the realm of electrical communication is not so rare an event, it is seven years since this important side last found direct representation in Mr. Frank Gill. At a time when so many of us are engrossed in the problems of the heavy side of the industry, this appointment serves to remind us that the problems and progress of what used to be called "weak current engineering" are every bit as fascinating and important.

Double-Edged Reparations.

We are not concerned with the political issues involved in the reparations problem which has been so publicly discussed at the Hague, but one aspect of it is, if correctly reported, of distinct interest to the British electrical industry. As part of its reparations in kind to France, Germany has been instructed to erect a great cinema film producing centre, designed to rival Hollywood, on a site between Marseilles and Nice. This work, which will probably cost some thirty million gold marks, will include the provision by German electrical firms of the very extensive electrical equipment needed for studios equipped for the production of sound films. This not only gives Germany a splendid opportunity to demonstrate the efficiency of her studio electrical equipment and practically ensures a continuity of orders—*not* on reparations account—for repairs, replacements and enlargements of the plant, but also deprives British manufacturers of the chance of meeting French requirements in this field, either now or in the future. Other examples of this double-edged competition in the electrical field are not difficult to find, and the irony of the situation only increases with appreciation of the fact that these reparations deliveries are getting German goods into markets which, in the past, have received the bulk of their import requirements from Britain.

Municipalities and Power Companies.

In making comparisons between electricity supply in this country and in the U.S.A. we tend to overlook the fact that the conditions vary in many respects. Here, municipally-owned power stations are in a decided majority, and very rarely do we hear of a municipality selling its undertaking to a company. In the States, however, there are, according to the N.E.L.A., actual records of 1 440 towns with a total population of 2 999 615, where municipal operation has disappeared in favour of company undertakings. It is also stated that a further 498 municipal systems, serving a total population of 1 603 864, which at one time operated their own plants have now sold or scrapped their generating plant, and are now buying bulk supplies from companies.

Marine Speeds.

The intense public interest shown in the recent performances of the "Bremen" and the "Mauretania" in further reducing the time necessary for crossing the Atlantic suggests that the big electric liners now building here will, when completed, command a sufficiently widespread interest to afford a great stimulus to the development of electricity for propulsive as well as auxiliary purposes. Whether we can look to one of these electrically propelled ships to establish a new time record for the crossing remains to be seen, especially as the White Star Line, whose 60 000 ton electric liner is now building at Belfast, has in the past aimed at comfort for passengers rather than high speed. It is more than likely, however, that an electrically propelled vessel will surpass the feat of the German liner.

London's Telephone Jubilee.

Exactly fifty years ago, the first telephone exchange in London was opened by the Telephone Co., Ltd. It was established with about half-a-dozen subscribers, and was housed at 36, Coleman Street, the first authentic home of the public telephone service in London. To-day, the number of London subscribers is nearly 650 000, and the total number of subscribers in Great Britain was, on May 31st last, 1 775 879. Several private lines were already in existence in 1879, one of the first being installed at Chislehurst. The switchboard used at Coleman Street was of what was known as the "Williams'" type. It consisted of an upright connecting board with two separate tables in front for the operators. The venture soon attained popularity, and before the end of the year two further exchanges, one at Leadenhall House, and the other at Palace Chambers, Westminster, were opened. In the following January there were some 200 subscribers to the Company's system. Actually, the honour of possessing the first telephone exchange opened in Great Britain—though not strictly a public one—goes to Scotland. The "Glasgow Medical Telephone Exchange" confined, as the name implies, to doctors, chemists, hospitals and similar interests, was opened in March of the same year. It was quickly followed, in Glasgow, by "Legal," "Stockbrokers," and "Commercial" Exchanges, at the outset independent of each other, though ultimately means were afforded for intercommunication between the four groups. Manchester, Liverpool and Edinburgh all opened telephone exchanges in October, 1879, and Birmingham followed in December of the same year.

Rural Automatic Telephones.

A feature which is likely to encourage electrical development in the rural areas is the extension of the telephone service, which is now going ahead satisfactorily since the introduction of the special type of automatic telephone designed to meet the needs of rural districts. Already this year fifty automatic rural exchanges have been put into operation, and a further hundred have been authorised and will shortly be opened. The smaller maintenance costs of the automatic exchanges make it economic to serve areas which would have been unremunerative with the old manual exchanges, and, as in these comparatively sparsely-populated areas the whole district is given the automatic system at the same time, the difficulties arising out of a simultaneous working of the old and the new systems are avoided.

The Electrical Apple Cart.

There have been strong and persistent rumours current this week that Sir Austen Chamberlain and Sir Laming Worthington-Evans have been invited by Lord Birkenhead to join the board of the Greater London and Counties Trust, of which he is chairman. At present we are unable either to confirm or to deny the report, but if it is true, one of the forecasts in Mr. Bernard Shaw's latest play—that in the near future politics will be left to those who are not clever enough for anything else—will be practically realised. Whether or not it is, as a general rule, good for the electrical apple cart to have its load increased by the addition of ex-politicians and ex-Cabinet Ministers is a question which Mr. Shaw, with his Power-mistress-General, does not answer. Perhaps he thinks that time alone will decide this point.

OVERHEAD LINE PROBLEMS.

Factors Affecting the Painting of Transmission Line Steelwork—Influence of Flexibility of Supports on Mechanical Strength of Lines.

By THEODORE RICH, A.M.I.E.E.

CONTINUING my selection of overhead line constructional, maintenance, and operating problems discussed at the recent Paris Conference on Large Electric Systems, attention may be drawn to a report on the painting of transmission line steelwork which was presented by Mr. Orsero. In this report the author develops a formula by which if P is the price of paint per kg., C its covering power in square metres per kg., N the number of years of protection that can be expected, and T the cost of painting per square metre, then the cost per square metre will be

$$E=\frac{P}{C\times N}+\frac{I}{N}=\frac{I}{N}\left(\frac{P}{C}+T\right)$$

As C and N are denominators, the ideal paint will be the one that will last the longest with the thinnest coating. These factors are contradictory, and the best paint to use seems to be a type which will last twelve years; very thick paint will cost more to put on, as it tires the painters.

Consideration of the formula shows that long life for the paint is a much more important factor than price per kg. In practice, with three coatings on new ironwork, or two coats on well-cleaned old paint, a life of twelve years can be anticipated.

Rust develops on ironwork when in contact with moist air, and once begun, it continues, even when the iron is kept away from air. It is, therefore, most important for ironwork to be well cleaned before being painted. New ironwork is usually painted at the factory with iron oxide or red lead paint. Oil of good quality is not always used, and difficulty sometimes ensues after final painting, owing to such priming coats coming away.

Electrically-prepared lead gives paint a greater covering power than that of normal lead paint to the extent of 7 to 4. Crystallised iron oxide paints made of a very fine volcanic spangly ore are good rust resisters. Their composition is 90 to 92% Fe_2O_3, their covering power is 10 to 12 sq. metres per kg., and their colour is dark grey; they are being much used in France. Bituminous products often contain free acids; they are acted on by the sun, they are dirty to use, their price is low, but their life is short, and their black colour is not decorative, and it cannot be covered with light paint.

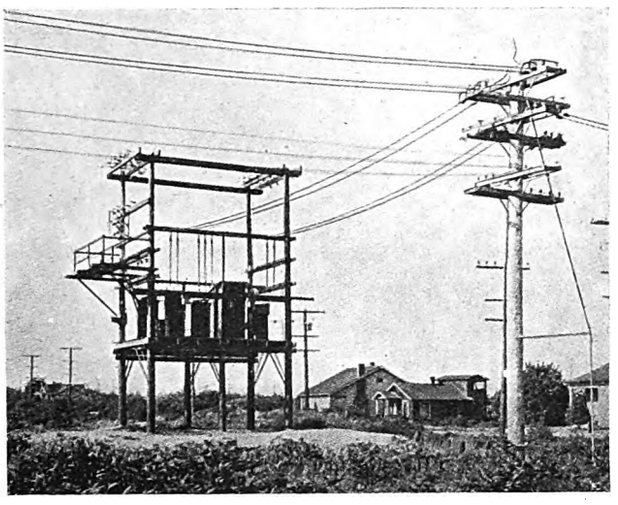
When arranging a specification for a contract for paint work, duration guarantees should be asked for; repainting should not usually be necessary before three years for one coat, six years for two, and ten years for three. Tests for covering power should be made on clean smooth iron sheets, each of at least 1 sq. metre surface; the brush and paint can should be weighed before and after use.

A 120 kV tower usually has 25 to 35 sq. metres of paint work per ton of steelwork.

Mr. Bornquist (Sweden) said that good paint work should last about twelve years inland and eight years near the coast. They had found in Sweden that first-class galvanising gave better results than the most careful painting. Structures made up with broad flange beams took paint much better than light angle or trellis work, and cost less to paint.

Posts and Towers.

Mr. Paul Ferrier presented a report on "The Influence of Flexibility of Supports on the Mechanical Strength of Lines." According to the author, most of the mechanical accidents to lines are due, not to insufficiently severe regulations or to lack of compliance with them, but to fortuitous circumstances which cannot be provided for within economic limits of cost, such as the falling of a tree or of a rock, a sliding of foundations on a hill side, the flooding of foundations, the breakage of a post from a blow from a lorry or from damage to the conductor made during erection.



A RURAL automatic sub-station used in the U.S.A. The two 13 kV pole-top switches connecting to either of two supply lines are equipped with selector control for automatic transfer of the load in case of failure on the normal supply. The outgoing 2 300 V feeders are equipped with voltage regulators and cross-arm mounted. The oil circuit breakers have an automatic re-closing device.

Regarding the influence of ice, the French regulations make no allowance for it except in mountainous regions, where in some cases a radius of 10 cm. (4 in.) has been met with, giving rise to much trouble. In matters relating to security, it is important to study the effect on the supports in case of the breakage of a conductor.

Examples are given showing that supports with a certain amount of flexibility are relieved of a material amount of strain in the case of a conductor breakage, whereas posts on each side designed for rigidity may be damaged, if not broken, by the strain, one alternative being to have the arms with less resistance than the support. It is pointed out that if no movement is allowed for, the cost of the support may become prohibitive.

Where long spans and chain insulators are concerned, the difficulties in the calculation of torsion and other stresses are discussed, the nature of the accident leading to the breakage of a conductor having a very material bearing on the stresses to be carried. Besides static stresses, supports can be subject to shocks due to the speed of movement of the conductor masses concerned when a breakage takes place. The effect of the insulator chains is to modify this. The shock is the greatest when the chain is very long and the tower very heavy and rigid. The effect, however, is diminished according to the inertia of interposing bodies.

Examples of Breakages.

An example was given of an accident on a line of 30 000 V with 6 conductors of 8 mm. dia. and 50 metres span, with rigid posts of small resistance. A rock of 2 cwt. fell on the line; the posts on each side were broken, but the conductor was not.

On a light line with three conductors of 3 mm. dia. and flexible centrifugally cast concrete posts, a tree fell, breaking a conductor in the next span; the pole between the tree and the broken conductor slightly exceeded its elastic limit and continued to carry the load.

Among means designed for the purpose of limiting stresses on supports are rotatable arms, or arms which will bend under excessive stresses.

It was also pointed out during the discussion on the paper that where Post Office lines or low tension lines are close up to secondary distribution lines at high tension, any material amount of flexibility of supports might give rise to highly dangerous contacts between the high tension and other circuits.

Mr. Darreus said that the question of articulated posts was still being studied. The foundations were the important point, as it did not matter much what happened to a bridge if the foundations had given way.

ELECTRIC POWER SYSTEM DEVELOPMENT.

Providing for Future Expansion—European and American Practice Contrasted—Positive Safety for the Public—A System with True Neutral Point.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E., Fel.A.I.E.E.

ONE of the most important problems of transmission and distribution system design and installation is to avoid limiting the maximum possible development of the whole; in other words, to instal that transformer system allowing of the absolute maximum development and most economical expansion of the system and lines connected thereto without making any of the existing transformers obsolete, and without changing line insulators.

It is very rare for any system to require more than 100% increase in line voltage, but, a vast number of systems would, at the present time and in the near future, welcome such a relief and opening for expansion and future electrical development, provided the 100% increase in line voltage did not increase the voltage stress on insulation more than 15% above the ordinary change from delta to star, which latter system permits of only 73% increase in line voltage. As such a system is not actually in being, and is the subject of a forthcoming article, it is evident that we are not following out the principles referred to here.

Designing for the Future.

As a result of the present-day impetus in electrical development we are likely to record an unprecedented electrical expansion in the next few years sufficient to bring about serious reaction and unwarranted expenses, etc., if we have not been, and are not now, specially careful in our designs and installations. A careful consideration of the transformer system and line insulation to put in, may avoid many future complications as well as heavy expenditures and losses. It is, of course, customary for engineers to design for future loads with an eye to the future development, but, have we installed and are we installing that system capable (at some future date) of being converted to an equally reliable and safe system offering the least possible losses and expenditures, as also a minimum of interruptions to service?

In this country and in Europe, the general practice up to the present time has been the installation of polyphase core type transformers and the star-connected system. In other parts of the world, especially on the American Continent (U.S.A. and Canada in particular), the general practice has been the installation of single-phase transformers and the delta-connected system. A careful study of these two distinct practices, which revolve around other questions inter-related with each system, will reveal some of the reasons why one country enforces (by strict laws based on sound judgment and experience) *multiple earthing* of the neutral point or wire, and, why the other old-established practice asks for a perfectly insulated system throughout, or a system with *one* earth connection at the supply end only. In this country we are prone to blame the P.M.-G. for certain past and present unreasonable restrictions, but, can we claim to be entirely free from originating the major causes of interferences and troubles and so forth?

Our first duty is to instal and operate a system that not only best meets the requirements referred to above, but also provides *real* and truly positive safety for the public. The so-called "cure" as provided at present does not cure. With

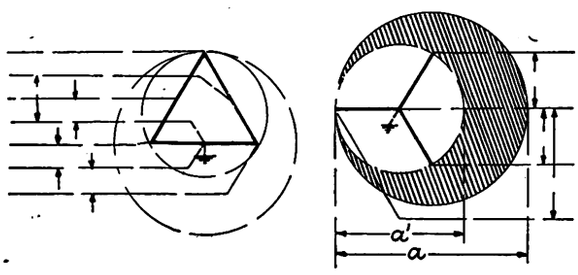

Fig. 1.—The star-connected four-wire system compared with the commonly used delta-connected 4, 6 or 7-wire system for general distribution.

the present law and methods of installation, the real cure is largely left to the consumer who knows nothing at all about the laws or the installation. That is to say, safety to life largely depends upon the consumer, yet specially trained engineers knowingly expose and leave the layman to a hazard and danger *they can positively cure*.

In view of the fact that the consumer is not allowed any say in the choice of system, or the minimum operating secondary voltage of 230 V, why levy higher costs, heavier losses, greater dangers, and shorter life of lamps, etc., against him or her, simply for the purpose of satisfying the requirements of the electricity supply authorities in the matter of initial reduced copper costs and circuit operating losses on load, which do not concern nor apply to the consumer? If the consumer knew, and it is our duty to have him know, that the 115 V lamp circuit is better for him than the 230 V circuit, the authorised

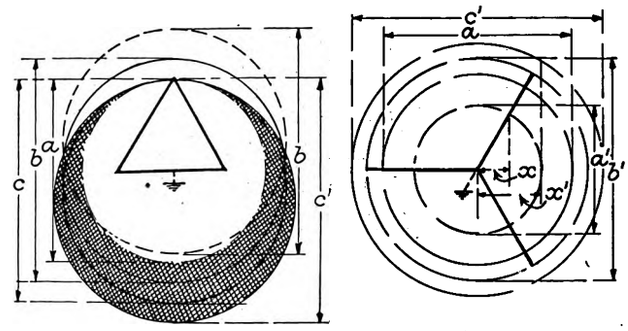

Fig. 2.—Showing the relative positions of maximum voltage to earth and the magnitude of maximum voltage to earth from one earthed point, respectively, for the different systems. References :—

(*a*) Relative maximum voltage to earth for the *delta* system; (*b*) Relative maximum voltage to earth for the *star* system converted from the delta system; the line voltage is now 73 per cent. higher (the same as *b'*); (*c'*) Relative maximum voltage to earth for the system proposed† by the writer, converted from the delta system; the line voltage is now 100% higher, but the maximum voltage to earth is no higher than 11·5% that of the higher voltage *b* and *b'* star system, and a true neutral point is provided.

(*a'*) Relative maximum voltage to earth for the star system where the line voltage is that of the delta system of (*a*). In this case the maximum voltage to earth is *x* volts lower than the delta.

(*b'*) Relative maximum voltage to earth for the delta system (*a*) converted to the higher voltage star-connected system.

† Patents pending.

government department should provide for his protection in all its aspects. For instance, in general, the *higher* voltage installation costs more, the lamps cost more, the life of lamps is shorter, the danger to life is greater, and the energy consumption per gasfilled lamp is much higher than that of the 115 V lamp. All these are against the consumer's interests, etc., because of the system installed, the law, restricted practices, and the consumer's lack of knowledge.

The least of the several possible dangers is from direct contact with the (230 V) non-current carrying part of a fitting, which said part should always be effectively and properly earthed. This hazard can never be overcome until a law is passed to the effect that the neutral wire of every installation be *effectively and properly earthed*. To have one independent earth-connection for each fitting, and isolate it entirely from the earthed neutral wire, is asking for trouble. To have one earth connection at the supply end only, and then independently earth each fitting on consumer's premises is not much short of laying a danger trap for the consumer to fall into at some time or other. These practices are not cures.* Are we to blame the consumer, the P.M.-G., the installation, the system, the law, or ourselves?

Third Harmonics.

It is common knowledge that a three-phase core-type transformer has the advantage of third harmonics, and that such a transformer is rarely connected in delta-delta; on the other hand, the delta connection eliminates third harmonics from the line and it is the connection and system admirably suited to secondary distribution. The delta connection allows of the most flexible and adaptable system, balanced currents, widest use of single-phase units, and a system offering the greatest future expansion for the least future cost and losses, etc. Perhaps the chief objection to the delta system is that it is without a true neutral point; the proposed system has overcome this and other objections.

With a three-wire star-connection thirdha rmonic voltages may exist between the line phase-conductors and the neutral

* Discussed at greater length in the writer's forthcoming book, "Electricity Supply Transformer Systems," now in the press.

Digitized by Google

or between the line conductors and earth, but not between the line phase-conductors; on the other hand, third harmonic currents do not exist in symmetrical three-phase three-wire transformer systems, i.e., in the magnetic and electric circuit of the transformer system with the common three-phase transformer operation. However, with a four-wire star-connection the third harmonic voltages from line phase-conductors and the neutral or between the line conductors and earth are partly (perhaps completely) suppressed, and third harmonic currents may flow through the line phase-conductors and the neutral conductor from the neutral point.

With a three-wire delta-connection third harmonic voltages in the line phase-conductors and between them are completely suppressed, and the third harmonic current cannot flow in the line phase-conductors and between them, but will circulate around the regular closed polygon (around the closed delta). With the three-phase four-wire symmetrical system proposed by the writer, the fourth wire and neutral point is in the main circuit of the closed delta. This is important and advantageous in view of the fact that the four-wire star-connected system provides that a connection be taken from the neutral point in such a manner as to allow third harmonic current to flow, and third harmonic voltages to neutral may not be completely expended in forcing the currents around the circuits.

The star-star system has no further expansion reserve, and usually requires a delta-tertiary winding. A conversion from delta to star at any one or more points of a system will change the phase relations, and, depending on the circuit or system and its extent and magnitude, may cripple parallel operation of all other parts of the same system. Due to reaching the full carrying capacity of the connecting lines of a transformer system, a decision on the conversion of a delta to a star-connection depends on whether the existing system is a delta-delta, a delta-star or a star-delta; in any one case the existing conditions will be improved and the future requirements more economically met than in the case of an existing star-star system change to a higher voltage.

For future economical development of the distribution system and for other reasons it is fortunate that many existing systems possess a delta, or are connected in delta-delta. The extra investment for delta-connected transformers has in every case proved the greater adaptability, flexibility, etc., of that system, and, now that many connecting lines are operating at their full current-carrying capacity for an absolute minimum amount of expenditure, the delta system possesses the advantage of economic future development. The initial first cost of the star system is, of course, cheaper than the delta. For equal carrying capacity of the connecting lines, the star-star system cannot be compared with the star-delta or delta-delta, which two latter (especially the delta-delta) allow of the maximum possible *carrying capacity of the whole* and not a part of the whole, which the star-star system provides for. There should never arise a necessity to convert a delta-star or star-delta system to star-star.

From the time a transformer is bought, the endeavour is to make it pay for itself as soon as possible; hence, the most adaptable unit should prove the most valuable. The carrying capacity of connecting lines (the primary and the secondary lines) are relatively more important than the particular size of the transformers connected thereto because their duplication is usually simpler and cheaper than the duplication of lines. Almost without exception, transmission and primary distribution lines should be so designed and constructed that they, and the existing transformer system connected thereto, are not limited in their expansion to "*full development.*" The most adaptable transformer is the single-phase unit, and the transformer connections allowing of full development of the whole system are the delta-delta—delta-star or star-delta coming second. In the writer's proposed system the delta connection (the closed polygon), shown in Fig. 1, is never broken for a 50% or a 100% increase in line voltage.

The Delta-Delta System.

When the connecting lines of the star-star system attain their full carrying capacity, the whole transformer system and line insulation have as a general rule attained their full development, the next in order is the delta-star, and the system with a maximum of reserve and flexibility and adaptability and so forth, is the delta-delta. In a further article it will be shown that the delta-delta system allows of a plurality of future changes to a higher (standard) line voltage and permits of the full use of all existing transformers whether they be delta or star connected, and use of the same line insulators, whereas, the star-star system will permit of one change to a higher line voltage, but, in so doing, all existing transformers become obsolete and all line insulators must be changed, etc.

Several reasons exist for changing from one standard voltage to another standard, but the main reason often given is that of increasing the kVA carrying capacity of the connecting lines (primary and/or secondary). Obviously, whether we change from delta to star or from star to delta or star we must increase the kVA capacity of the existing transformers if we desire to make use of the increased kVA carrying capacity of the lines connected thereto. The star system is worse off than the delta system because the increase in line voltage makes all existing star-connected transformers obsolete. If the existing system is a delta-star or a star-delta, a conversion of the system to star-star will usually require additional transformer capacity in the form of delta-tertiary windings, as well as additional transformer kVA capacity for taking care of any greater load; moreover, three additional phase-units are required for the star conversion, whereas for the writer's proposed system only the half windings of two single-phase-units are required for a 50% increase in line voltage.

Increasing Line Voltage.

The change in voltage from delta to star is usually not from one standard to another standard. Secondary distribution will usually allow of 100% increase in line voltage without considering changes in line insulation, and a 100% increase in line voltage usually meets the change from one standard to the next, but not so when changing from delta to star, which offers a 73% increase in line voltage; this same reasoning also applies to the primary distribution voltage up to about 3 300 V. However, for the higher voltages up to about 33 000 V the line insulation must be considered. For still higher line voltages, up to 200 000 V or higher, the best standard change is 50% increase and not 57·7% increase. The 50% increase in line voltage is better for existing line insulators, better meets the next higher voltage *standard*, sufficiently serves the needs for increased line carrying capacity, necessary voltage regulation, etc. The following table serves to illustrate the odd change in voltage when converting from delta to star, also, when changing to the system proposed by the writer, which offers a 100% increase in line voltage for less than 12% increase in voltage to earth compared with the conversion from delta to star, which also has 100−73=27% higher line voltage as compared with the star.

Voltage of the delta and "V" system.		Conversion from delta to star.		Writer's proposed system.		
SECONDARY DISTRIBUTION—	100	100—	173	100—	115—	200
(These voltages will always	105	105—	182	105—	120—	210
allow of a 100% increase,	110	110—	190	110—	125—	220
and, the increase gives a	115	115—	200	115—	130—	230
better standard than the	120	120—	208	120—	138—	240
star conversion from delta.)	200	200—	346	200—	230—	400
	210	210—	364	210—	240—	420
	220	220—	380	220—	250—	440
	230	230—	400	230—	260—	460
	240	240—	416	240—	275—	480
	250	250—	430	250—	280—	500

(Converting the delta system to the writer's proposed system to provide for a 100% increase in line voltage will create a small percentage increase in the maximum voltage to earth above that of the delta shown in Fig. 1, and will require two additional single-phase units whence the kVA capacity is automatically increased to answer this cause of line voltage increase. This increase in voltage to earth is not objectionable and increased kVA capacity is absolutely necessary for all systems.)

PRIMARY DISTRIBUTION—	2 000	2 000—	3 460	2 000—	2 300—	4 000
(These voltages will gener-	2 200	2 200—	3 640	2 200—	2 500—	4 400
ally allow of a 100% in-	2 300	2 300—	4 000	2 300—	2 600—	4 600
crease provided the increase	3 000	3 000—	5 200	3 000—	3 450—	6 000
in maximum voltage to	3 300	3 300—	5 700	3 300—	3 800—	6 600
earth is not greater than	5 500	5 500—	9 500	5 500—	4 600—	11 000
15% that of the conversion	6 600	6 600—	11 400	6 600—	7 600—	13 200
from delta to star—this	11 000	11 000—	19 000	11 000—	13 200—	22 000
increase gives a better standard than the star conversion from delta.)						

(A common practice of the primary distribution line is to over-insulate by 20% or even 50%; this, therefore, permits general use of the writer's proposed system without change of line insulators.)

HIGHER VOLTAGE, TRANSMISSION—	22 000	38 000	33 000
(These voltages will always	33 000	57 000	50 000
allow of a 50% increase,	44 000	76 000	66 000
provided the maximum	66 000	114 000	100 000
voltage to earth has not	88 000	152 000	132 000
been increased: this in-	100 000	173 000	150 000
crease gives a better	110 000	190 000	165 000
standard than the star con-	132 000	228 000	200 000
version from delta.)			

(Converting the delta system to the writer's proposed system to provide a 50% increase in line voltage will not increase the maximum voltage to earth above that of the delta shown in Fig. 1. None of the existing transformer connections need be disturbed, and three or four of the six or seven wires can be dispensed with. Only two additional half single-phase windings are required, hence the change-over of e.h.t. systems can do with less, or no more additional, windings than the star conversion required to satisfy the increased kVA capacity of the connecting lines.)

The common delta-connected distribution system for combined light and power service conforms, as a general rule, to that shown in diagram on the left of Fig. 1. This earthed-return method (requiring from four to seven wires) is the best practice so far employed in any country.

LIGHTNING TESTS ON FULL SIZED INSULATOR STRINGS AND TOWERS.

The Equipment Used at a Novel Outdoor Laboratory—Cause of Low Flashover Voltages—Staying Wooden Structures.

AN interesting account of an outdoor laboratory designed and equipped to carry out tests on insulator strings and line-supporting structures was given by Mr. A. O. Austin, engineer of the Ohio Brass Co., Akron, Ohio, at the recent Paris Conference on Large Electric Systems.

The space allotted for testing is an area about 1 100 ft. by 500 ft. Structures of various types are placed on trucks on rail tracks and can be run into any position required, and anchored if necessary. The main transformers are placed at one end of an alleyway, down the centre of which run the connections.

The plant used includes 3 transformers, each of 750 kV, of the same type, a 400 kV transformer, a portable 10 000 kVA 1 200 kV oscillator, two 5 000 kVA 850 kV oscillators, one of which is arranged for super-imposing high frequency on normal frequency, a series of 11 generators from 125 to 1 000 kVA to

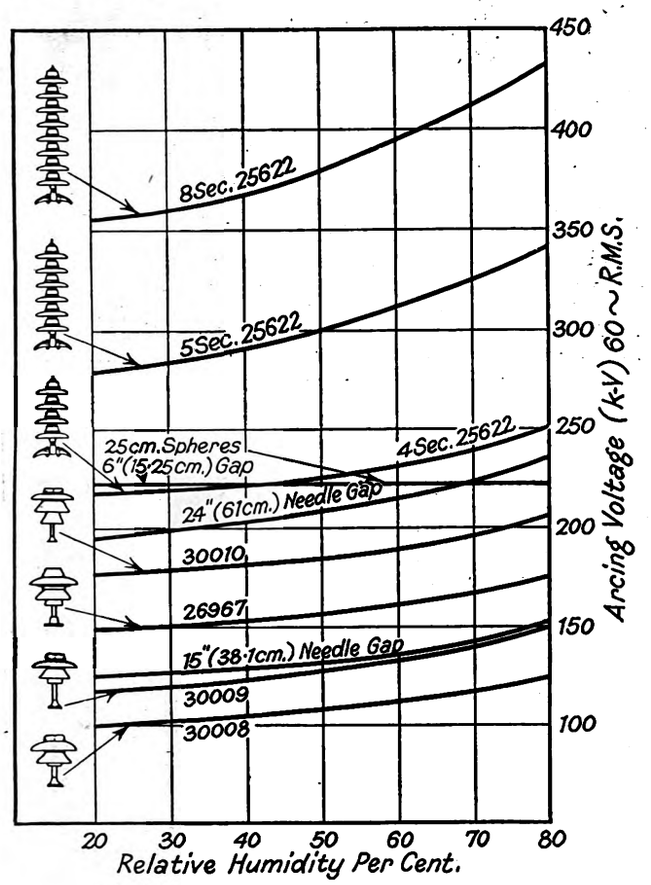

Fig. 1.—Tests on insulators with variations in humidity.

give from 12½ to 500 cycles per sec., a Poulsen arc set and loading coil for generating continuous wave energy, a series of sphere gaps, the largest having spheres of 150 cm. dia., a Dufour oscillograph, and two Klydonographs.

There is a large variable air condenser for storing energy for impulse tests, and more than 50 different transmission line structures of steel and wood as used on many important lines, with a collection of auxiliary apparatus. Tests can be made on individual structures at normal frequency under a damped wave or under an impulse, either singly, or with several structures in multiple.

Arrangement of Transformer Bank.

The transformer bank is arranged in a special way. Instead of exciting the low tension coils off a common system each transformer is insulated and excited by an insulated generator, driven through an insulated shaft by a synchronous motor.

By this means the full output of each 750 kVA transformer is obtainable, the combined kVA being the sum of all the transformers in series. When the transformers are in chain connection the kVA combined output is that of the smallest transformer of the group, the regulation being exceedingly good with the new arrangement; Fig. 5 shows the transformers; Fig. 2 the system of multiple excitation.

The system of synchronous motors can be phase-operated

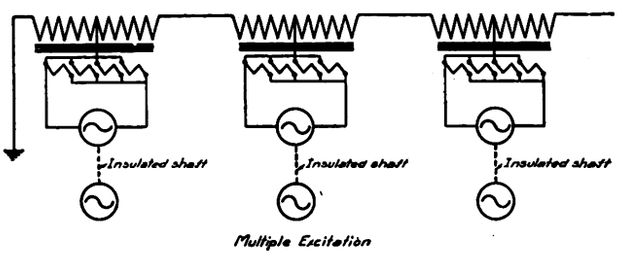

Fig. 2.—System of multiple excitation.

independently. Relay problems can therefore be studied. Various transformer connections can be used—Delta, open or closed Y, grounded or ungrounded, T-connected or quarter-phase. As the generators are insulated excitation is provided by storage batteries placed on balconies around the main transformers.

The transformers are of the shell type with the centre of the windings grounded to the tanks. The bank has been operated to develop a crest voltage of over 3 300 000 V to earth. At voltages over 2 000 000 to earth it is difficult to prevent flashovers from leads or other equipment. The transformers are mounted on tile piers of insulating porcelain (being like generators on the Thury system in this respect).

Field Regulation.

Fig. 4 shows the condenser cage, two impulse gaps and the transformers in the background. Fig. 3 is a diagram of equipment used in running impulse or artificial lightning tests. The transformer bank is used to charge the large air condenser. By means of a master control switch the generator fields are regulated so that the transformer voltage builds up until a flashover of the impulse gap takes place. A synchronous switch operated by the generator shorts an impedance a few per cent below the flashover voltage of the impulse sphere gap, so the gap discharges on this alternation. This makes it possible to determine the polarity of the impact and to operate synchronous switches for the taking of the cathode ray oscillographs for photographing and making other measurements. By means of this arrangement photographs can be taken in the strongest daylight, and working hours are greatly extended, and inconveniences of night testing avoided. It is possible not merely to control the polarity of the firing wave, but also to synchronise the operation of the cameras, etc.

From theoretical and from available information there is

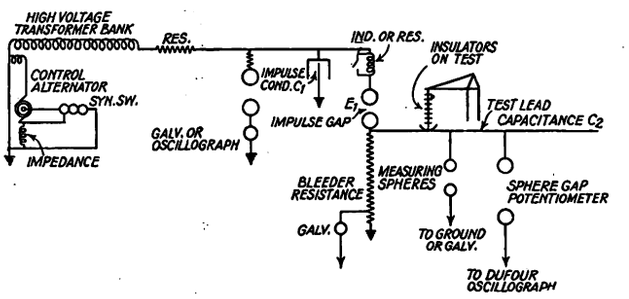

Fig. 3.—Equipment for impulse tests.

good reason to believe that while wave points may vary to a considerable extent, the tail of the wave on the transmission line will be rather long. The potential operating for a longer time on the tail of a wave will to a large extent determine the flashover of the insulator.

Tests tend to show that it is a mistake to arrange strings

H.T. OUTDOOR SUB-STATIONS.

THE advantages of building outdoor sub-stations in standardised sections are illustrated in the above drawings. By suitable arrangements framework members can be standardised on which apparatus of various types can be mounted. Three styles of sub-station arrangement are shown above. The first is what might be termed a built-up type ; the second the sectional ; and the third the flat or low-level type. The Star-Delta Co., of Chicago, who have developed this type of equipment, can, by the use of a rotating bus selector switch, reduce the amount of dead conductor. The number of insulators can also be reduced. With the aid of standardised frames sub-station structures can be ordered from stock and erected with great rapidity.

LIGHTNING TESTS ON INSULATORS.

(*Continued from page 217*)

with a section length too long for the insulation in the disc, as a very low flashover voltage may follow. Increased tower clearance is necessary, and increased reactance from increased spacing results.

Fig. 6 shows the flashing over of a 16 section string on a steel structure while a 6 section string on a wood post remains intact, positive impact with 1 230 000 V crest. The wood post is fitted with a protective gap.

It is often necessary to stay wooden structures. Where the stay is not insulated the increase in flashover of wood as compared with steel is lost ; wood stays have therefore been developed. The author gives data regarding the operation of impulse tests. Oscillator tests show that a structure that will give good results under them will give even better results under an impact. Tests have shown that an insulator string that flashes over at 665 kV with steel hanger arms, has stood 1 015 kV with wood cross arms.

Many interesting tests have been made at the laboratory, not merely regarding research, but also with the object of increasing the flashover voltage of existing lines.

The Ohio Brass Co. also operates two indoor laboratories, one adjoining the test field, the other at the insulator works. Fig. 7 shows the transformer at the latter. It is also insulated by porcelain slabs. The generator is of the General Electric Co.'s (U.S.A.) type, to produce sine waves, it is driven by an insulated shaft. The low voltage side is provided with a number of coils and a drum controller, so that but little variation is necessary in the generator voltage. Fig. 1 shows tests on insulators with variations in humidity.

In the new laboratories an attempt has been made to carry on a class of work very desirable for transmission line operation, but which cannot be carried out with advantage in other laboratories.

BOOK REVIEWS.

Operational Circuit Analysis. By VANNEVAR BUSH, with an Appendix by Norbert Wiener. (London: Chapman and Hall.) Pp. x+392. 22s. 6d. net.

As a definite attempt to bridge the chasm so often separating the engineer from the pure scientist, this book is deserving of high praise. The mere mention of mathematics to many present-day electrical engineers is so often sufficient to produce a distinct air of boredom that an effort to deal with problems involving mathematics in a way that will be intelligible and interesting to the non-mathematical reader is distinctly desirable. As the author—who is Professor of Electric Power Transmission at the Massachusetts Institute of Technology—is careful to explain, he writes as an engineer without any pretence of being a mathematician, though, as he also points out, he has received help from mathematical friends.

Whilst acknowledging the value of the "shorthand" processes such as are used to perform the algebraic work necessary for the symbolic solution of alternating current networks in the steady state, the author maintains that this is computation, and not analysis, and that in order to extend the operational method to apply it with freedom and safety, and to save time by the employment of its directness and simplicity on new problems, it is necessary to have at least some grasp of the classic mathematics of which it is the working tool.

As this entails a grasp of Fourier analysis and of its treatment in terms of the complex variable, Prof. Bush regards the operational scheme as a good line of approach, and therefore includes a brief survey of certain essential parts of the classic treatment. While there is no claim for completeness in this survey an attempt is made to include all the essential features of the Heaviside type of operational analysis, and to show their dependence upon the classic processes which constitute their background. It is appreciated that this may make the reading difficult for students unfamiliar with certain branches of mathematics, but if it demonstrates the desirability of extending their mathematical equipment along the lines indicated it will serve a useful purpose.

B. L. C.

Electromagnetic Problems in Electrical Engineering. By B. HAGUE, D.Sc., Ph.D. (Oxford: University Press; and London: Humphrey Milford.) Pp. xiv.+359. 30s.

Electrical engineering is a powerful complex of physics, mathematics and engineering science. No branch of engineering practice is closer to basic principles, and in none has the rapid advance in the size of machines brought out the need for still closer investigation of the deeper problems of the subject. These fall into two groups, dealing with the distribution and influence of magnetic or electric fields respectively.

Dr. Hague's book is a practical study of the former, but much of it is applicable with slight modifications to problems of flux distribution in insulation. It strikes a new note in the technical literature of magnetism by its range, the elegance of the methods, and the results obtained. It deals only with the fields due to current-carrying wires in the presence of magnetic masses, and to the mechanical forces caused by their reaction, but it will be recognised that this covers most of the problems of the electromagnetic machine except those of voltage generation. There is certainly no book in technical electromagnetism which deals so fully with the first principles of the subject in their bearing on practical problems. It is, as the author says, "an attempt to develop the theory of dynamo electric machinery and allied apparatus as a branch of electromagnetic theory" to the same extent that the theory of, for example, wireless telegraphy has been developed from the same elemental laws.

In the early chapters these laws are clearly stated and the definitions carefully set out. The general theory of the magnetic field of a current is given, and a note made on boundary conditions at an interface. This is carried further in Chapter IV, using the method of images in surfaces of infinite and finite permeability, the method being that of Dr. Searle, from which, in a sense, the book began. Simple cases of electromagnetic images in circular cylindrical surfaces with finite permeability are considered, and the boundary effects of fields due to wires embedded in concentric circular cylinders are treated at length by the use of Fourier's Series. The theory of the mechanical forces on linear conductors near iron and the general theory of mechanical stresses in magnetised media and conductors embedded in a plane-faced iron mass complete the first part of the book.

The second part deals with applications, all of great interest. One after another of what have been considered until recently almost insoluble problems of the magnetic fields of currents in the presence of iron boundaries are treated by the methods of Part I, and the mathematics are not difficult.

Chapter VII, on the forces on conductors near plane iron boundaries, is valuable in connection with the forces on the end windings of machines. The next important chapter is on the case of fields in the gap between concentric cylinders, and is that of the induction motor or of the non-salient dynamo electric machine in its simpliest form. This is again treated by Fourier's Series for single wires, current sheets, coils and groups of coils, leading to the well-known expressions for the distribution factor due to such a group. Following the same logical analysis the electromagnetic forces or conductors in a concentric air gap are given. From this point onward the problems grow in difficulty and fulness of treatment of the previous cases but with finite permeability. Chapter XII is an extremely interesting examination of the fields in conductors of various shapes of sections. These problems cannot be solved by the Hele Shaw liquid flow method without much difficulty, but they yield to the analysis and give curves which are as useful as the analogous de Venant's curves of mechanical strain in similar sections. Rogowski's treatment of leakage fields in transformers with various groups of winding is summarised, and important practical expressions derived. Roth's analysis by Fourier's Series of the fields due to conductors in slots, and of transformer leakage, is referred to and examples given.

The book closes with a discussion of the mechanical forces in simple practical cases between currents and within conductors. It should be in the hands of every up-to-date designer of electrical machinery, and to the advanced student of electrical engineering it is a valuable example of precision of method, clear writing and lucid solutions.

W. M. THORNTON.

Groundwork of Calculus. By WILLIAM HUNTER. (London: University Tutorial Press.) Pp. 220. 5s. 6d.

The elements of the calculus are being taught at a much earlier age than previously, and questions thereon are now included in the more advanced mathematics papers of the London Matriculation and similar examinations. This and similar books are the direct result.

The ground covered is considerable, and the applications mentioned cover all that is required for the elements of mechanics and physics. In fact, the ground covers most of what will be required by the average engineering student for the greater part of his studies.

Since the proof of the pudding is in the eating the book was lent to a beginner in the calculus, who commented that it laboured too long on elementary facts which everyone should know (at any rate, anyone of matriculation standard in elementary mathematics) and was therefore dull.

When reading the book through one finds it difficult to see the wood for the trees. The slow progression through elementary examples in the earlier parts causes a certain haziness and apparent lack of direction, though the individual paragraphs are quite lucid. The latter parts are more concise; in fact, they seem too advanced for the opening.

There are one or two rather doubtful statements. For example, without in any way defining a tangent, the author bluntly states that "The gradient of a graph at a point is the gradient of the tangent at that point," and leaves it at that. The definition of a tangent as the limiting position of a chord does not appear until 17 pages later.

However, a "class" book can only properly be judged by its use with a class, and this book should be judged from the point of view of a class or a correspondence course, and no doubt Mr. Hunter has found an abundance of detailed illustration essential in teaching the calculus to beginners.

There is a bad misprint on page 41—six lines from the bottom—*dy* being substituted for *dx* at a crucial point of the argument.

ADVERTISING AND THE STANDARD OF LIVING.*

Publicity as an Important Raw Material of Modern Industry—The Vital Problems of Distribution and Consumption—Importance of Making it Easy to Buy.

By SIR ERNEST BENN, Bt.

THIS is a business convention and it would, therefore, be out of place to make any reference to political matters. In England, and I believe to some extent in other countries, politicians are very prone to talk nonsense about business, but business men with a Christian humility which, if not completely wise is at least thoroughly characteristic, impose upon themselves a self-denying ordinance, and refrain from talking politics.

There are, however, two observations of a semi-political nature which an Englishman, having the honour to address a Berlin audience, is in duty bound to make. The first is with regard to political arrangements, peace treaties and such like things, existing between these two great nations. It should be recognised that in England as in Germany we are by no means unanimous in thinking that all that has been done since 1918 is the embodiment of perfect wisdom. There is, I believe, a growing consciousness of failure to serve to the full, either the ends of justice or the sacred cause of international peace.

It would be improper to go beyond vague generalities such as these at an advertising convention, but in my second observation I am on safer and less controversial ground. The cause of peace and international goodwill can be furthered in no surer or better way than by business meetings such as the one in which we are all taking part this week. Business men or advertising men of different nations can meet on common ground, find common interests, develop understandings and render mutual aid far more readily than is possible in the meetings of statesmen and politicians. This is not because business men are necessarily better than statesmen or politicians (although I have my own views upon that) but because of the very nature of the matters upon which they are severally engaged. Trouble is the life-blood of politics, while the absence of it is the very breath of business.

Widespread Demand.

The healthy fashion of the age is to discuss the social well-being of the people. If only words were deeds the world is full of the possibilities of a better, happier, more plentiful life for the masses of the people who inhabit it. From China to Peru, and from Iceland to the Southern Seas, people everywhere are clamouring for the fruits of the earth and the products of the work of man; and there is no good reason why a large proportion, if not most, of these very reasonable desires should not be realised.

But the business man, with the possible exception of the American business man, has failed to make it clear to the common people that he, and he alone, is capable of satisfying these very proper desires. The people are making the mistake of looking to the politician instead of to the business man, and it is unnecessary for me to tell you that they are looking in vain.

I am anxious that this great International Convention should make it clear to the world that advertising has a definite place in any sane scheme for raising the standard of life of the people. Advertising is not, as some people still seem to think, a luxurious superfluity which can be added to a business that is rich enough to carry it. Advertising must be recognised and classified as one of the most important of the raw materials of industry. Our political economy needs to be brought up to date, and this Convention can do something to help along that long overdue process. The standard of life of the people depends upon two things, first the production and secondly the distribution of wealth, things, goods and commodities.

The economic situation of the world as a whole can be stated in the very simplest terms. Great problems are always simple when considered in a large way; it is chiefly in the details that the difficulties are to be found. If therefore you look at the world as a whole you will notice that we succeed fairly well in the making of things, but have yet a lot to learn about the distribution of them.

I want this great conference to rank above all the political conferences with which Europe is littered, and to impress upon the minds of the people of the world that the raising of the standard of life of the whole people is a matter of selling and distribution. In other words, a matter of advertising. The political economy of the immediate past has devoted far too much attention to production and far too little thought to consumption. The politicians of the world have done far too much pampering and spoiling and ruining the so-called workers, and have forgotten that the buyer, the customer, the consumer, is, of necessity, the predominant partner in industry and commerce. You can devise machines to take the place of labour, you can evolve substitutes for almost every raw material, but the one and only thing that you cannot do without, that is absolutely indispensable to any industrial system, is your consumer.

The sales managers and the advertising men of the world are the only people who appear to appreciate that basic truth. In my opinion, if it were possible, for, say a decade, to forget altogether the worker, to wipe him out of our minds, and to give all our thoughts to distribution and consumption, we could fill the world with wealth.

Advertising and Economics.

I do not remember in England the case of a single advertising man who has made much mark in politics, and this is natural when one remembers that advertising is based on sound practical economics. Modern politics makes the mistake of filling the whole picture with the worker. Advertising is wiser and recognises that the buyer is the all-important factor in the economic problem.

The same sort of criticism may be made in a more moderate way of the world of finance. The development of banking and credit machinery in the last 100 years is one of the miracles in human history, but that machinery is not yet complete. Our bankers and financiers have provided all the facilities that the world can want for the purpose of production. They have yet to recognise the enormous possibilities of the finance of consumption and consumer credit.

We must create a world in which it is as easy to buy as it is to make, and advertising in all its forms is the basis on which this great object will be accomplished.

When the economic conversation of the common man is not nonsense, it concerns itself too much with questions of minor importance. Think of all the breath that is wasted in discussing what are called basic industries and of all the money and political effort that is expended in the endeavour to bolster up these basic industries with artificial aids.

The Consumer's Viewpoint.

Iron and steel are of no interest to the ordinary man and woman until long after they have left the furnaces, of which we hear so much, and have been sold, by advertising, as kettles or motor bicycles. I have never seen, and have no desire to see, an ingot of steel or a mass of pig iron, but I am deeply interested in the nib of my pen or the pattern of my garden gate.

Coal, so far as I am concerned, need not exist but for my need of the products of the furnace that it feeds.

Shipping, on which we set such store, is an empty, seasick affair but for the advertising which teaches each country of the products of the others.

Take again the nonsense that is talked about the simple life; the absurd people who work themselves into a semi-sane condition and distort all their artistic and poetic values. People who, while pretending to see evil in the desire of a youth for a wrist watch, or a maiden for a new pochette, will find an exaggerated beauty in the gluttonous, vomiting, bestial life of the bumble bee.

It is argued that advertising creates desires for unnecessary and useless things, that it promotes unproductive expenditure, that it fosters a taste for luxury, and that it leads to extravagance.

People who talk this way have never bothered to think,

*An address delivered at the International Advertising Congress at Berlin on August 14th.

Digitized by Google

they simply do not know the meaning of the words they use. They have never troubled to define economy or extravagance. They don't understand civilisation and have no real conception of progress. Civilisation is a process of evolution, in which man's desires, and his ability to satisfy them, march forward together. When we cease to create new desires we stop the process of civilising. Every new desire will be thought at first to be unnecessary, extravagant, ostentatious or anti-social. It has always been so. The first man who wore a shirt must certainly have faced the envy and criticism of all his fellows, and I do not doubt that the Chancellor of the Exchequer of the day picked him out for special punitive taxation.

The fact is, of course, that the luxury of yesterday is the comfort of to-day and the necessity of to-morrow, and behind that natural and wonderful process, the process of steadily raising the standard of human life, the main driving force is advertising.

If you do anything to lessen the desire of people for things, trade and industry and civilisation go down. If, on the other hand, you cultivate and strengthen the desire for a greater variety of material amenities, then civilisation goes forward.

True Nature of Wealth.

The universal social problem is the standard of living of the people. The standard of living is governed by the amount of real wealth in the world, and I submit to you that our troubles arise because of the failure of people generally to realise the true nature of wealth. This conference can do something to rectify that error. All over the world you find the puzzling, paradoxical position of poverty caused by over-production; miners in trouble because there is too much coal; shipbuilders in difficulty because there appear to be too many ships, and so on.

John Stuart Mill, still the greatest of all economists, gave us the most perfectly scientific definition, and laid it down that "Wealth is all things useful and agreeable having exchange value." Every boy and girl who hopes to be considered as a civilised being ought to be made to learn that definition by heart.

"Wealth is all things useful and agreeable having exchange value." You will notice that Mill ignores all questions of manufacture and making, says nothing about production or labour or employment, leaves aside even such important matters as science and design. The only factor in the composition of wealth that he deems it worth while to mention is exchange. Wherever a thing comes from; whatever it is made of; whether it merely grows or is the outcome of infinite labour; however much legislation or tariff or trade union power may be mixed up with it, it is not wealth until exchange value has been given to it. And what is the purpose of advertising, except to give exchange value? If people would give one-tenth of the thought which is now given to false issues about labour and production to the consideration of exchange, salesmanship and advertising, the standard of living of the people would go and keep on going from better to better and better still.

Learning to Sell.

I do not fear that anybody here will misunderstand me when I venture to claim that it is appropriate for this sort of thought to be spoken at an international convention by a delegate speaking the English language. Few will be found to deny that it was England who taught the world how to manufacture the things that go to make modern civilisation. And now, quite appropriately and quite properly, it is another branch of the English-speaking people that is going to show the world how to complete the good work. If England taught us how to make, America is teaching us how to sell—how to advertise. We Englishmen are very glad and proud to be here in company with such a large and talented representation of American advertising genius.

In conclusion, my hope is that this great convention may be able to do something, first, to give to advertising men generally a still higher conception of the importance of their great calling, and, secondly, to give to the world at large a truer conception of the part which advertising plays in the provision of a better standard of life for the struggling masses of mankind. We must strive, as Wordsworth puts it:

> "To elevate
> The grovelling mind, the erring to recall,
> And fortify the moral sense of all."

PUBLIC UTILITY LOANS.

The New Development Act and Electrical Undertakings.

By A SPECIAL CORRESPONDENT.

SUFFICIENT attention has not been paid to a very important Act passed at the end of the last session of Parliament. The Act in question is the Development (Loan Guarantees and Grants) Act, 1929, to authorise the Treasury to guarantee certain loans to be raised in connection with public utility undertakings, and to authorise the giving of financial assistance in respect of expenditure incurred or loans raised for development works.

The Act is part of the Government scheme for tackling unemployment, and the public utility undertakings under Part I are undertakings carried on under Statutory powers by any body of persons for providing means of transport or communication, gas, electricity, water or power. Local authorities and statutory bodies who carry on undertakings under statutory powers otherwise than for profit are *not* eligible for assistance under Part I, as they are provided for in Part II of the Act.

Schemes of development, reconstruction or re-equipment in connection with undertakings in Great Britain come within the Act, and assistance may take the form of either a guarantee of the payment of the principal of and the interest on, or of either the principal of or the interest on, any loan to be raised and applied for the purpose of meeting capital expenditure on such scheme, or a grant to assist in defraying, in whole or in part, during a period not exceeding 15 years from the raising of the loan, the interest payable on such loan.

Capital expenditure defrayed after the passing of the Act on such schemes out of revenue or accumulated funds may be regarded as defrayed out of a loan raised at such rate of interest as the Treasury may determine.

In considering applications, whether for guarantees or grants, regard will be paid to:—

(1) The extent to which the capital expenditure in question is calculated to promote employment in the United Kingdom;

(2) The probability or not of the scheme not being proceeded with in the near future if assistance is not given.

Where the application is for a guarantee the applicant will be required to satisfy the Committee that there is security for the due payment of the interest on and for the repayment of the principal of the loan.

The Chairman of the Committee is Sir Arthur Duckham, and electrical interests are represented by Mr. P. J. Pybus.

ELECTRICITY SUPPLY IN NEW ZEALAND.

The revenue during the year ended March 31st, 1928, from the Auckland (N.Z.) Electric Power Board's undertaking was £574 179, against £517 120 for previous year, and the net profit, after provision for working expenses and capital charges, was £60 999, against £63 556. Electricity generated was 83 426 650 kWh, against 65 544 216, purchased 15 505 420 kWh, against 14 077 010, and sold 80 791 776 kWh against 66 207 786. Total cost per kWh generated was 1·52d. against 1·644d., and total revenue 1·705d., against 1·86 The plant capacity was 27 950 kW, against 26 900 kW, the maximum load 25 600 kW, against 22 610 kW, and the load factor 44·11 %, against 40·19 %. The most notable feature in the year's trading can be seen in the sales for domestic supply. The increase under this heading over the previous year was 9 929 643 kWh, representing £40 476 18s. 11d. When the Board took over the undertaking in 1922 there was no record of any electric stoves or water heaters connected to the system. The number now in use and being steadily connected up is sufficient evidence that this phase of the electric supply business is now coming into its own, and much greater development in this direction may be expected. The universal recommendation given to the electric range shows that customers are now realising that the utilisation of electricity for cooking has the same advantage as has long been recognised in its adoption for other purposes. After due consideration, the Board decided to simplify its charges and at the same time encourage the use of electricity. Some time ago meter rent on the domestic supply was eliminated; then followed the introduction of the domestic rate: 5d. per kWh for the first 25 kWh, 3d. per kWh for the next 25, and 1½d. for all over. All work in connection with the change-over to Arapuni power is just about completed.

MID-CHESHIRE LINES.

Employment of Untreated Larch Poles as Conductor Supports.

REFERENCE has recently been made in THE ELECTRICIAN to the operations of the Mid-Cheshire Electricity Supply Co. We give below a few further details of the overhead line equipment.

The cheap steel tower line which is being erected by the company has normal spans with an average length of 670 ft.; in some instances, where the contour of the land is suitable, spans up to 1 000 ft. are used. The conductor employed is pre-formed 80 ton steel-copper.

We are informed that the residents in the neighbourhood are very pleased with the appearance of the line, and that the company is constantly receiving requests for similar towers to be used for service branches, which, of course, is impossible.

An A-type wooden pole line is also being erected, with spans approaching the lengths used in the steel tower line, and similar conductors, so that the company may readily make comparisons between the relative cost and appearance of the two forms of construction.

By special permission of the Electricity Commissioners this pole line is being constructed of untreated larch poles which are supplied by the Forestry Commissioners. It is well known that larch, alone of the soft timbers, will stand for a considerable number of years without creosoting or other form of treatment. Larch has already been much used for fencing, and also to a small extent for telegraph poles, especially in Scotland.

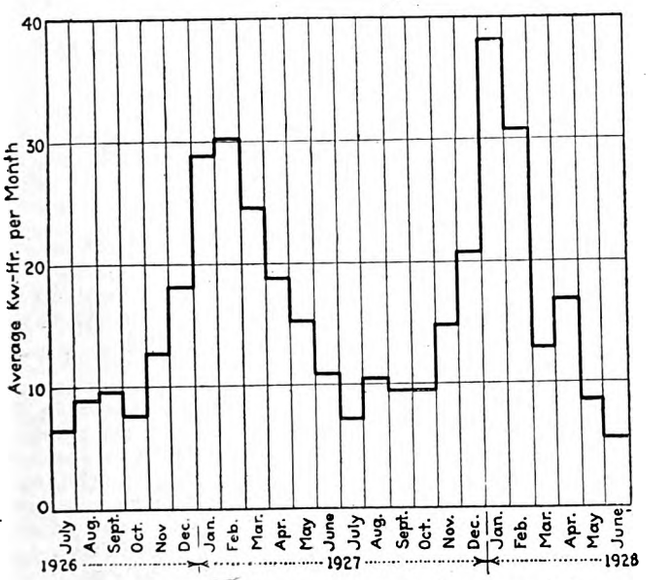
The Mid-Cheshire Electricity Supply Co. is applying for a Special Order to extend its area in a northerly direction beyond its Knutsford development to the vicinity of Altrincham. The approximate area of the extension is 28 sq. miles.

FARM ELECTRICITY.

Iowa Figures Show Low Average Consumption.

AN examination of the electricity consumption on eleven electrified farms in Iowa has disclosed a low average utilisation for most purposes. There was an average of 33 lighting points per farmer, and each outlet averaged 10 kWh per annum. Electric cooking provided the biggest individual load at 1 300 kWh per annum. Milking machines used 330, and water pumps 210, while radio, irons, washing machines and cream separators together took less than 200 kWh per year per farm.

The accompanying chart shows the low average consumption of energy by farm electric motors.



Showing average energy consumption of electric motors on farm.

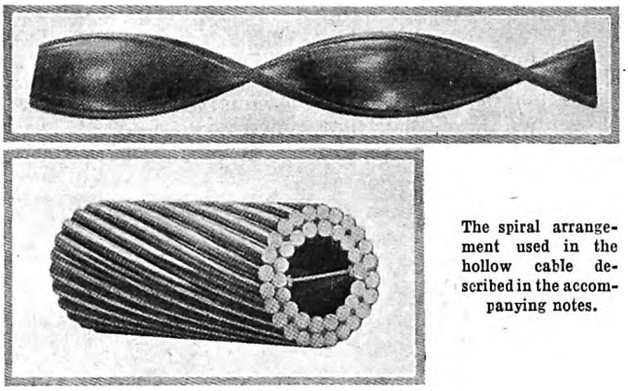
Experience in Iowa suggests that the best sizes of motors general utility use are the ¼ or ½ H.P. for operating hand-machines, and the 3 or 5 H.P. size for operating the formerly worked from a gas engine. The stationary used much less than the portables.

HOLLOW CONDUCTORS.

Their Use on High Tension Lines in the U.S.A.

(FROM A CORRESPONDENT.)

IT is well known that in high tension aerial transmission directly the voltage is taken above the distribution range the effect of corona has to be carefully studied. For instance, at 220 kV, the minimum conductor outside diameter



The spiral arrangement used in the hollow cable described in the accompanying notes.

usually employed is 1 in., and when material currents have to be transmitted skin effect becomes an important consideration.

Various arrangements have been made for dealing with this problem, one being the use of tubular conductors to make up a larger diameter. Cables with aluminium wires with a steel core have certain advantages, having a large diameter and capacity for long spans. In Germany a hollow conductor is being used with a spiral support.

The same problem is being attacked in the United States, where the Anaconda Wire and Cable Co. has tackled the problem by the use of copper conductors arranged as hollow cables. A drawn section of copper in the form of an I beam, with narrow flanges twisted to form a spiral, is placed in the interior, and the individual wires in the inside layer are twisted round in the opposite direction. This form of conductor was described at the Paris High Tension Conference by Mr. T. J. Little.

The ratio between core diameter and cable diameter can be varied within wide limits, so that for a given cross-section the wires may form a thin ring with a large diameter; when necessary for tensile strength for long spans the cable can be reinforced with some non-ferrous high tensile wires; a conductor with a section of 0·4 in. has a core weighing not more than 10% of the total weight of the cable. The cable is more flexible than one of the normal type. It can be strung over erecting sheaves having a diameter ten times that of the cable; for moderate mechanical tensions hanger clamps are used, but for the longest spans a seamless connector is used that is drawn down on to the cable by means of a special tool.

Some Applications.

This type of conductor is being used on a 154 kV line, 118 miles long, in the U.S.A., the cable being 0·769 in. diameter outside, 0·235 sq. in. section, the weight of cable used being about 800 tons. This type of cable is also being used for bus-bars on sub-stations on a 220 kV line.

When the current capacity of a line is high, a large diameter has not merely an advantage regarding skin effect and general efficiency, but also regarding temperature. It is therefore being used for some lower tension lines where corona effects are not to be feared; for example, it has been adopted on a four-mile tie line at 44 kV, where the normal full load is 525 A per circuit, and the maximum 1 050 A. Owing to its flexibility this type of conductor is of advantage for connections between oil circuit breakers, transformers, and so on, as their use reduces strains on bushings. This system of conductor construction has been developed with outside diameters ranging from 0·45 to 3 in., and with sections from 0·08 to nearly 3 sq. in.

Municipal authorities are being asked by Newcastle-on-Tyne Corporation to join in representations urging the Government to introduce legislation requiring the certification and stamping of all electric meters.

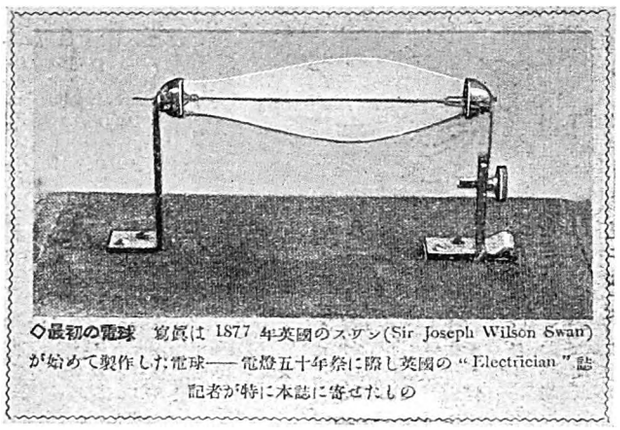
CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Ferro-Concrete Poles.

[To the Editor.]

Sir,—I have read with much interest two articles in your recent issues: (1) by Major Rich (July 26th); (2) by Mr. W. T. Taylor (July 26th and August 9th). Major Rich gives excellent extracts of Mr. Pollack's paper read recently at the Paris Conference—and the discussion. This paper itself is worth reproduction in full in your journal. You also published an abstract of my paper before the Overhead Lines Association on the subject in your issue of May 24th. My verdict was, that ferro-concrete poles—made to the Regulations of the Electricity Commissioners—are uneconomic. Major Rich produces evidence that the Nord Lumiere Co., is convinced that such poles, made to French standards, replace existing wood poles with economy, and have backed that opinion by vigorous action.



◇最初の電球 寫眞は 1877 年英國のスワン(Sir Joseph Wilson Swan)が始めて製作した電球——電燈五十年祭に際し英國の "Electrician" 誌記者が特に本誌に寄せたもの

JAPAN AND THE FIRST ELECTRIC LAMP.

THIS reproduction from "Denkinotomo," the Tokyo electrical journal, of July 15th, 1929, is of particular interest in view of the widespread nature of American propaganda in connection with "Light's Golden Jubilee." Translated, the inscription under the picture reads: "The First Electric Lamp.—The photograph shows the electric lamp bulb made for the first time by Swan (Sir Joseph Wilson Swan) of England in 1877. The photograph was presented to our magazine by courtesy of the Editor of The Electrician, *of England, on the occasion of the 50th anniversary celebration of the first electric lamp.*

Mr. Taylor condemns poles made in a factory, such as those used by the last-named company, and states that the only economic way is to cast the pole, not merely on site but *in situ* vertically. He gives no hint as to whether this is an idea of his, or an accomplished fact. Much of the obscurity in his article would have been avoided if he had compared costs of poles of equal strength, for short, medium and long spans, constructed of the different materials. He gives elaborate tables of costs and comparisons, based upon figures which no one could check—because he does not give the design of pole, nor is it quite clear whether he complies with the Regulations, but in what follows I presume he does so. I challenge his statement that the cost per pole is a wrong basis for comparison. Mr. Taylor cannot claim a monopoly of long span construction for ferro-concrete—or even steel. By using "A" poles one can do it with wood.

Mr. Taylor has introduced so many variables into his comparisons that I feel sure you will excuse me for pointing out that in the absence of full details there would be great possibility of undiscovered error. In any case, I recommend caution in acceptance of the claim made at the end of the paper.

In the first place, the subject of the preservation of timber is not yet closed; the scarcity of good timber suitable for pole work is not so acute as might be thought, owing to the activity in the past half century of the Government Forestry Departments.

On the other hand, all light ferro-concrete work in which any part is subject to tension and vibration is open to suspicion until the effect of time upon it is known. The art of constructing such structures is in its infancy, and I, for one, sympathise with the Electricity Commissioners in their insistence upon a higher factor of safety than for steel structures if the strength of the filling is taken into consideration in the calculation.

In conclusion, I think it only fair to ask whether even one sample pole has been constructed *in situ* vertically, and, if so, have the labour and material costs been kept carefully, and are they available? Moreover, if such pole has been constructed, can we have the figures obtained in tests made upon it, say within three months?

If Mr. Taylor's ideas have not been carried out, and the results are not available, Mr. Taylor's article cannot be said to assist materially in the introduction of ferro-concrete construction for overhead line poles.—I am, etc.,

W. Fennell.

Electricity House, Northwich, Cheshire.
August 10th.

"Light's Golden Jubilee."

[To the Editor.]

Sir,—Col. Morcom's very concise statement of the facts in the Edison *v.* Swan controversy, published in your issue of August 16th, clearly suggests the only graceful way out for our N.E.L.A. friends, viz., to couple with their "Light's Golden Jubilee" celebrations not only the names of Swan and Edison, but also Welsbach, Langmuir and others prominently associated with the development of the electric lamp.

The opportunity presented by a world-wide celebration of one thing—the jubilee of electric light—is too great to be spoiled by disputes of the kind which have so far attended the N.E.L.A.'s efforts. Surely it is not too late, even now, for a modified programme, which will not offend the susceptibilities of other nations, to be devised by those responsible for the American celebration.—I am, etc.,

G. N. Wilsber.

Brighton.
August 19th.

The Electrical Age.

[To the Editor.]

Sir,—We have often talked of the Electrical Age and predicted the date of its arrival. May I suggest, after perusal of the daily papers, that it has now dawned? The first advantage of a certain advertised brand of petrol is its "electric acceleration." A publisher announces a new novel called "Electric Love," and Mr. G. B. Shaw produces a play introducing more officialdom to the electrical industry in the shape of a Powermistress-General. As if that were not enough, the city columns of the popular dailies are full of more or less intelligent and certainly anticipatory forecasts about the attractiveness of electrical shares.—I am, etc.,

"Elecage."

London.
August 20th.

ELECTRIC POWER SYSTEM DEVELOPMENT

(*Concluded from page* 216.)

From this viewpoint it falls short of the star four-wire method, and, the relative maximum voltage to earth for equal line voltage also favours the star method (see *a'* and *a* of Fig. 1). Comparisons are given in this article to show wherein lie the main disadvantages of the delta-connected system.

In a subsequent article, the writer will present a system that: (1) overcomes these and the commonly known disadvantages and, (2) offers those standard system-voltages (shown in the right column of the above table) by means of the common polyphase unit or three single-phase transformers, (3) converts the "Y" and the closed delta systems (respectively) to a symmetrical three-phase four-wire system using one polyphase unit or three single-phase units and providing a true neutral point from the closed delta circuit, (4) converts the delta system without changing any of the existing phase relations.

I see no reason why we should not expect a steady and even growing volume of telegraph traffic, operated telegraphically for the whole or part of its course, provided that we exploit to the full the fundamental advantages of the telegraph as now developed.—*Sir Henry Bunbury.*

NEWS IN BRIEF.

British Electrical and Allied Manufacturers' Dinner—Telephony to Ships in Dock—Ex-German Submarine Cables—Dublin Tramwaymen's Strike.

THE Council of the University of Reading requires a lecturer in physics.

The Association Française de Télévision has been established. M. E. Belin is president, and the Association has offices at 5, Rue Malakoff, Paris.

The annual dinner of the British Electrical and Allied Manufacturers' Association (Incorporated) will take place at the Connaught Rooms, London, on November 20th. Lord Derby, president of the Association, will be in the chair.

The West Gloucestershire Power Co. has opened a second all-electric house at Ryeford, near Stonehouse.

The Treasury has made an order exempting mercury vapour rectifiers from the key industry duty from August 20, 1929, to December 31, 1930.

Electric lighting will be employed at the Rectory Field, Blackheath, London, during the ensuing winter, to enable the local Rugby club to train in the evenings.

The G.W.R. is to provide improved telephone facilities on the Neath and Brecon section, between Gloucester and Swindon, and between Hereford, Gloucester and Worcester.

The provision of telephone facilities between cargo ships in dock and seaport exchanges is suggested by Mr. A. J. Stewart, district manager of telephones in the Newcastle district. Mr. Stewart suggests the use of a special system of plugs along the dockside and flexible telephone cables, complete with receivers, to the ships. In Newcastle and other trading ports, telephones would facilitate the rapid handling of cargoes by putting the ship in instant communication with the company's offices ashore. A canvass of shipowners and dock authorities in the Newcastle district has met with encouraging results.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated August 23rd, 1879 :—*

A telegraph station established at the Ryffel Hotel, under the Ryffelhorn, in the Valais, was the highest in Europe.

Blackpool Corporation decided to light the promenade with six Siemens' lights, "representing 6 000 candle power," at a cost of £2 500.

A writer mentioned that at a Newcastle Chemical Society meeting in December, 1878, Mr. J. W. Swan exhibited an electric lamp "on the incandescence principle."

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of August 26th, 1904, stated that :*

An electric battery-propelled car made a run of 105 miles on one charge.

Revised Board of Trade Regulations under the Electric Lighting Acts permitted a variation of not more than 2½% from the declared frequency.

In his report for 1903, Mr. Scott Ram referred to a case of shock in which the victim had a thumb severed from his hand and the toes of both feet burnt off through his boots. The man was not killed.

* * *

FIFTEEN years ago, it was stated in THE ELECTRICIAN *dated August 21st, 1914, that :*

Glasgow police were being equipped with electric battery lamps.

The "half-watt" lamp was being introduced on the market, but little was known of its performance.

The I.E.E. received over 1 000 replies from members wishing to enrol on its register of engineers available for war service.

* * *

TEN years ago, THE ELECTRICIAN *dated August 22nd, 1919, reported that :*

Many local authorities were buying electric vehicles for dust collection.

E.T.U. members in the Birmingham area were demanding a minimum weekly wage of £6.

It is reported that the Italian Government is desirous of bringing up the question of the final disposal of the cables formerly belonging to Germany, and intends to call a Conference of Ambassadors to settle the matter. Of the ex-German cables in the North Atlantic, Great Britain is in charge of one and France of another, while in the South Atlantic the cable from Liberia to Pernambuco has never been restored.

The new electricity showrooms of the Oldham Corporation Electricity Department in Union Street were officially opened a few days ago, in the presence of a large company of Corporation officials. Ald. Frith, vice-chairman of the Electricity Committee, performed the opening ceremony. The building has a double window frontage, the ground floor being used as a shop and showroom, where a large selection of electrical fittings and appliances are on view. There is also a large lecture room on the ground level.

At the invitation of the authorities of the Shipping, Engineering and Machinery Exhibition, the Association of Supervising Electrical Engineers will pay an official visit to the Exhibition, at Olympia, on September 21st. The programme will include a conference, at which a paper will be given on "Electricity as Applied to Modern Commercial Shipping," by Mr. E. M. Johnson. The Association, in arranging for this paper, has in mind the important developments which are taking place in this connection, and the need for further publicity and education in regard to the matter.

The Hart Accumulator Co., Ltd., welcomed, a few days ago, a party of boys from the Leyton County High School, who were afforded facilities for inspecting the processes of battery manufacture.

The tramway and omnibus services of the Dublin United Tramway Co. were brought to a standstill on Thursday of last week by a strike of employees against a proposed reduction of 10% in wages. No settlement had been reached up to the time when we went to press.

Public telephones in Japan number 2 166, and these produced a revenue of 1 845 500 yen during the past fiscal year. The number is to be increased by 150 during the present year.

The employees of the Tokyo Electric Light Co. recently presented demands, under 23 heads, for improved conditions of employment. The matter was settled without any inconvenience to consumers.

The Board of Education have issued a new list of the more important institutions of technical and art education and other forms of further education recognised by the Board in England and Wales. An indication is given of the approved schemes in operation for national certificates in mechanical and electrical engineering, etc.

In Taunton Corporation's new swimming and slipper baths, which were opened by the Mayor recently, the lighting is electric, electric motors are used in connection with the Paterson filtration plant, etc., and the heating is done by steam from the electricity generating station. No gas or coal is used. At the opening gala the Team Race Shield, presented by the Traders' Association, was easily won by H. H. Morris, E. K. Williamson, B. P. Short and J. M. Glide, members of the electricity department's generating staff.

The prospectus of the Bradford Technical College for the 1929–30 session has been issued by Bradford Education Committee. It contains plans and exterior and interior views of the College buildings, lists of the examiners and teachers, particulars of the conditions of admission, fees, courses of study, awards, scholarships, the electrical and other engineering laboratories, etc.

It was stated in the Edinburgh Burgh Court last week that there is still some doubt among motorists as to whether they may make a left hand turn when an automatic road signal is against them. The regulations in force at Edinburgh state that drivers shall not pass across the white line barrier marked on the street on the near or approach side of the crossing or place until the green or "go" signal is shown.

Shoreditch B.C. has passed a resolution that the attention of the Council be drawn to an allegation that an electricity distributing company had sold its ordinary shares to a foreign undertaking at a huge profit, the Council emphatically protests against the control of public utility undertakings which enjoy statutory monopolies being removed from this country, as it is apprehended that the endeavour to secure the supply of cheap electricity in this country will thereby be defeated. It was further resolved that a copy of the resolution be forwarded to the Minister of Transport and the Electricity Commissioners.

BUSINESS ITEMS.

MR. J. P. MOORES, electrical engineer, of Northwich, has removed to larger premises in Castle Street.

LAWSON'S RADIO STORES have opened new premises at 26, Horsemarket Street and Market at Warrington.

THE indicator board of the totalisator used at the recent Carlisle race meeting. Over 8 000 Osram lamps were employed for signalling runners, pools and dividends.

CRYSELCO, LTD., announces that branches have been opened at 172, Bath Street, Glasgow, with Mr. W. J. Stanley in charge, and 22, Sir Thomas Street, Liverpool, with Mr. K. R. Mackley in charge.

MESSRS. F. W. BLANCHARD, electrical contractors, of 77, Boston Road, West Croydon, have opened up offices and stores at 72B, London Road, West Croydon. This firm was formerly known as F. Blanchard and Son.

A firm of manufacturers' agents in Adelaide desires to represent, on a commission basis, British manufacturers of electrical equipment and apparatus, etc. Further particulars from the Department of Overseas Trade. (Reference No. 528.)

A firm of manufacturers' agents in Sydney (N.S.W.) desire to obtain the representation in New South Wales and Victoria of British manufacturers of electric drills and small tools, factory plant, etc. Further particulars from the Department of Overseas Trade. (Reference No. 184.)

SELECTORS, LTD., have transferred their offices from London to 206–207, Bedford Avenue, Slough Trading Estate, Slough, Bucks, and they ask that correspondence be sent to that address. For the convenience of London clients they are keeping a small stock at the London depot, 1, Dover Street, Piccadilly, W.1, where urgent orders can be executed.

Subject to ratification by WIRELESS PICTURES, LTD., AMALGAMATED WIRELESS (AUSTRALASIA), LTD., have concluded with WILLIAM BLOGG AND CO., LTD., the Fultograph agents in Australia, a five years' contract for a still-picture service. Transmissions from Melbourne are expected to begin shortly. Both 3LO and 2FC (Sydney) on 31·28 metres are well heard in this country.

A few years ago the "Bayer" mechanical soot blower was put on this market by the LOVICK JOHNSON CO. The volume of contracts in hand and projected has made a separate organisation essential and the manufacture of the whole of the equipment is now carried out in England, and the business for Great Britain, Europe, India and Africa, will in future be dealt with by the BAYER SOOT BLOWER CO., LTD., of 125, Balham High Road, London, S.W.12. The reorganisation embraces the existing personnel and the management remains under the same direction.

The staffs of Strange and Sons, electrical engineers, Tunbridge Wells, Sevenoaks, Cranbrook, and Heathfield, had their annual outing on August 10th, when they journeyed by road to Margate.

COOKING ON TRAINS.

New Trains with All-electric Restaurant Cars for L.N.E.R. Services.

THE London and North Eastern Railway, which operates sixteen all-electric kitchens, equipped with full cooking ranges and refrigerators, on the east coast services to Scotland and the West Riding, Marylebone-Manchester services, and on the Liverpool Street-Parkeston Quay Continental boat expresses, has introduced electrically operated restaurant cars on its Liverpool Street-Cromer and Liverpool Street-Yarmouth services.

The L.N.E.R. was the first to introduce electric cooking on trains, *i.e.*, on the London-Leeds service in 1921; in 1924, articulated restaurant car sets (whereby three vehicles are carried on four bogies) were added to the "Flying Scotsman" expresses; the weight of these electric restaurant car sets is 83 tons, and they enable 78 passengers to be served simultaneously. A brief description of the cooking apparatus in the electric kitchen is of interest, in view of the novelty of the application, the credit of which is due to the enterprise of the Chief Mechanical Engineer of the L.N.E.R., Mr. H. N. Gresley, under whose personal supervision the work has been carried out.

The whole of the apparatus has been supplied by Messrs. J. Stone and Co., of Deptford, London, whose system of electric lighting is also fitted throughout the train. Current is supplied both by accumulators, which are mainly used when the train is standing still, and by two dynamos carried on the under frame of the car. The latter are each of 7·2 kW capacity, with self-contained automatic pole changers, and are driven by means of belts from the axles of the carriages. The main cooking range is fitted across one end of the kitchen, and on the left are the roasting and steaming ovens and grill, with hot water tank superimposed. On the right are the boiling range, with six hotplates for frying, boiling, heating sauces, etc., and one boiling pan of 7 gallons capacity for cooking vegetables, etc. Between the serving hatches is fitted a heated cupboard which will take the whole of the plates required for the service, and the top forms a convenient table. Two urns and two six-pint kettles are available for boiling water for teas, and to supplement the supply from the boiler on top of the oven range. There are also two 45-gallon tanks for warm water fitted in the roof of the corridor just outside the kitchen. Electrically-heated elements are fastened on the underside of these tanks, which are connected with the boiler on top of the oven range. A continuous supply of boiling water for washing up and other purposes is thus ensured, as the water is partially heated in the roof before it is brought to boiling point in the boiler.

The control of the cooking equipment in the kitchen is arranged as conveniently as possible for the chef. Pilot lamps are set over the switches, illuminating red glasses inscribed with the name of the apparatus in use, so that, at a glance, an indication is obtained of the different operations that are going on.

An experimental "Frigidaire" plant has been installed by the Delco Light Co. on several of the cars, to ensure a constant supply of ice cubes in all weathers. It is operated by a compressor beneath the car.

AUSTRALIAN ELECTRICITY ACCOUNTS.

The accounts of the Sydney (N.S.W.) electricity undertaking for 1928 show that the revenue was £2 249 796, against £2 135 780 in the preceding year, and the net loss after provision for working and general expenses and capital charges, was £33 737, against £22 038. Total cost (including capital charges) per kWh sold was 1·82d., against 1·86d., and the average price received was 1·72d. Electricity generated at the Pyrmont power station was 223 097 700 kWh, and purchased from the Railways and Tramways Department 140 717 100 kWh. Total load connected was equal to 7 482 442 60 W lamps, an increase of 15·57 %. Motors connected amounted to 181 699 H.P. The work of demonstrating and selling electrical appliances for domestic use was continued from a central showroom at headquarters, as well as from motor vehicles visiting the premises of consumers, as was also the work of repairing electrical appliances for consumers free of charge, except in cases in which any material was required, when the cost of the material only was charged. During the year, electrical appliances were sold to the value of £42 500.

PERSONAL.

MISS Jessie MacLeod has been appointed assistant in the Welfare Department of Siemens Brothers, Ltd.

Mr. S. Hartland, assistant mains engineer at the Gillingham (Kent) municipal electricity works, has resigned.

Mr. C. A. Vandervell secured second prize in the Berkshire clean milk competitions, in respect of Manor Farm, Tidmarsh.

Sir Hugo Hirst was a prize-winner at the Twyford and Ruscombe Horticultural Show last week. He secured five awards.

Shrewsbury T.C. has increased the salary of Mr. C. M. Johnstone, engineer and manager, from £600 to £700 per annum.

Sleaford U.D.C. has granted a sum of £50 to Mr. W. H. Wilson, chief engineer, in consideration of extra services rendered.

Eastbourne Electricity Committee has appointed Mr. D. W. A. Roberts as deputy borough electrical engineer, at a salary of £559 per annum.

Mr. J. T. Jones, of Manchester electricity department, has been appointed electrical engineer and manager to the Gelligaer Council.

Coun. J. Hanson has resigned the chairmanship of Rochdale Electricity Committee, and Coun. L. W. Taylor has been appointed as his successor.

Mr. H. W. Young, president of the Delta-Star Electric Co., of Chicago, has returned to the States, following his tour of Germany, France, and England.

The marriage of Mr. William A. Parker, borough electrical engineer, Workington, and Miss Nellie Cusack, was solemnised on August 12th, at Workington.

Mr. J. B. Feltham, electrical engineer and manager of the Mexborough Electricity Department, was the winner of a £500 prize in a newspaper crossword puzzle competition.

Mr. George Dixon, engineer to the electricity undertaking of the Skelton and Brotton U.D.C., has accepted a position with the Cleveland and Durham Electric Power Co.

Dumfries T.C. has appointed Mr. A. E. Roots, chief assistant engineer at the Worcester electricity works, as manager and engineer of the Dumfries electricity undertaking. There were 64 applicants for the post.

Mr. R. S. Irwin, engineer and manager of the Clones Electricity Co., has been appointed engineer and manager in connection with the electricity scheme of Bangor (Northern Ireland, T.C., at a salary of £350 per annum.

Mr. W. C. Lusk has been appointed chairman of the British Thomson-Houston Co., Ltd., and deputy chairman of Associated Electrical Industries, Ltd. He is resigning the position of managing director of the B.T.H. Co. See page 235.

Mr. A. E. Halliwell, late engineer in the Marine Department of Foster, Wheeler, Ltd., has taken up duties as director and engineer with Phillips and Sons (Chiswick), Ltd., manufacturing electrical and mechanical engineers, 42, Waterford Road, Walham Green.

Mr. V. Dempsey has been transferred, under the Electricity Supply Board, from Bray generating station, where he was assistant engineer, to Carlow station as charge engineer. The occasion of his transfer was marked by a presentation from the Bray station staff.

A marriage has been arranged between Mr. Horace Courtlandt Dawson, younger son of Sir Philip and Lady Dawson, and Miss Ellaline Saunders, daughter of Mr. and Mrs. B. B. Saunders, of Bank House, Ely, and will be solemnised at St. Mary's Church, Ely, on September 14th.

Among those attending a recent conference of manufacturers of canteen equipment, with a view to providing the most effective equipment to meet the needs resulting from the setting up of canteens in large firms was Mr. Assheton Taylor, of the refrigerator department of Electrolux, Ltd.

Mr. H. D. Phelps, who has been resident engineer at Thirsk for the Northern Counties Electricity Supply Co., Ltd., for the Thirsk and Malton districts since 1923, has been presented with an oak chiming clock, on the occasion of his leaving Thirsk to join the headquarters staff at Newcastle.

Douglas Electricity Committee recommends increases of the salaries of Mr. Bertram Kelly, borough electrical engineer, from £600 to £675 per annum. Mr. P. Bregazzi, assistant engineer and mains superintendent, from £320 to £370, and Mr. R. M Clague, station superintendent, from £350 to £370.

Biographical notes on Mr. G. R. Bateman, publicity manager of Standard Telephones and Cables, Ltd., and Mr. J. Taffs, advertising manager of the English Electric Co., Ltd., were included in a recent "Who's Who in the Incorporated Society of British Advertisers," published in the "World's Press News."

The following Post Office appointments are announced: Mr. M. C. Pink, assistant controller of the London Telephone Service, to be deputy controller; Mr. H. Diver, superintendent, to be assistant controller; Mr. G. T. Archibald, Inspector of Telegraph Traffic, to be assistant controller of Central Telegraph Office.

The marriage was solemnised at Sherborne Abbey, on August 14th, of Mr. Joseph Jacob Davis, managing director of the Express Magneto Co., Ltd., of Yeovil, and Miss Muriel Mary Elliott. The bridegroom received from the company's staff an amber cut-glass table centre-piece and trinket set, and from Petters, Ltd., a set of silver candlesticks.

Mrs. J. Tyler is relinquishing her position as honorary secretary of the South Wales and Monmouthshire branch of the Electrical Association for Women, and Mrs. Snow is succeeding her. Mrs. Tyler, who organised the branch about three years ago, will remain a member of the committee. She has returned to her duties with the South Wales Power Co., after a recent illness.

Mr. Bruce Kelly has recently been appointed to the position of manager of the electrical branch of A. S. Patterson and Co., Ltd., of New Zealand. Mr. Kelly received part of his training at the Witton works of the General Electric Co., and subsequently became attached to the London office of Asea Electric, Ltd. In 1927 Mr. Kelly became assistant engineer to the export department of the company, and returned to New Zealand last March.

The Marconiphone Co. announces the appointment of Mr. I. H. Williams as sales manager. Mr. Williams first joined the company in 1922, and acted as assistant branch manager at Manchester. Later, he returned to London as sales representative for the South Eastern Counties, assuming the duties of assistant London manager in 1926. At the end of 1928 he became assistant sales manager. His wide experience of the radio trade will undoubtedly prove of great value in his new appointment. See page 233.

The vacancies which will occur in the Council of the Institution of Electrical Engineers on September 30th will be filled by Col. Sir T. F. Purves, O.B.E., who has been elected president; Mr. E. Welbourn, vice-president; Mr. E. Leete, hon. treasurer; Mr. A. R. Cooper, Mr. R. S. Whipple and Prof. E. Wilson, ordinary members of Council; and Mr. E. E. Sharp, associate member of Council. Sir Thomas F. Purves has been engineer-in-chief of the Post Office since 1922. He was engaged at the G.P.O. in Edinburgh until 1895, and has since been occupied in important work in the engineer-in-chief's department in London. His knighthood, which was announced in the last New Year's Honours list, was granted in recognition of his services to the Post Office. See page 233.

The presentation of the first Benjamin G. Lamme medal to Mr. Allen Bertram Field, one of the engineers of the Metropolitan-Vickers Electrical Co., was made recently at Swampscott, Mass., U.S.A., the proceedings being broadcast by the short wave transmitter of station KDKA, Pittsburg. The Lamme medal was created by provisions in the will of the late Mr. Benjamin G. Lamme, chief engineer of the Westinghouse Electric and Manufacturing Co., and is given for meritorious achievement in the design of electrical machinery. The specific accomplishment for which Mr. Field was awarded the medal was "the mathematical and experimental investigation of eddy current losses in large slot-wound conductors in electrical machinery."

Obituary.

MR. J. STUART BEDDOE, superintendent of the Dockyard Department of the Admiralty, at Swansea, last week. Mr. Beddoe was an associate member of the Institution of Electrical Engineers.

MR. ARMISTEAD K. BAYLOR, commercial engineer with the American General Electric Co., aged 61 years. In 1896 he came to England to manage the traction department of the British Thomson-Houston Co. He left, after fourteen years, to join the American G.E. Co. He had been a member of the Institution of Electrical Engineers since 1898.

MR. THOMAS HENRY LAWSON, on August 9th, aged 53 years. He was in partnership with Mr. Pascoe in the firm of Lawton and Pascoe, electricians, of Douglas, Isle of Man, and was engaged repairing the electrical installation on the "King Orry," which was lying alongside the Victoria Pier. The work was finished about midnight on August 8th, and he was proceeding to the shore over a gangway composed of two planks, when he fell into the water, and his body was recovered the next morning. Prior to establishing his own business he was for a number of years with the Manx Electric Railway Co

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

BLACKPOOL CORPORATION.—Twelve months' supply of electricity meters. Particulars from the borough electrical engineer, Mr. C. Furness.

PORTSMOUTH CORPORATION.—Supply and installation of armourclad, e.h.t. switchgear to control alternators, feeders and station auxiliaries. Specifications, etc., from Mr. B. Handley, Electricity Works, Portsmouth; deposit £2.

MANCHESTER CORPORATION, August 23rd.—Supply of steel tramway poles. Specifications, etc., from the General Manager, 55, Piccadilly, Manchester.

CENTRAL ELECTRICITY BOARD, August 24th.—Supply, delivery, and erection of metering equipment for certain stations in the area of the South-East England Electricity Scheme, 1927. Specification No. S.E.E.-G.M.1 from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit, £2 2s. for first copy, £1 1s. for each subsequent copy.

NEWCASTLE ENDOWED SCHOOLS, August 24th.—Electric light installation in a new wing to be erected at each of two schools, viz.: Newcastle-under-Lyme High School, and Newcastle-under-Lyme Orme Girls' School. Specifications, etc., from Messrs. Cramp and Frith, 1, Dickinson Street, Manchester; deposit £3 3s. in respect of one contract, or £6 6s. in respect of both contracts. Tenders are invited only from firms on the National Register of Electrical Installation Contractors.

BURTON LATIMER URBAN DISTRICT COUNCIL, August 26th.—Electric light wiring of 44 houses on the Station Road estate. Tenders to the Clerk.

COMMITTEE OF VISITORS OF GLOUCESTERSHIRE MENTAL HOSPITALS, August 26th.—Electric wiring of Wotton and Coney Hill Mental Hospitals, on "Stannos" earthed concentric system. Specification, etc., from Messrs. Handcock and Dykes, 11, Victoria Street, Westminster, S.W.1; deposit £2 2s.

WEST HAM EDUCATION COMMITTEE, August 26th.—September 16th.—Installation of electric light apparatus at Plaistow Secondary School. Specification, etc., from Mr. J. H. Jacques, 61, West Ham Lane, Stratford, London, E.15, until August 26th; deposit £1. Tenders by September 16th.

BRIGHTON GUARDIANS, August 27th.—Electric lighting equipment in Nurses' Home, Poor Law Infirmary, Pankhurst Avenue, Brighton. Specification, etc., from the Clerk, Prince's Street, Brighton.

POPLAR (LONDON) BOARD OF GUARDIANS, August 28th.—Supply and installation of e.h.t. switchgear, a 75 kW mercury arc rectifier, and l.t. d.c. switchboard at the Institution. Specification, etc., from Mr. G. Butler, clerk, 45, Upper North Street, Poplar, London, E.14; deposit £2 2s. returnable.

WESTMINSTER GUARDIANS, August 28th.—Electric lamps, fittings, etc. Forms of tender from the Clerk, Princes Row, London, S.W.1; stamped, addressed envelope to be sent.

STAPLEFORD RURAL DISTRICT COUNCIL, August 29th.—Electrical pumping stations, etc., in connection with Chilwell and District sewerage works. Specifications from Elliott and Brown, Burton Buildings, Parliament Street, Nottingham; deposit £3 3s.

Alternating Current Meters.

ALDERLEY EDGE AND WILMSLOW ELECTRICITY BOARD, August 30th.—Supply of 2 200 a.c. house service electricity meters. Particulars from Mr. E. Hesketh, Electricity Works, Alderley Edge.

MANCHESTER CORPORATION, August 30th.—Supply and delivery of one water-tube boiler superheater, for Barton power station. Continuous actual evaporation of boiler, 130 000 lb. of water per hour. Specification, etc., from Mr. H. C. Lamb, chief engineer and manager, Electricity Department, Town Hall, Manchester.

PLYMOUTH CORPORATION, August 30th.—Electrician's ironmongery, etc. Forms of tender from Mr. R. J. Fittall, town clerk.

WEST RIDING EDUCATION COMMITTEE, August 30th.—Electric light installation at Highfields School, Doncaster. Particulars from the divisional clerk, Mr. A. J. Dempster, 20, Christ Church Road, Doncaster.

BURY AND DISTRICT JOINT HOSPITAL BOARD, August 31st.—Supply, delivery and installation of electric refrigerator at (1) Florence Nightingale Hospital, Bury; and (2) Aitken Sanatorium, Holcombe. Specifications, etc., from Mr. F. Wild, clerk, 2, Cross Street, Bury.

WARRINGTON WATER COMMITTEE, August 31st.—Supply of electrically-driven centrifugal pumping plant. Forms of tender, etc., from Mr. J. Gray, water engineer, Warrington; deposit £2 2s.

STOKE-ON-TRENT CORPORATION, September 2nd.—Electric services to new ward and garage at Bucknall Infectious Diseases Hospital. Specification, etc., from the City Electrical Engineer; deposit £2.

Annual Supplies of Cables, etc.

WARRINGTON CORPORATION, September 2nd.—Twelve months' supply of (1) e.h.t. and l.t. paper and lead-covered cables; (2) earthenware conduits; (3) reinforced concrete cable protector slabs and tiles, and hard burned red tiles. Specifications (deposit £1 1s. for each) from Mr. F. V. L. Mathias, Electricity Works, Warrington.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, September 4th.—Extension of extra high pressure switchgear (contract No. 52). Specifications, etc., from Mr. R. W. Willis, 37, High Street, Cheadle, Cheshire; deposit £1 1s.

EPSOM GUARDIANS, September 4th.—Electric light installation at the institution. Particulars from the clerk, Mr. Alick G. Ebbutt, Mead House, 61, South Street, Epsom.

WOOLWICH GUARDIANS, September 4th.—Refrigerating plant. Further particulars from the Steward at the Hospital, Plumstead High Street, London, S.E.18.

STEPNEY (LONDON) GUARDIANS, September 5th.—Six months' supply of electrical fittings, etc. Forms of tender from Mr. S. McClelland, Administrative Offices, Bancroft Road, Mile End, E.1; stamped, addressed envelope to be sent.

HARROGATE CORPORATION, September 7th.—Supply and erection of overhead 11 000 V lines and 346/200 V lines. Specification, etc., from Mr. Neil McLean, borough electrical engineer, 33, Swan Road, Harrogate.

SCARBOROUGH CORPORATION, September 7th.—Supply and erection of e.h.t. and l.t. overhead lines (spec. 8/29); and supply of e.h.t. and l.t. paper insulated cable (spec. 9/29). Specifications, etc., from Mr. E. J. Jarvis, 89, Westborough, Scarborough.

LONDON COUNTY COUNCIL, September 9th.—Supply and erection of e.h.t. switchgear, etc., for tramway sub-stations. Specifications, etc., from the General Manager of Tramways, 23, Belvedere Road, S.E.1; deposit £2.

NEW MILLS URBAN DISTRICT COUNCIL, September 9th.—Electrical equipments, including e.h.t. and l.t. switchgear, transformers, transformer kiosk, e.h.t. and l.t. cables, feeder pillars, etc. Specification, etc., from the clerk, Mr. D. Bennett.

OLDHAM GUARDIANS, September 9th.—Electrical lamps and fittings. Particulars from the clerk, Mr. F. W. Fletcher.

LIVERPOOL CORPORATION, September 10th.—Electric power and lighting installation for new abattoir, Stanley, Liverpool. Specification, etc., from Land Steward and Surveyor, Municipal Buildings, Liverpool; deposit £3 3s.

CENTRAL ELECTRICITY BOARD, September 11th.—Supply, delivery and erection of 132 kV overhead transmission lines (approach to Clarence Dock, Liverpool). Specification No. N.W.E.-P.L.3, from Mr. R. H. Fox, secretary, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s., for first copy, and £1 1s. for each subsequent copy.

CROYDON GUARDIANS, September 11th.—Six months' supply of electrical fittings and appliances, etc. Forms of tender from the Clerk, Mayday Road, Thornton Heath; stamped addressed envelope to be sent.

EAST LOTHIAN EDUCATION AUTHORITY, September 27th.—Electrical work in connection with erection of public schools at Longniddry and Aberlady. Forms of tender, etc., from Messrs. Morham and Brotchie, 29, Hanover Street, Edinburgh.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—Three 125 000 lb. per hour normal (150 000 lb. per hour maximum) steam generating units, water tube boilers, with stokers, economisers, coal and ash handling equipment, etc.

Digitized by Google

with foundations and boiler house buildings. Specification, etc., from the Borough Electrical Engineer, 18-24, Lower Clapton Road, London, E.5; deposit £3.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—One 30 000 kW C.M.R. turbo-alternator and exciter, etc. Specifications from the Borough Electrical Engineer, 18–24, Lower Clapton Road, E.5; deposit £30.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—Fourteen 6 600 V, three-phase, metal clad, oil circuit breaker equipments, each not less than 1 000 000 V rupturing capacity; remote electrically-controlled, duplicate busbars; cabling and auxiliary gear controlling one 30 000 kW turbo-alternator, two 30 000 kVA transformers, two 15 000 kW reactance links, one 30 000 kVA busbar coupler equipment, with and without reactance, and six 8 000 kW feeders. Specifications from the Borough Electrical Engineer, 18–24, Lower Clapton Road, E.5; deposit £3.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

BELGIAN POSTS AND TELEGRAPHS, August 26th.—Telephone cables between Ghent and Antwerp, Liege and Combain-au-Pont, Verviers and Francorchamps, and Charleroi and Liege. Cahier des Charges (fr. 6¼) from the Post and Telegraph Department, Brussels.

GREY ELECTRIC POWER BOARD, August 27th.—Supply and erection of generating plant, for the Arnold river hydro-electric scheme. (Reference B.X. 5 422.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, August 27th.—Supply of cord type switchboards (schedule C. 448). (Reference B.X. 5 428.)

INDIAN STORES DEPARTMENT, August 28th.—One 30 kW two-wire d.c. generating set. (Reference B.X. 5 522.)

JOHANNESBURG MUNICIPALITY, August 29th.—Supply of two miles of 0000 S.W.G. (4 in. diameter) round section, h.d. copper trolley wire (contract No. 236). (Reference A.X. 8 345.)

JOHANNESBURG MUNICIPALITY, August 29th.—Copper weatherproof wire for overhead lines. (Contract No. 234.) (Reference B.X. 5 565.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, August 29th.—Supply of 3 000 lamp fittings. (Reference B.X. 5 534.)

COMPAGNIE DES CHEMINS DE FER PORTUGAIS, August 31st.—Mechanical or electrical apparatus for operating points and signals. (Reference A.X. 8 367.)

CARLOW DISTRICT MENTAL HOSPITAL, August 30th.—Electric wiring in the principal mental hospital, Kelvingrove. Specification, etc., from Messrs. MacEntee and O'Kelly, 23, Upper O'Connell Street, Dublin; deposit £2 2s.

WATERFORD HARBOUR COMMISSIONERS, August 31st.—Light standards, poles, cables, lamps, etc. Specification, etc., from the Harbour Engineer; deposit £2 2s.

PRETORIA CORPORATION, September 2nd.—Columns, fittings, lanterns, etc., for street lighting, and master clock for frequency regulation. (Reference A.X. 8 322.)

DUBLIN PORT AND DOCKS BOARD, September 3rd.—Supply and erection of two 4-ton level luffing electric portal cranes. Specifications from the engineer of the board, Mr. J. Mallagh, East Wall, Dublin.

OUDTSHOORN MUNICIPALITY, SOUTH AFRICA, September 3rd.—Supply and delivery of 35 kW steam-driven generating set, together with the supply and delivery only of certain switchgear material. (Reference B.X. 5 524.)

CAPE TOWN MUNICIPALITY, September 4th.—Steel poles, insulators, street lighting fittings, etc. (Reference A.X. 8 334).

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 7th.—Supply of v.i.r. wire. (No. P. and T. 151/1 573.) (Reference B.X. 5 416.)

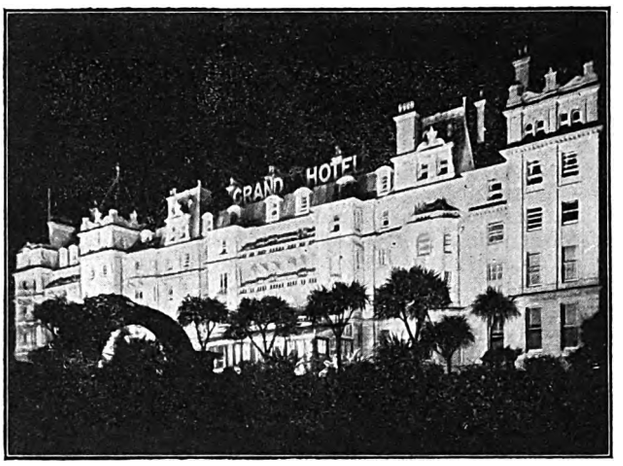
MAFEKING MUNICIPALITY, September 9th.—Steam raising plant, engines, alternators, switchgear, etc. (Contract "A.") (Reference A.X. 8 352.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 10th.—Two-conductor cores (P. and T. 151/1 600). (Reference B.X. 5 462.)

LOURENÇO MARQUES PORT AND RAILWAYS, September 11th.—Battery tractors and trailers. (Reference A.X. 8 172.)

BULAWAYO MUNICIPALITY, September 13th.—Supply of h.t. overhead transmission lines, stepdown transformers, pumps with motors, etc. (Reference A.X. 8 181.)

AUCKLAND (N.Z.) ELECTRIC POWER BOARD, September 16th.—Supply of automatic sub-station at Remuera (two 500 kW machines and switchgear); automatic sub-station at Point Chevalier (two 1 000 kW machines and switchgear);



THE Grand Hotel, Torquay, the façade of which is illuminated by B.T.H. coloured floodlighting. The projectors are arranged in two groups fixed at ground level, 45 ft. in front of the building, one group being trained at the lower half of the building and the other on the upper portion. The projectors are equipped with 1 000 W gasfilled lamps, and are provided with screens of flame colour.

22 000 V switchgear; 6 600 V switchgear; and supervisory control apparatus. (Reference B.X. 5 506.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, September 17th.—Supply and erection of petrol-electric sets. (Reference B.X. 5 537.)

SOUTH INDIAN RAILWAY CO., LTD., September 20th.—Supply of electric goods, locomotives and battery tenders, in connection with electrification of Madras suburban services. Specifications, etc. (£1) from the company's offices, 91, Petty France, Westminster, S.W.1.

SOUTH INDIAN RAILWAY CO., LTD., September 20th.—Electrical control and traction equipment for suburban services. Specifications, etc. (£1, not returnable), from the Company's Offices, 91, Petty France, Westminster, S.W.1.

EGYPTIAN MINISTRY OF THE INTERIOR, September 23rd.—Electric light installation and distribution system for the town of Kafr-el-Cheikh (Gharbick Province). (Reference B.X. 5 502.)

INVERCARGILL (N.Z.) CORPORATION, September 23rd.—Supply and delivery of switchboard, to be directly operated and suitable for controlling 11 000 V, three-phase, 50-cycle current, it may be either of the draw-out truck type or totally armour clad, and will at first consist of seven units. (Reference B.X. 5 507.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 23rd.—Crude oil engine-driven 150 kW electric generating plant. (Tender No. 1 528.) (Reference B.X. 5 566.)

Condensers Required for Australia.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, September 24th.—Supply of condensers (schedule C. 461). (Reference B.X. 5 488.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 26th.—Two 100 kVA motor-alternators (tender No. 1 521). (Reference B.X. 5 564.)

DURBAN CORPORATION, September 27th.—Supply of three-phase ironclad, compound filled switch panels (specification S. 778). (Reference B.X. 5 505.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 28th.—Machine tools, Diesel and semi-Diesel engines, boilers, electric batteries, etc., for the Prisons Administration. (Reference A.X. 8 245.)

MARLBOROUGH (N.Z.) ELECTRIC POWER BOARD, September 28th.—Supply and erection of 600 B.H.P. Diesel driven generating plant and switchgear. (Reference B.X. 5 556.)

Digitized by Google

STATE ELECTRICITY COMMISSION, VICTORIA, September 30th.—Supply and delivery of three 3 000 kVA 50 cycle, oil immersed, self-cooled, outdoor type single-phase transformers and spare coils and bushings. (Reference B.X. 5 523.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 30th.—Twelve months' supply of electric lamps (tender No. 1 526). (Reference B.X. 5 590.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Three 3 000 kVA transformers and spares. (Reference B.X. 5 523.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply, erection and maintenance of coal conveying plant. Specification (No. 29/68) from the Agent-General, Victoria House, Strand, London, W.C.; deposit £2 2s.

WELLINGTON CORPORATION, September 30th.—Electric motors, starters and switchgear, for the Milk Department. (Reference B.X. 5 508.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 1st.—Erection and equipment of electric power station (about 500 kVA), with overhead and underground networks, for the town of Menouf. (Reference B.X. 5 567.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, October 1st.—Supply of electric lamp standards. (Reference A.X. 8 251.)

POSTS AND TELEGRAPHS DEPARTMENT, MELBOURNE, October 1st.—Supply and delivery of switchboard cords. (Reference B.X. 5 515.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 1st.—Supply of bolts, brackets, screws, springs, etc., for British Post Office No. 121 wall telephones and No. 2 receiver switch. (Tender No. P. and T., 151/1700).

VICTORIAN RAILWAY COMMISSION, October 2nd.—Supply of a.c. line relays for power signalling. (Reference B.X. 5 563.)

MONTEVIDEO PORT ADMINISTRATION, October 7th.—Electric trucks, for load of 1 500 to 2 000 kilos, with generating sets for charging batteries, etc. (Reference A.X. 8 353.)

VICTORIAN ELECTRICITY COMMISSION, October 7th.—Supply and delivery of 11 000 V three-core cable. (Reference B.X. 5 539.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 15th.—Supply of B.P.O. type resistances. (No. P. and T., 151/1712).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 15th.—Seven 5 500 kVA single-phase auto-transformers, with accessories, for Waitaki power scheme. (Reference B.X. 5 417.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 15th.—Switchboard instruments, test plugs and sleeves (schedule C. 472). (Reference B.X. 5 541).

WELLINGTON POSTS AND TELEGRAPHS DEPARTMENT, October 15th.—Supply and delivery of B.P.O. type resistances. (Reference B.X. 5 551.)

WELLINGTON POSTS AND TELEGRAPHS DEPARTMENT, October 15th.—Supply and delivery of B.P.O. type retardation coils. (Reference B.X. 5 552.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 16th.—Electric motors, pumps, filters, and artesian well. (Reference A.X. 8 373.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 16th.—Automatic wall and table telephones. (Reference B.X. 5 509.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Supply of insulated wire (schedule C.475). (Reference B.X. 5 580.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Telephone transformers (schedule C.474). (Reference B.X. 5 581.)

MELBOURNE CITY COUNCIL, October 30th.—Two 2 500 kW motor-convertors and accessories, or two 2 500 kW rotary convertors, with transformers and accessories. (Reference B.X. 5 570.)

WESTERN AUSTRALIA GOVERNMENT, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General, Savoy House, Strand, London, W.C.2.

Tenders Accepted.

SLOUGH URBAN DISTRICT COUNCIL.—W. G. Bedford, rewiring work at Chalvey pumping station, £26 5s.

KNIGHTON URBAN DISTRICT COUNCIL.—Knighton Electric Light Co., public lighting during winter season, £173.

EVESHAM RURAL DISTRICT COUNCIL.—H. Parker, electric light installation in 52 houses at Broadway, £215 8s.

SEAHAM HARBOUR URBAN DISTRICT COUNCIL.—Favell and Co., extension of lighting cables to Carr House estate, £365 14s.

STOKE-ON-TRENT CORPORATION.—Messrs. Barnett and Soans, wiring for lighting and motors at the Central power house, £971 7s.

NORTHAMPTON CORPORATION.—Northampton Electric Light and Power Co., Ltd., provision of mains and lighting for the refuse disposal plant, £640.

ISLINGTON (LONDON) BOROUGH COUNCIL.—Tudor Accumulator Co., repairs to and replacement of emergency lighting battery at electricity station, £461.

MANCHESTER SOUTH JUNCTION AND ALTRINCHAM RAILWAY.—Metropolitan-Cammell Carriage, Wagon and Finance Co., Ltd., 24 motor cars, 22 trailer cars and 22 driving trailer cars. The contract amounts to nearly £200 000.

SOUTHEND CORPORATION.—General Electric Co., Ltd., supply of 1 500 kW motor-generator, £5 483; Westinghouse Brake and Saxby Signal Co., Ltd., signalling apparatus, for use on pier tramway, £960. (Both recommended.)

Switchgear for National Scheme.

CENTRAL ELECTRICITY BOARD.—English Electric Co., Ltd., 33 kV metal clad switchgear for the North West England Electricity Scheme. The contract, which is of the value of over £80 000, covers 39 metal-clad units, of which 29 are Class O.L.F. with a rupturing capacity of 500 000 kVA, and 10 Class O.L.G. having a rupturing capacity of 750 000 kVA. All units have duplicate busbars with plug changing, and are electrically operated from a remote control board. The contract is a comprehensive one, and includes protective gear, control boards, cabling, batteries, handling gear, l.t. auxiliary switchgear, etc. It will be remembered that an order for 33 000 V transformers for this scheme was also placed with the English Electric Co.

LONDON COUNTY COUNCIL.—Hurst, Nelson and Co., Ltd., 100 double-deck electric tramcar bodies (class E. 3 bogie type), £172 200. Also tendered: English Electric Co., Ltd., £173 200; Brush Electrical Engineering Co., Ltd., £173 200; R. Y. Pickering and Co., Ltd., £180 600; Metropolitan-Cammell Carriage, Wagon and Finance Co., Ltd., £181 100; Cravens Railway Carriage and Wagon Co., Ltd., £183 100; Short Brothers (Rochester and Bedford), Ltd., £186 100; W. and E. Hill, Ltd., £250 200. English Electric Co., Ltd., 50 double-deck electric tramcar bodies (class H.R. 2 bogie type), £87 400. Also tendered: Brush Electrical Engineering Co., Ltd., £87 900; Hurst, Nelson and Co., Ltd., £88 400; Metropolitan-Cammell Carriage, Wagon and Finance Co., Ltd., £92 050; R. Y. Pickering and Co., Ltd., £92 550; Cravens Railway Carriage and Wagon Co., Ltd., £93 300; Short Brothers (Rochester and Bedford), Ltd., £93 550; W. and E. Hill, Ltd., £125 650. Electro-Mechanical Brake Co., Ltd., 100 complete tramcar sets of class 4 centre-bearing swing bolster bogie trucks, £24 900. Also tendered: Kilmarnock Engineering Co., Ltd., £28 675; English Electric Co., Ltd., £28 675; Maley and Taunton, Ltd., £28 800; Brush Electrical Engineering Co., Ltd., £29 830; Cravens Railway Carriage and Wagon Co., Ltd., £30 500; Malleable Steel Castings Company (1909), Ltd., £32 400; Hurst, Nelson and Co., Ltd., £33 400. Electro-Mechanical Brake Co., Ltd., 50 complete tramcar sets of class 6 centre-bearing swing bolster bogie trucks, £15 600. Also tendered: Kilmarnock Engineering Co., Ltd., £16 548 15s.; English Electric Co., Ltd., £16 698 15s.; Maley and Taunton, Ltd., £17 350; Cravens Railway Carriage and Wagon Co., Ltd., £18 500; Malleable Steel Castings Co. (1909), Ltd., £19 850; Hurst, Nelson and Co., Ltd., £19 950; Brush Electrical Engineering Co., Ltd., £22 350. English Electric Co., Ltd., 100 complete tramcar sets of electrical equipments for class E.3 cars, and assembly and connecting up of 100 class E.3 car bodies with trucks, brakes and electrical equipments, etc., £83 750. Also tendered: Metropolitan-Vickers Electrical Co., Ltd., £83 950; General Electric Co., Ltd., £86 350; British Thomson-Houston Co., Ltd., £88 150. Metropolitan-Vickers Electrical Co., Ltd., 50 complete tramcar sets of electrical equipments for class H.R. 2 cars, and assembly and connecting up of 50 class H.R. 2 car bodies, with brakes, trucks and electrical equipments, etc., £60 000. Also tendered: English Electric Co., Ltd., £63 450; General Electric Co., Ltd., £63 700; British Thomson-Houston Co., Ltd., £65 950. Estler Bros., Ltd., sets of magnetic track and wheel brake equipments for 100 class E. 3-bogie tramcars and 50 class H.R. 2-bogie tramcars, £8 152 10s. Also tendered: Malleable Steel Castings Co. (1909), Ltd., £9 875; Metropolitan-Vickers Electrical Co., Ltd., £13 275; Electro-Mechanical Brake Co., Ltd., £13 600; Maley and Taunton, Ltd., £13 600; British Thomson-Houston Co., Ltd., £15 050; English Electric Co., Ltd., £15 050.

WORK IN PROSPECT.

BASINGSTOKE.—School, Worting. Particulars from the county architect, Mr. A. L. Roberts, The Castle, Winchester.

BILLINGHAM.—Housing scheme (100). Particulars from the surveyor.—Hotel for J. Eadie and Co.—Houses (34), Sunnybrow Estate, for Harland and Parker.

BIRKENHEAD.—Housing scheme (182) Particulars from Mr. R. W. Johnston, borough engineer.

BLACKBURN.—Housing scheme (200). Particulars from the Borough Engineer.

CAMBUSLANG.—Additional 52 houses. Particulars from Mr. P. C. Smith, district offices, Hamilton.

CANTERBURY.—Cement works, for Frank Cooper (Canterbury), Ltd.

DARLINGTON.—Extensions, War Memorial Hospital. Particulars from the contractors, Gustavus Bailey, Ltd., Newcastle on-Tyne.

DARTFORD.—Additional housing scheme (56). Particulars from the Surveyor.

DERBY.—Isolation hospital extensions to cost £50 000. Particulars from the Borough Engineer.

DOVER.—Laundry extensions. Particulars from William Beeston and Son, Castle Street.

EGHAM.—Isolation hospital extensions. Particulars from the surveyor, Mr. A. P. Sturt.

ELLESMERE PORT AND WHITBY.—Municipal buildings and Market Hall. Particulars from Mr. Eric E. Evans, 17, Beresford Road, Oxton, Birkenhead.

ELTHAM.—Boys' secondary school to cost £14 250.

GLENBOIG.—Additional 24 houses. Particulars from Mr. P. C. Smith, District Offices, Hamilton.

GLOUCESTER.—Hostel, Training College of Domestic Science, to cost £39 000. Particulars from the Director of Education, Gloucester.

HALESOWEN.—Housing scheme (326). Particulars from the architect, Mr. T. S. Beach, 5, New Road.

HALIFAX.—Operating theatre, St. Luke's Hospital, to cost £12 000. Particulars from the Clerk.

HARTLEPOOL.—Housing scheme (15), for the Town Council. Particulars from the Borough Surveyor.

HUDDERSFIELD.—Extensions, Salendine Nook Baptist Sunday schools to cost £2 750. Particulars from Mr. J. E. Lunn, Milnsbridge.

LANARK.—Reconstruction. Bank premises, for the Commercial Bank of Scotland.

LEWISHAM.—Houses (193), Downham, for the London County Council.

MITCHAM.—Houses (300), and shops. Particulars from Messrs. A. A. Moyniham.—School to cost £34 940. Particulars from the contractors, G. H. Denne and Son, Ltd., Deal.

NEW CROSS.—Rebuilding Kender Street school, to cost £14 383. Particulars from W. H. Gaze and Son, Ltd., Kingston-on-Thames.

NEW MALDEN.—Central school. Particulars from Mr. W. W. Finny, Kingston-on-Thames.

NEWTOWN (MONT.).—Maternity wards, County Infirmary. Particulars from the architect, Mr. A. Stanley Hill.

NORTHALLERTON.—Extensions, County Hall, to cost £9 027, for North Riding County Council. Particulars from the contractors, Armitage and Hodgson, Ltd., Camp Road, Leeds.

RIPON.—Showroom premises. Particulars from City Engineer.

ROMFORD.—Rebuilding station to cost £250 000, for the London and North Eastern Railway Co.

RUGBY.—Central and infants' schools, and extensions, College of Technology and Art (£7 120). Particulars from the Director of Education, Warwick.

ST. HELENS (ISLE OF WIGHT).—Houses (30). Particulars, Mr. W. J. Attrill.

SMETHWICK.—Central Clinic, and school, Uplands. Particulars from Director of Education.

SOUTHBOROUGH.—Cinema theatre. Particulars, the High Brooms Brick and Tile Co., Ltd.

SOUTHPORT.—Bank, Cambridge Road, for Lloyds Bank, Ltd., London.

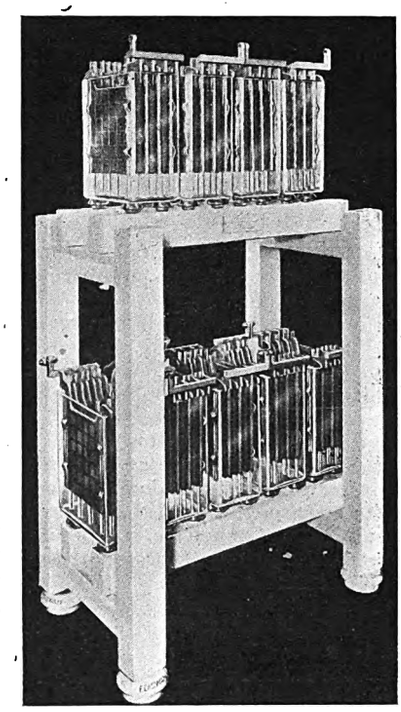
STOURBRIDGE.—Labour Exchange. Particulars from contractors, Messrs. T. W. Edwards and Sons, Audnam.

WELLINGTON (SALOP).—Housing scheme (12), Ketley, for Rural Council. Particulars, the surveyor, Mr. R. B. Phillips, Edgbaston House.

WINDSOR.—Houses (500), Farnham Road, for W. Gradwell and Co., Ltd.

TRADE PUBLICATIONS.

WE have received from FERRANTI, LTD., of Hollinwood, Lancs, copies of charts Nos. 1 and 2, which give full details for the construction of h.t. supply units, using respectively a full-wave metal rectifier and a full-wave valve rectifier. The output of each of these units is claimed to be adequate for the largest receivers in domestic use, and the design is in accordance with the usual "Ferranti" practice, with a view to eliminating back coupling or "motor-boating." It is stated that there is no appreciable mains hum on a good speaker up to a total audio frequency amplification of 5 000 times. These units can readily be assembled and enclosed within the "Ferranti" sheet steel safety box, when they will comply with the wiring regulations of the I.E.E.



A NEW type of stationary battery which has been added to the range of the Edison Swan Electric Co., Ltd., It is a 10-cell unit with A.C. type plates.

The PERFECTA SEAMLESS STEEL TUBE AND CONDUIT CO. (1923), LTD., of Plume Street, Birmingham, has published catalogue No. 16 covering the full range of conduits and fittings made to B.E.S.A. specifications.

YARROW AND CO., LTD., Scotstoun, Glasgow, have published a special brochure describing the Yarrow system of pulverised fuel firing.

"Bus Bodies and Trolley Buses" is the title given to a new publication, No. K27, by the ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, London, W.C.2.

J. A. CRABTREE AND CO., LTD., have sent us leaflet No. 1051, dealing with "Jacelite" moulded lampholders for industrial and domestic use.

MAWDSLEY'S, LTD., of Dursley, Glos, have compiled a new brochure in connection with electric arc welding sets. The brochure is one of considerable interest, in that the details are given in no fewer than five languages.

The JAMES KEITH AND BLACKMAN CO., LTD., 27, Farringdon Avenue, London, E.C.4, has published a new folder entitled "Induced Draught and Flue Dust Arresting." The issue is well illustrated, and gives a very full description for the plant recommended to power station engineers, etc.

The LONDON ELECTRIC FIRM, Brighton Road, Croydon, has published a special pamphlet dealing with the company's exhibits at the recent International Aero Exhibition. The subjects dealt with are aerodrome and airway lighting, including flood and boundary lighting, ceiling and signalling projectors, obstruction lights, Neon beacons, etc.

"Complete Small Power Houses" is the title of a new brochure issued by the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., of Trafford Park, Manchester. The new issue is intended to illustrate the compactness of small generating stations when the company's self-contained turbo-sets are installed. Developed only a comparatively short time ago, this combination, we understand, is finding a ready sale in every branch of industry. In addition to orders for the home country, orders have been received from Japan, Chile, India, Federated Malay States, South Africa, Australia, and Russia, for gasworks, supply stations, cement works, linoleum manufacturers, iron works, coal, iron, copper and gold mines, jute and textile mills, paper mills, civil contractors, and the Admiralty.

ELECTRICITY SUPPLY.

Inauguration of Holbeach Supply—New Power Station at Oldham—Good Progress of Heckmondwike Undertaking—Gillingham's Wiring Scheme—Official Opening of Ripon Supply—New Experiment at Avonmouth.

ELECTRIC street lighting was inaugurated at Otley last Saturday.

Finchley Electricity Committee recommends various mains extensions at a cost of £1 086.

East Grinstead U.D.C. has applied for loans of £6 000 for mains and services and £500 for meters.

Wimbledon Corporation has purchased a site in Poplar Grove, New Malden, for the erection of a sub-station.

The sum of £600 has been contributed from the profits of the Thornton Cleveleys electricity undertaking towards relief of rates.

Paul U.D.C. has consented to the application of the West Cornwall Power Co. for authority to supply electricity in Mousehole and Paul.

Salford Electricity Committee recommends acceptance of a tender amounting to £910 for the erection of a transformer sub-station at Pendleton.

Whitehaven T.C. has applied for a loan of £400 for extending the mains to a building site in Loop Road, and for an extension of the public lighting.

The Stretford and District Electricity Board is to take over the stores of Stretford Council's electricity undertaking at a price to be agreed, and this has been fixed at £16 558.

Kent County Council has sanctioned an expenditure of £8 500 for an electric light installation at the Barming Heath Mental Hospital, near Maidstone. Electricity will be obtained from Maidstone Corporation.

The Minister of Transport proposes to grant a Special Order to Johnson and Phillips, Ltd., for the supply of electricity within the Burgh of Dunoon. Objections may be posted not later than September 23rd.

To encourage the demand for electricity at Holbeach, four-light installations, with the necessary services, are being supplied free of cost to consumers. The streets were lighted electrically for the first time on August 15th.

The investigation into the administration and organisation of the Blackburn electricity undertaking is coming to a close. The special committee appointed by the Town Council to deal with the matter has agreed to its report.

Oldham Electricity Committee is to seek sanction for a loan of £50 000 for distributing mains. It has been arranged to have a formal opening of the new power station next October and to invite Sir Andrew Duncan to be present as chief guest.

Llanfairfechan U.D.C. has accepted the new terms offered by the North Wales Power Co. for a bulk supply. The terms are £6 per kW, plus ¾d. per kWh, but the maximum payable is not to exceed £11 per kW per annum including the kWh charge.

The Development Co., which is carrying out an electricity supply scheme for the Ponterwyd district, hopes to inaugurate the supply at the end of September. The charges for small houses in which meters will not be used will range from 20s. per annum for one light to 55s. for four lights.

Stepney (London) B.C. has received an application from Shoreditch B.C. for a bulk supply of electricity. The Electricity Committee has authorised the consulting engineer and manager of the Electricity Department to submit an offer for the consideration of the Shoreditch Council.

Macclesfield R.D.C. has received a request from the Mid Cheshire Electricity Supply Co., Ltd., for assent to the company's application for a Fringe Order to supply electricity by overhead lines to Great Warford. It has been decided to consent to the application on condition that underground mains are used.

The Minister of Transport proposes to confirm the Special Orders authorising Messrs. W. H., E. and W. Burton to supply electricity in Aysgarth and Reeth (Yorks) rural districts and the Hawes Electric Lighting Co., Ltd., to supply electricity within part of the Aysgarth (Yorks) rural district. Any objections must be sent to the Ministry by September 23rd.

Dr. H. S. Houldsworth, chairman of Heckmondwike Electricity Committee, stated at last week's meeting of the U.D.C. that the electricity undertaking showed a profit of £5 326 for the past year. Of the 2 500 houses in Heckmondwike, 900 were now consumers of electricity. The Council approved a recommendation to reduce the charge for lighting by 1d. per kWh, making it 4d.

Gillingham (Kent) Town Council has adopted a two-part tariff, on the basis of a fixed charge per annum of 15% of the net rateable value, plus ¾d. per kWh, as an alternative to the present flat rate for private properties. The Council has adopted the principle of a scheme for the installation of wiring and fittings, the wiring to be let out to contract with local contractors, the electric light department having the right to tender.

An Electricity Commission has produced a scheme for transmitting and distributing electricity to all parts of the Isle of Man at a capital cost of £85 000, the current being obtained from Douglas, where the Corporation is erecting a new generating station. Plans have also been prepared for hydro-electric development by utilising water power in Sulby Glen, the expenditure on this work being estimated at £150 000.

Lieut.-Col. Tucker held a Ministry of Transport inquiry recently into the application of the Derbyshire and Nottingham Electrical Power Co. for leave to erect an overhead cable at various points in the Hatton district. It was stated that 36 out of 38 owners of land had consented to the erection of the poles. The company offered to pay 4s. per annum as way leave, but one owner asked 14s. He said the erection of poles would be a handicap in mowing pastures, and amenities would be diminished.

The Ripon Corporation electricity undertaking was inaugurated on August 7th. The supply is purchased from Harrogate at a pressure of 11 000 V. Mr. W. C. C. Hawtayne has been the consulting engineer for the scheme, which has cost about £1 800, and the contractors were the Power Lines Construction Co. and Crompton Parkinson, Ltd. Ald. F. W. Hargrave, chairman of Ripon Electricity Committee, formally handed over the undertaking to the Mayor, who accepted it on behalf of the Corporation. At a subsequent luncheon, Mr. Neil McLean, the Harrogate borough electrical engineer, proposed success to the undertaking, and said he hoped Ripon Corporation would not merge the gas undertaking and the electric undertaking under one head. One of the finest things was to keep the two undertakings competing against each other.

Chorley Corporation Markets Inspector has reported on the electric lighting of the stalls on the market place. There are 22 tenants using electric light. The wires are encased in lead pipes, and carried along under the roofs of the stalls. The tenants have each made their own arrangements with the Lancashire Electric Power Co. The cost to the tenant for meter rent is 6s. 8d. per quarter, and the average cost (including meter rent) for the darkest quarter is £1 6s. 8d. for seven lights of 150 c.p. In regard to the canvas covered stalls, 75% of the tenants are willing to have electric light, provided the charge is reasonable. The Markets Committee has instructed the town clerk to approach the Lancashire Electric Power Co. with a view to an agreement being entered into with the Corporation in regard to electrical apparatus supplied to certain stalls on the market place, and to prepare a scheme for the supply of electricity to the canvas stalls on the general market.

It is announced that plant is in hand for carrying out, at Avonmouth, an experiment involving an original method for utilising impounded tidal waters, so that the energy developed at the time of the fall of the tide may be conserved and employed at the time of the slack water (when the levels inside and outside the dam are approximately the same). It is expected that the experimental plant will be completed and running in the course of the next three or four months. In the scheme to be demonstrated there will be installed a water turbine coupled to an electric generator, while coupled also to the water turbine will be a water heater. The water heated will be retained in a thermal storage vessel, and the power so conserved will be used to drive another electric generator when the main water turbines cannot be employed on account of the small difference in level between the impounded water and the river. This small experimental plant, which will probably be functioning within three or four months' time, will be approximately of 250 H.P. capacity. The experiment is being carried out under the auspices of the Hydro-thermal Power Co., Ltd., a British syndicate.

WIRELESS NOTES.

Increased Membership of the R.W.F.—New London Station Testing.

IN response to the desire of many radio manufacturers for an authoritative list of radio wholesalers, a comprehensive list of general radio wholesalers, with their branches, has been compiled by the Radio Wholesalers' Federation. The list comprises 181 wholesale radio depots, which, it is estimated, substantially cover the country and are capable of providing adequate wholesale service to the manufacturing trade generally.

It is common knowledge in the radio trade that the number of firms receiving wholesale distributors' terms is greatly in excess of the requirements of the industry, and it is equally well known that a number do not fulfil the conditions or purposes of general radio wholesalers. The main object of the list, which has been issued to 300 manufacturers, is to secure a definite understanding as to firms and companies entitled to receive wholesale distributing terms. Since the publication of the list, four new members have been added, and as radio retailers, in accordance with the " reciprocal understanding " between the R.W.F. and the W.R.A., will be interested to keep their files up to date, the names and addresses of the additions are as follows: J. G. Coates, Ltd., Bridge Street, Burnley; Eros (Dundee), Ltd., 27, Crichton Street, Dundee; Wm. A. Morton, 76–80, Surrey Street, Sheffield; Smith and Cookson, 22, Paradise Street, Liverpool.

The Potter's Bar Station.

The work of testing the new B.B.C. station at Potter's Bar, which will ultimately supersede the present 2LO, has now been started, and is likely to continue for two or three months. At present the tests are confined to a closed circuit, and no actual broadcasting is taking place.

Within a week or two there will be limited tests after the ordinary broadcasting hours, and interested listeners will no doubt be able to pick them up. Later, the new station will be used, during an experimental period, for the actual broadcasting of such subjects as dance music late at night, and after that, when all the station's special problems have been solved and local peculiarities have been dealt with, it will be put into full commission and will take the place of the present London station. This is expected to occur some time during the autumn, and about three months later a second transmitter, which is housed in the same building, will be brought into service to provide an alternative programme.

The navigation of a ship from Finisterre to Liverpool through fog, solely on wireless bearings, is reported in a communication from the master of the motor vessel " Athelking." The " Athelking " carries a Marconi direction finder, and, commenting upon the efficiency of coastal wireless beacon installations used in conjunction with the ship's direction finder, the captain states that he was able to take the usual four-point bearings for some distance off in spite of the fog. The report again emphasises the valuable aid rendered to navigation by wireless beacon stations, two more of which have recently been completed by the Marconi Co. for Trinity House, at Cromer and Dungeness lighthouses.

" Marking " Application Withdrawn.

The application made for an Order-in-Council requiring the marking of imported wireless sets, components and accessories with an indication of origin has been withdrawn, and the inquiry by the Standing Committee appointed by the Board of Trade arranged to be held on September 30th and October 1st has accordingly been cancelled.

FIXING " FULTOGRAPH " PICTURES.

For a long time past scientists have been conducting experiments to discover means of rendering permanent the pictures received by the " Fultograph " on paper treated with starch and potassium iodide. Until a short time ago no means could be found of making them as permanent as photographic prints. The credit for the discovery of a method of fixing these prints goes to Dr. Alfred J. H. Iles, of Taunton, who discovered that the key to the problem was to be found in that very common and inexpensive substance, alum. After reception, the picture is laid face downwards in a dish containing a solution of alum and ordinary tap water. One teaspoonful of alum to a pint of water is a satisfactory mixture. The picture then becomes as permanent as a photographic plate or print after fixing.

ELECTRIC TRACTION.

Sunderland Corporation to Reconstruct Trams—New Aluminium Car.

SUNDERLAND T.C. last week adopted the report of the Tramways Committee recommending a scheme to bring the present tramway system up to date by reconstructing the track, substituting more powerful motors for those now in use on cars, and speeding up the services. The scheme involves an expenditure of nearly £75 000 on the relaying of the track during five years. The Council rejected a proposal to scrap portions of the system and substitute buses.

An aluminium tramcar, which is said to be the first of its kind, has been placed on the streets of Pittsburg. The car is only about half the weight of a steel car of the same size, and it is claimed that it can easily travel at 45 miles an hour. The entire body and fittings are of aluminium, the floor is of flexolith, a non-skid composition, the car is painted in ivory and green, and the lighting has been arranged so as to avoid glare.

Representatives of Accrington, Rawtenstall and Bacup Corporations have agreed that a day near April 1, 1930, be fixed for the discontinuance of the tramways service and the substitution of a motor-bus service.

A railway terminal, chiefly underground, is to be built by the Canadian National Railways in Montreal, to the design of a British engineer, Mr. Frederick Palmer, at a cost of £10 000 000. Electric locomotives will be used to haul all trains into the station.

An extension of the system of weekly season tickets on the London Underground Railways recently came into operation. These tickets are now available from all stations on the Bakerloo line to all important stations on the Hampstead and City lines, and the Central London Railway.

A project is being made in Japan to establish a submarine railway company with a capital stock of 10 million yen. The project is to run a submarine electric railway between Kiushu and Main Island across the Channel. The project is independent of the one under way by the Government railways.

The Great Western Railway Co. proposes to instal an additional 400 kW motor-convertor and switchgear at Park Royal power station, to meet the increased demands that will be created by the running of 7-car trains on the Ealing and Shepherd's Bush Railway in place of the present 6-car trains.

The Ministry of Transport has confirmed a Provisional Order sought by Bradford Corporation for the running of railless trolley vehicles on most of the forty routes of the Bradford tramway system. It is estimated that the total cost of equipping all the routes for railless trolley vehicles would be £494 571. The relaying of track would cost £916 000.

A German firm has submitted to Kovno (Russia) City Board a proposal for the construction of an electric tramway at a cost of £175 000. The firm offer to do all the construction work and allow two-thirds of the amount to remain as a loan to the city, on condition that the city issues debentures to the firm, on which the latter could advance credits at a discount of 10%. The remaining third of the cost would have to be provided by the City in cash.

LEGAL INTELLIGENCE.

Holsworthy Electricity Supply—Gas Undertaking to be Discontinued.

At Barnstaple County Court, last week, an application was made on behalf of the Holsworthy Gas and Electric Supply, Ltd., to authorise an alteration in the company's articles of association. It was stated that the company's difficulty was that the consumption of gas had been decreasing year by year, whereas the consumption of electricity had been increasing. Added to that, the gas plant had suffered considerable depreciation of late, and the company could not find the money for repairing the plant and works. At the same time, the company desired to meet the needs of the inhabitants by reducing the cost of electricity. That could be brought about if the present gas plant was removed and new electrical plant substituted. They asked the judge to confirm the alteration put forward by the special resolution passed on March 14th and April 4th, 1929. No debenture-holder objected, and creditors had all been paid. Judge Lindley authorised the alteration on condition that the name of the company is altered by omitting reference to gas, or in such other manner as may be approved by the Board of Trade.

COMPANY NEWS.

Decline in G.E.C. Shares—Cables and Wireless Official Quotations—Improved Conditions for Mexican Utility Undertakings—Electricity in Copper Mines—Directors' Reports and Dividend Announcements—New Companies.

AFTER their last week's sharp rise, General Electric shares have relapsed from 66s. 3d. to 60s. There has been little doing, however, among other equipment shares, with the exception of an improvement of 6d. in Ever Readies, which are now 21s. 9d. Cables and Wireless stocks are now quoted in the Stock Exchange Official List, the 7½% non-cumulative "A" ordinary stock at 85, the "B" ordinary stock at 75½, and the 5½% cumulative preference stock at 95. Marconi's International Marine shares have dropped five shillings, to 61s. 3d. County of London Electric Supply shares, at 55s. 6d., have lost nearly half their last week's improvement.

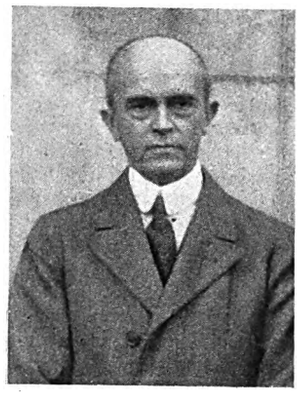
WAYGOOD-OTIS, LTD.—Intm. divs. at rate of 5% p.a. (same rate as last year) on ord. shs. is announced.

WASTE HEAT AND GAS ELECTRICAL GENERATING STATIONS, LTD.—Intm. divs. of 2½% for half-year ended July 31, 1929, (same rate as last year), will be payable, less tax, on Aug. 31.

NORTH AMERICAN CO.—Output for year ended June 30 last, 6 450 000 000 kWh, an increase of more than 13% over preceding year.



Mr. Wm. C. Lusk, who becomes chairman of British Thomson-Houston Co., and vice-chairman of Associated Electrical Industries, Ltd.

CONSOLIDATED GAS, ELECTRIC LIGHT AND POWER CO. OF BALTIMORE.—A div. on the common shs. of $¾ p. sh. for. qrtr. endg. Sept. 30 is announced.

CANADIAN GENERAL ELECTRIC CO., LTD.—Qrtrly. div. of 1¾% for 3 months endg. Sept. 30, 1929, being at rate of 7% p.a., on the pref. stk., will be payable on Oct. 1.

WESTMINSTER ELECTRIC SUPPLY CORPORATION, LTD.—Intm. div. of 8d. p. sh., less tax, on acct. of standard div. on ord. shs. for current year, will be payable on Sept. 2.

ADELAIDE ELECTRIC SUPPLY CO., LTD.—Coupon No. 47 attached to 6% cum. pref. sh. warrts. to bearer will be paid on and after Sept. 2 at the Bank of Adelaide, 11, Leadenhall Street, London, E.C.3.

HURST, NELSON AND CO., LTD.—Fin. div. of 2s. p. sh. and bonus of 6d. on ord. shs. in respect of year ended July 13, 1929, makg. a total of 20% for year (same as last year), will be payable on Nov. 11.

MELBOURNE ELECTRIC SUPPLY CO., LTD.—Coupon No. 49, attached to 8% 1st cum. pref. sh. warrts. to bearer, will be paid on and after Sept. 2 at the Bank of Australasia, 4, Threadneedle Street, London, E.C.2.

MEXICO TRAMWAYS CO.—Half-year's int. on gen. con. 1st mtge. 50 year 5% gold bonds will be paid on and after Sept. 2 at the Bank of Montreal, 47, Threadneedle Street, London, E.C., agst. surrender of coupon No. 33.

PENN-OHIO EDISON CO.—Definite 5½% gold debs., Series "B," due Feb. 1, 1859, are ready for exchange for outstanding $8 000 000 temporary bonds at the Central Hanover Bank and Trust Co., 70, Broadway, New York.

INTERNATIONAL PAPER AND POWER CO.—In first half of this year output of electy. was 2 284 956 000 kWh, increase 40%. Included in output figures are those of New England Power Association, Canadian Hydro-Electric Corporation, Ltd., and hydro-electric plants of International Paper Co. group.

OFFICIAL QUOTATIONS.—The Stock Exchange Committee has granted official quotatns. to 118 012 £1, fully paid, ord. shs. of Anglo-Portuguese Telephone Co., Ltd., 551 939 shs. of no par value of International Telephone and Telegraph Corpn.; £1 200 000 6% 25 year sterling bonds of Prussian Electric Co. and 15 002 £1, fully paid, shs. of Shanghai Electric Construction Co.

ASSOCIATED GAS AND ELECTRIC CO.—Merchandisg. sales for first six months of 1929 totalled $1 612 241, increase 54% over first half of last year. Of total sales, $1 230 799 represents electric appliances and $381 442 gas appliances. Above totals represent sales in only a portn. of co.'s territory. Merchandisg. in Rochester Gas and Electric, Metropolitan Edison, New Jersey Power and Light, Empire Gas and Electric, and the Elmira properties now promise to add materially to sales of the system. Employees of companies in the system, or affiliated, have been invited to subscribe to Class "A" stk. of Associated Co., which now controls utilities with asset value of over $800 000 000.

LAURENCE SCOTT AND ELECTROMOTORS, LTD.—For purposes of informatn., and not as an invitatn. to subscribe, particulars have been published. Co. was incorporated as a private concern some years ago under the name of Laurence Scott and Co., to acquire business of Laurence, Paris and

Digitized by Google

Scott, Ltd., electrical engineers, and to carry on mfre. of dynamos, motors, etc. For the purpose of amalgamatn. with Electromotors, Ltd., co. last April increased its authorised cap. from £259 995 to £310 995. Divs. have been paid every year since formatn. of co. in 1896, and for the past three years div. has been 7½%, tax free, while for 1928 there was also a 10% bonus. There are no debs.

East African Power and Lighting Co.—Pft. for 1928, includg. shs. 30 966 brt. fwd., Shs. 1 129 719. Div. for year on pref. shs. Shs. 339 634, depreciatn. acct. Shs. 180 000, writg. down exes. in connectn. with issues of cap. and survey expenses—Tana River, etc.—Shs. 705 805, leaving blce. Shs. 423 914. Directors propose div. on ord. shs. at rate of 6½% p.a., Shs. 390 000, carrying fwd. Shs. 33 914. In Nairobi area of supply, demand continues to expand in satisfactory manner. Developmt. of further hydro-electric works to augmt. supply for Nairobi area has been delayed by prolonged negotiatns. with Government. Auxiliary oil-engine statn. at Nairobi is now in commission. Progress in Mombasa has been satisfactory. Considerable extensions to Kilindini Harbour are in hand.

Compania de Electricidad de la Provincia de Buenos Aires.—Gross receipts for 1928, £571 111; workg. exes., includg. £40 000 for depreciatn., £338 365, leavg. workg. pft. £232 746, agst. £231 725. The increase is small, mainly due to fact that another co. established in Buenos Aires has obtained concessns. in some of the suburbs, thus creatg. a competitn. which has compelled co. to lower its tariffs. After deductg. gen. exes., directors' and trustees' fees and taxes in Europe, deb. int., sinking fund for redemption of bonds, commissns. and difference in exchange, net profit is £163 699, agst. £165 631. To res. £8 185, to directors £15 551, to res. fund (further allocatn.) £62 116 (agst. £71 767), div. of 8% on pre-pref. shs. £35 847 (agst. £27 847) div. of 8% on pref. shs. £42 000 (same). Sums paid as commissn. and other exes. in connectn. with issue of 200 000 new pre-pref. shs., amtg. to £22 014, have been written off entirely. Electricity sold was 19 697 436 kW, increase 1 905 291. Number of consumers reached 55 071, increase 6 948.

Company Meetings.

Mexico Tramways, Light and Power Co., Ltd.—The annual general meetings of the Mexican Light and Power Co., Ltd., and the Mexico Tramways Co., were held in Toronto on August 2nd. Mr. R. C. Brown, one of the vice-presidents, acted as chairman. The chairman referred to the disturbed conditions in Mexico which have somewhat reflected on the companies' operations, and stated that the trouble was fortunately now settled. He also mentioned the satisfactory settlement of the religious question, and informed the meetings that radical labour laws were now before Congress. He stated that construction progress was satisfactory, and the properties were being well maintained, so that, with the reconstruction of some of the plants and the modernising of the distribution system, the companies would be well prepared to meet the natural growth. The reports and accounts for the year 1928 were adopted, and the existing boards of directors were re-elected for the ensuing year, with the exception of Mr. E. R. Peacock, who for personal reasons has found it necessary to retire. Mr. R. O. McMurtry was elected to fill the vacancies on the boards.

Bwana M'Kubwa Copper Mining Co.—At an ordinary general meeting held in London, on August 1st, Sir Edmund Davis, chairman and managing director, said: The debit balance of March 31st, 1928, of £289 458, has been extinguished by deducting therefrom the net surplus for the year under review of £83 442, and an amount of £206 016 transferred from premium on shares account, and we are now in the satisfactory position of being able to commence the current financial year with a clean sheet. The year's working of the Bwana M'Kubwa mine showed a loss of £23 687, as against a loss of £169 784 for the preceding year, a reduction of £146 097. We are leaving nothing undone to accelerate development and equipment, and at the same time are taking all necessary steps to reduce working costs to a minimum. In this connection we are, in association with other mining and finance companies, forming a power company, which will instal hydro-electric plant of sufficient capacity to create 100 000 H.P., which should be transmitted at a cheap cost to the various Northern Rhodesian mines. We have the advantage of the experience of Rhodesia Broken Hill Co., which has now been running its hydro-electric plant and transmitting power for some time in not only a successful manner, but at a very cheap rate.

New Companies.

Hallwoods, Ltd.—Cap., £1 000. Contractors, electricians, etc. A director: J. A. Hallwood, 133, Bennett Street, Hyde.

Green and Jackson, Ltd.—Cap., £1 000. Electrical and mechanical engineers, etc. Reg. Office: 12, Cherry Street, Birmingham.

Disc-Bar Mills, Ltd.—Cap., £100. Mechanical, electrical and experimental engineers, etc. Reg. Office: 93, Drayton Gardens, London, S.W.10.

Reginald Smith (York), Ltd.—Cap., £600. Manufacturers of and dealers in motors, dynamos, electrical apparatus for telegraphs, telephones, etc. Reg. Office: 138, Micklegate, York.

Walker Brothers (Electrical Engineers), Ltd.—Cap., £10 000. To acquire business of electrical engineers now carried on by Walker Bros. at Quality House, Temple Row, Birmingham.

A. J. Dean and Co., Ltd.—Cap., £1 000. To carry on the business of electrical and wireless engineers, contractors for the supply of electrical plant, etc. Reg. office: 164, Eltham High Street, S.E.9.

Spalton Electrical Stores, Ltd.—Cap., £3 000. To carry on the business of manufacturers of and dealers in electrical and general engineering plant and equipment. Reg. office: 18, Cadman Lane, Sheffield.

Price and Belsham, Ltd.—Cap., £3 350. To acquire business of engineer as formerly carried on by J. T. Corbin as "Price and Belsham" at 52, Queen Victoria Street, London, E.C. Reg. Office: 52, Queen Victoria Street, London, E.C.4.

Leeds Fan and Blower Co., Ltd.—Cap., £100. Electrical and mechanical engineers, manufacturers of motors, fans, etc., and installers of electrical apparatus, erectors of electrical plant, etc. Reg. Office: School Close Mills, Neville Street, Leeds.

National Electrical Supplies Co., Ltd.—Cap., £3 000. To acquire goodwill of National Electrical Supplies Co., and to carry on business of electrical engineers and contractors, dealers in and agents for electrical supplies, etc. Reg. Office: 15 and 16, Fisher Street, London, W.C.1.

Manuus Manufacturing Co., Ltd.—Cap., £2 000. To adopt, agreement with A. B. Smith, H. J. Smith and D. Grant, and to carry on the business of manufacturers of electrical appliances, etc. formerly carried on by them as Manuus Manufacturing Co., and that of manufacturers of and dealers in wireless receivers, electricians, etc. Reg. Office: 53, Capethorn Road, Smethwick.

British Electrical Trust, Ltd.—Cap., £100. To acquire and turn to account shares, securities and obligations of any corporation or company carrying on or authorised to carry on business as generators or suppliers, or distributors of electricity, manufacturers of or dealers in machinery, articles and apparatus used for the equipment of electrical generating stations, or used in connection with the generation, distribution, supply, accumulation and employment of electricity, lay down and provide lines, etc. Reg. Office: 32, St. James's Place, London, S.W.1. (Public Co.)

THE LEAD MARKET.

Messrs. James Forster and Co., state that the market was subjected to holiday influences last week, the business done being of a very limited nature. Prices opened firmer, but subsequently a reaction took place on freer offerings of August lead, which resulted in a contango being established. Conditions both here and on the Continent seem likely to remain quiet for the rest of the month. Consumption, however, is well maintained as far as this country is concerned, and, given a sustained demand from the Continent, there does not seem much chance of prices declining to any extent. Closing prices on August 16th were £22 18s. 9d. for August, and £23 2s. 6d. for November, 3s. 9d. lower and 1s. 3d. higher, respectively.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

CENTRAL RADIO CO., Britannia Buildings, Fenwick Street, Liverpool, wireless dealers. £14 6s. 3d. July 6th.

HOLROSE MANUFACTURING CO., 43, Lonsdale Road, Kilburn, electrical engineers. £15 14s. 1d. July 2nd.

HUSBANDS, E. A. C., Mr, 16, Bridgegate, Retford, wireless dealer. £14 18s. 11d. July 4th.

HYDE AND COWLEY, 24, St. Alban's Road, Weymouth, electricians. £18 18s. 8d. July 12th.

LEICESTER AND HOLT, Sandcliffe Works, Lower Lane, Haslingden, electricians. £11 13s. 8d. July 9th.

PARKER (G. E.) AND SONS, Merchants' Exchange, Pontlottyn, electrical engineers. £10 4s. 2d. June 27th.

REX-O-TONE RADIO, 326, High Street, Bangor, radio dealers. £15 14s. 8d. June 19th.

SHIELDS AND GARE, 46, Queen's Road, Buckhurst Hill, electrical engineers. £10 12s. 10d. June 22nd.

WARNER, L. C., 4, School Lane, Leominster, wireless dealer. £11 8s. 7d. July 5th.

Bill of Sale.

SIDWELL, Amelia (wife of Stanley Sidwell), 36, Bristol Road, Birmingham, electrical contractor and engineer. Dated August 15th, filed August 19th. £50.

Receivership.

ENTERPRISE MANUFACTURING CO., LTD. P. Leask, of 27/8, Finsbury Square, E.C.2, was appointed receiver on August 8th, 1929, under powers contained in debenture dated June 12th, 1923.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

COURT RADIO CO., LTD., London, W.—Registered July 23rd £750 debenture, to S. H. Baker, Eldon Street House, E.C., C.A.; general charge (ranking as a 1st charge).

MERSEY ELECTRICS, LTD., Bootle.—Reg. August 7th, £1,000 debentures; general charge.

PERAK RIVER HYDRO-ELECTRIC POWER CO., LTD., London, S.W.—Registered August 1st, £1 600 000 debenture stock and premium of 5% inclusive of £1 350 000 already registered (secured by Trust Deed dated July 30th, 1929, supplemental to Trust Deed dated November 12th, 1926); charged on property charged by principal Trust Deed. *£2 600 000. December 28th, 1928.

POWER CONSTRUCTION CO., LTD., London, S.W.—Registered August 2nd, £4 500 and £4 500 mortgages, to Portman Building Society, 14, Orchard Street, W.; charged on 6 to 24 and 21 to 39, Leeds Avenue, Slough. *£36,925. January 14th, 1929.

RADIO SERVICE (LONDON), LTD. Registered July 16th, £1 500 debenture, to G. D. Le Livre, 105, Torriano Avenue, N.W.5, engineer; general charge. *£2 125. December 31st, 1928.

VERNON (C. N.) AND CO., LTD., Manchester, electrical engineers.—Registered July 29th, £700 debentures; general charge.

VIOZONE, LTD., London, W.C., electrical engineers.—Registered July 10th, £2 000 debenture, to S. Strauss, 104, Dartmouth Road, N.W., merchant; general charge.

Satisfaction.

BAXTER AND CAUNTER, LTD., London, W., electricians.—Satisfactions registered July 29th, £3 000 and £2 000, registered July 12th, 1926.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

WRIGHT (R.) AND CO., electrical engineers, 2, Middleton Road, Cheetham Hill, Manchester. The creditors were called together recently, when the representative of Baxendale and Co., Ltd. was elected to the chair. The statement of affairs showed ranking liabilities of £1 039, of which £912 was due to the trade, and £127 to the bank. The assets consisted of stock at cost £138, estimated to realise £69; work in progress £70; fixtures, fittings and goodwill £131, expected to produce £20; book debts £568, valued at £410; and motor car £20; making a total of £589, less £28 preferential claims, or a deficiency of £478. It was reported that the business was commenced in 1921 by R. J. Wright, who traded on his own account until 1924. He was then joined by a partner who brought in £100, but subsequently a dissolution took place. In 1926, the debtor was joined by another partner who also introduced £100 capital. The business appeared to have been successful until the end of last year, when there was a surplus of £37. The deficiency was accounted for by the depreciation written off the assets in the statement of affairs, and a loss on trading during the present year, together with costs of writs, amounting to £119. About four months ago the debtor Wright, who was the active partner in the business, sustained a serious motor accident, and was away for some time. The other partner had never taken any active part in the business. The debtor Wright had drawn £4 10s. a week, but his partner had never received anything. An offer was submitted of a composition of 10s. in the £, and the creditors decided to accept 12s. 6d. in the £, and failing the offer being increased to that amount, the matter to be referred to the three principal creditors.

London Gazette, etc.

Companies Winding-up Voluntarily.

HERD AND SNOWDEN, LTD. By reason of its liabilities, August 7th. T. G. Thompson, Incorporated Accountant, appointed as liquidator.

NEWCASTLE ELECTRICAL AND MOTOR ACCESSORIES, LTD. By reason of its liabilities, August 13th. I. Nixon, Gibb Chambers, Westgate Road, Newcastle-upon-Tyne, Chartered Accountant, appointed as liquidator.

SHARRATT ELECTRICAL CO., LTD. By Special Resolution July 24th, confirmed August 10th. J. L. Fielding, 368, Edenfield Road, Norden, near Rochdale, Accountant, appointed as Liquidator. Meeting of creditors at the offices of Hardman and Co., Ltd., The Baum, Yorkshire Street, Rochdale, Friday, August 30th, at 3 p.m.

Bankruptcy Information.

THORNTON, William Haigh, 25, Bridge Street, Burnley, electrical and wireless engineer. Receiving order, August 13th, Creditor's petition. First meeting, August 28th, 3 p.m., Official Receiver's Office, District Bank Chambers, Blackburn. Public examination, October 22nd, 11 a.m., County Court House, Bankhouse Street, Burnley.

TURNER, Oliver Bramwhite, Paddock House, Yeadon, Yorks, salesman of electrical apparatus. Receiving order, August 12th. Debtor's petition. First meeting, August 29th, 11 a.m., Official Receiver's Office, 24, Bond Street, Leeds. Public examination, October 1st, 10.30 a.m., County Court House, Albion Place, Leeds.

WOODHEAD, Titus Ernest, 26, Central Drive, Blackpool, electrical factor. Receiving order, August 16. Creditor's petition.

WATSON, Stuart Byrne, trading as S. B. WATSON AND CO., 73, Crouch Street, Colchester, Essex, electrical engineer and contractor. Receiving order, August 14th. Debtor's petition.

Notice of Intended Dividend.

SOUTHWOOD, Thomas Southwood Smith, Pound Farm, Whyke Road, Chichester, electrical engineer. First and final dividend, 1s. 7d. per £, payable August 28th, Official Receiver's office, 12A, Marlborough Place, Brighton.

Partnership Dissolved.

MARTIN AND BROWN (David Hope MARTIN and James Porter BROWN), wireless and electrical engineers, 46, Chapel Street, Hamilton, as at August 10th, 1929, by the retiral of J. Porter Brown. The business will be carried on by D. H. Martin at the same address.

Bankruptcy Proceedings.

WHITING, John Lawrence, 4, Portland Street, Newark, electrical engineer and contractor. The first meeting of the creditors herein was held on August 14th, at the Official Receiver's Offices, 22, Regent Street, Park Row, Nottingham. According to the statement of affairs there were liabilities amounting to £491, against assets of £13, or a deficiency of £478. Debtor stated that he commenced business in 1924 at Newark, without capital. In 1927 the debtor was appointed agent for the sale of electric lamps, and he received stock to the value of £50. Just after he received the lamps an execution was levied on his business premises, and the lamps were sold by the Sheriff. Debtor was called upon to replace the stock, and he had to pay £20 to settle the matter. From a trading account prepared for 1926 it appeared that the debtor had made a net profit of £4 12s. on a turnover of £600. He attributed his failure to want of capital and doing work at too low a price. The case, being a summary one, was left in the hands of the Official Receiver.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

313 395 R. Bosch, Akt.-Ges. Electrical ignition system for internal-combustion engines. (26/5/28.)
301 834 International General Electric Co., Inc. Spinning or weaving bobbins. (6/12/27.)
301 877 International General Electric Co., Inc. Bobbins for spinning or weaving mills. (7/12/27.)
13 031 G. W. Pierce. Magnetostrictive vibrator. (3/1/28.)
282 087 Akt.-Ges. Brown, Boveri, et Cie. Control of rotary transformer means for coupling two alternating-current networks consisting of a synchronous and an asynchronous machine with a commutator cascade machine. (13/12/26.)
313 634 C. E. Randall, L. R. Thompson and J. C. Savage. Optical apparatus for projecting illuminated signs upon screens. (14/12/27.)
313 539 B. H. C. Matthews. Device for measuring or recording electric potentials or currents. (14/12/27.)
283 503 H. J. Kuchenmeister. Apparatus for the registration of electric fluctuations. (11/1/27.)
313 540 Brown, Boveri, et cie Akt.-Ges. Abteilung Installationen. Suspension insulators. (13/1/28.)
313 465 British Thomson-Houston Co., Ltd. and R. D. Parry. Speed-regulating devices for dynamo-electric machines. (4/2/28.)
285 016 Electrolux, Ltd. Absorption refrigerating-apparatus. (8/2/27.)
313 468 W. R. Debenham. Dynamo-electric generators. (11/2/28.)
313 638 J. C. P. Kirkwood. Electric heat storage stoves. (16/2/28.)
285 798 W. B. Normelli. Absorption refrigerating-machines. (18/2/27.)
313 509 A. H. Midgley. Control of dynamo-electric machines. (6/3/28.)
286 698 Siemens and Halske Akt.-Ges. Receiving or amplifying circuit with incandescent cathode tubes having cathodes directly heated by alternating current. (9/3/27.)
313 427 A. J. Hall, W. T. Gray and Associated Electrical Industries, Ltd. Electric traction systems. (9/3/28.)
313 474 E. Simmons. Signs for advertising and other purposes. (12/3/28.)
313 475 British Thomson-Houston Co., Ltd., E. D. Regis and J. M. Goodall. Electric switchgear. (12/3/28.)
313 478 International Electric Co., Ltd. and F. R. Baldock. Telephones. (12/3/28.)
313 479 C. A. Turner and L. H. Wadsworth. Switches and plug-in sockets or like connections. (12/3/28.)
313 644 Simplex Conduits, Ltd. and H. F. McLoughlin. Electric lamps. (14/3/28.)
287 175 H. Eberhard and Radio-Frequenz Ges. Quartz oscillator for controlling transmitter valves and oscillation generators. (18/3/27.)
313 655 Haslam Foundry and Engineering Co. (1927), Ltd. and F. H. Foster. Refrigerating apparatus. (16/3/28.)
313 658 W. Haddon and J. M. Burnett. Electrical accumulators. (16/3/28.)
287 182 F. Conrad. Electric clocks. (17/3/27.)
313 661 British Thomson-Houston Co., Ltd. and C. W. Wood. Electric switches. (20/3/28.)
313 664 A. E. White (Leland Electric Co.). Electric motors. (20/3/28.)
292 546 Electrical Research Products, Inc. Television systems. (22/6/27.)
313 665 C. Filmer and Associated Electrical Industries, Ltd. Regulating systems for dynamo-electric machines. (20/3/28.)

Applications for Patents.

May 22nd.

15 832 Associated Electrical Industries, Ltd. Inductor relays. (22/5/28, U.S.,
15 884 Associated Telephone and Telegraph Co. Telephone systems. (6/8/28) U.S.)
15 850 J. W. Astley and British Insulated Cables, Ltd. Connecting device for stranded metal cables.
15 901 Automatic Telephone Manufacturing Co., Ltd., and C. Gillings. Telephone systems.
15 875 Belling and Lee, Ltd., and E. M. Lee. Thermionic valves.
15 876 Belling and Lee, Ltd., E. M. Lee and H. O'Connel. Portable support for wireless cabinets.
15 849 J. Bethenod. Electrical musical instruments, etc. (31/5/28, France.)
15 851 British Insulated Cables, Ltd., and C. Fletcher. Connector for electric conductors.
15 847 British Thomson-Houston Co., Ltd. Electrical windings. (22/5/28, U.S.)
15 867 Burovox, Ltd., and J. K. Haynes. Telephone systems.
15 898 A. E. Chernack. Machines for insulating electric cables, etc.
15 892 G. H. Darby and Oldham and Son, Ltd. Portable electric lamps.
15 855 W. W. Groves (I.G. Farbenindustrie A.G.). Accumulators.
15 866 Jacob, White and Co., Ltd., and A. D. White. Electric switches.
15 838 A. T. C. Moore, and Siemens Bros. and Co., Ltd. Intercommunication between telephone systems.
15 824 P. Ruck. Manufacture of zinc containers for galvanic elements, etc.
15 872 Siemens-Schuckertwerke A.G. High potential switch. (23/5/28, Germany.)
15 871 Siemens and Halske A.G. Means for determining electric creaks, etc. (22/5/28, Germany.)

May 23rd.

13 945 Benjamin Electric, Ltd., and H. T. Harrison. Means for dissipating heat from electric light fittings, etc.
15 976 British Thomson-Houston Co., Ltd. Simultaneous reproduction from sound and picture records.
15 939 C. Chaffer and R. E. Shaw. Devices for correcting deviation in magnetic compasses.
16 018 A. G. Clark. Electric switches.
15 944 Deltavis Co. Electric contact plug. (24/5/28, Switzerland.)
15 975 U. Doring and H. J. Spanner. Applying coatings to electrodes, etc. (23/5/28, Germany.)
15 987 C. S. Franklin. Electric circuit arrangements, etc.
15 969 E. Haefely et Cie A.G. Electrical condensers. (16/6/28, Germany.)
15 904 V. Hope. Electric fuse boxes.
15 988 E. Jaroslaw, Jaroslaws Erste Glimmerwarenfabrik, R. and S. Levis and M. and R. Schroeder. Electric bushing insulators. (24/5/28, Germany.)
16 001 Landis and Gyr Soc. Anon. Device for ascertaining excess consumption of electric meters. (16/6/28, Switzerland.)
15 842 L. B. Miller. Telephones operated by heat.
16 018 Plessey Co., Ltd. Electric switches.
15 946 J. R. Quain. Apparatus for electrical illuminations.
16 004 Siemens-Schuckertwerke A.G. Regulating transformers. (14/6/28, Germany.)
15 973 Soc. de Paris et du Rhone. Ignition distributing apparatus. (23/5/28, France.)
16 020 A. F. Tunstill. Switches for preventing operation of electric circuits.
15 987 B. J. Witt. Electric circuit arrangements.

May 24th.

16 077 E. J. Allmen. Incandescent lamps.
16 053 Associated Electrical Industries, Ltd. Oil insulated transformers, etc. (29/5/28, U.S.)
16 121 J. L. Baird, and Television, Ltd. Television, etc., systems.
16 080 British Thomson-Houston Co., Ltd. Motor control systems. (24/5/28, U.S.)
16 082 British Thomson-Houston Co., Ltd. Electric switches. (26/5/28, U.S.)
16 042 M. B. Field. Magnetic compasses.
16 081 International General Electric Co., Inc. Windings for electrical machines.
16 094 H. J. Kuchenmeister. Selenium, etc., cells.
16 049 L. C. Newham. Telantograph apparatus.
16 108 Siemens-Schuckertwerke A.G. Extinguishing arc in electric switches. (25/5/28, Germany.)
16 028 J. Spencer, Ltd., and Sir T. H. Spencer. Brackets for tramway etc., poles.
16 014 Sperry Gyroscope Co., Ltd. Compasses.

May 25th.

16 171 Arcturus Radio Tube Co. Vacuum tubes. (5/6/28, U.S.)
16 187 Celestion, Ltd., and C. French. Telephone instruments.
16 134 J. A. Crabtree. Metal boxes for electric switches, fuses, etc.
16 193 H. C. Drummond, Sir C. A. Parsons and G. G. Stoney. Treatment of light reflecting surfaces.
16 200 R. Kruger Telegraphen-Bananstalt. Telephone instruments. (26/2/29. Czecho-Slovakia.)
16 177 H. C. Le Vine. Electric toaster.
16 189 O. Muck. Telephone systems.
16 135 A. M. Taylor. Electric power transmission.
16 185 H. N. Wright. Apparatus for electrostatic separation of metals.

May 27th.

16 331 Brown, Boveri et Cie Akt.-Ges. Refrigerators. (5/6/28, Germany.)
16 308 N. R. Campbell and General Electric Co., Ltd. Manufacture of photo-electric cells.
16 342 A. K. Croad (N. V. Fabriek van Instrumenten en Elektrische Apparaten Inventum). Electrically heated bed-warmers, etc.
16 309 E. H. Croad and General Electric Co., Ltd. Control of electrical apparatus.
16 237 General Motors Research Corporation. Electric lamps. (1/9/28, U.S.)
16 228 E. S. Humphreys. X-ray apparatus.
16 273 J. Y. Johnson (I.G. Farbenindustrie A.-G.). Manufacture of layers sensitive to light.
16 290 Kolster-Brandes, Ltd. Piezo-electric crystal oscillator system. (26/5/28, U.S.)
16 288 C. Lorenz Akt.-Ges. Device for influencing radiation of electric waves. (20/10/28. Germany.)
16 286 A. Lulki. Light signal for wall switches, etc. (31/8/28, Germany.)
16 337 F. P. McBerty. Electric welding machines.
16 209 H. F. McLoughlin. Electrically welded metal tubing.
16 293 A. M. Newman and J. Suchomski. Wireless receiving circuits.
16 274 A. Rosenberg. Ultra-violet ray, etc., lamps.
16 296 J. W. Swendsen. Manufacture of magnetic cores for electrical machines, etc. (2/6/28, Norway.)
16 297 J. W. Swendsen. Induction motors. (2/6/28, Norway.)
16 259 J. W. White. Electric switches.

May 28th.

16 391 J. Anderson. Electromagnetic time lag device for circuit breakers, etc.
16 453 A. Baier. Alternating current induction motors.
16 435 British Thomson-Houston Co., Ltd., and G. S. C. Lucas. Photo-electric cells for reproducing sound from films.
16 436 British Thomson-Houston Co., Ltd. Incandescent lamps.
16 414 Callender's Cable and Construction Co., Ltd. Controlling tension of coils.
16 358 G. H. Champ and Eagle Engineering Co., Ltd. Gramophones, etc., and thermionic amplifiers.
16 392 Chloride Electrical Storage Co., Ltd., and H. Dean. Accumulators.
16 377 J. Christie and A. Reyrolle and Co., Ltd. Contacts for circuit breakers, etc.
16 386 H. Foxall and J. Lucas, Ltd. Electric switches for motor vehicle electric lamps.
16 428 K. Geyer and F. Ulbrych. Holders for incandescent lamps.
16 471 P. Hansen. Accumulators.
16 360 S. K. Kirtikar and B. A. Quint. Storage batteries.
16 413 J. G. Krüger. Electric motor.
16 388 J. Lucas, Ltd., and H. E. Whitehouse. Distributors for h.t. ignition equipments.
16 389 J. Lucas, Ltd., and E. O. Turner. Junction boxes for motor vehicle electrical installations.
16 390 J. Lucas, Ltd., and W. C. Turner. Cycle dynamos.
16 387 S. A. Mason. Ignition apparatus for engines.
16 440 Noris Zünd-Licht Akt.-Ges. and H. Weckerlein. Ignition systems for engines.
16 398 Schneider et Cie. Electric distant indicating apparatus. (10/7/28, France.)
16 378 D. S. S. Stewart. Transmitting apparatus for use with telephones, etc.
16 383 D. S. S. Stewart. Apparatus for transmission of sound from vibrating diaphragms. (13/5/29.)
16 396 W. W. Triggs (Kent Garage Investing Corporation). Controllers for electric circuits.
16 438 K. G. Wennerström. Melting materials in electric furnaces.
16 425 H. L. Worthington. Magnetic motors.

May 29th.

16 581 Accumulateurs Monoplaque, Soc. Anon. Accumulators. (29/1/29, France.)
16 582 Accumulateurs Monoplaque, Soc. Anon. Accumulators. (26/2/29, France.)
16 568, 16 589 Automatic Telephone Manufacturing Co., Ltd. Telephone systems.
16 485 J. E. L. Barnes (C. Kelly). Insulators.
16 515 C. R. Belling. Electric cooking ovens.
16 572 British Metallising Co., Ltd., and J. G. A. Rhodin. Non-conducting materials.
16 585 British Thomson-Houston Co., Ltd., and A. Maggs. Alternating current machines.
16 586, 16 588, 16 589 British Thomson-Houston Co., Ltd. Television apparatus. (29/5/28, U.S.)
16 550 A. Codelli. Television systems.
16 478 A. K. Croad (N. V. Fabriek van Instrumenten en Elektrische Apparaten Inventum). Electric heating devices.
16 587 Elektrizitats Akt.-Ges. Hydrawerk. Electric condensers. (29/5/28, Germany.)
16 476 N. W. Gilbert and H. C. E. Jacoby. Alternating current motors.

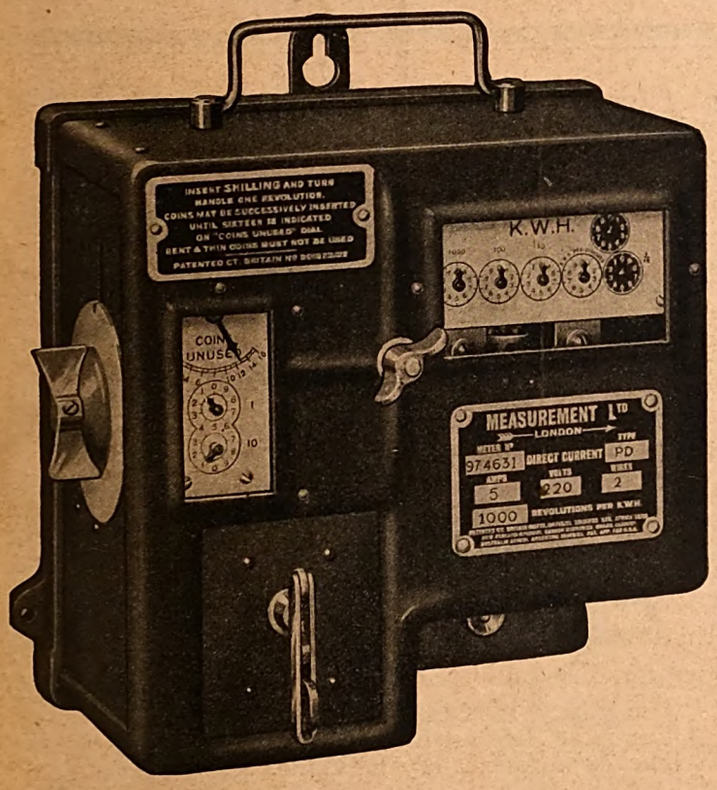
Vol. CIII.—No. 2674. Friday, August 30, 1929. [Registered at the General Post Office.] Sixpence

Your Guardian against Bad Debts, Inaccuracies and Irregularities



THE outstanding advantages and sound British Construction of "Measurement" Meters are an insurance against unreliability and inaccuracy: special attention has been paid to immunity against fraud.

Write for particulars of our A.C. and D.C. prepayment Meters.

OUTSTANDING FEATURES.

i. The coin box is independent of the meter cover.

ii. Price change wheels can be fitted in situ in one minute.

iii. The operation of mechanism is independent of gravity, etc.

iv. The meters are small in bulk and light in weight, the A.C. prepayment meter weighing only 14½ lbs. and the D.C. prepayment meter 19 lbs.

PRICES ARE COMPETITIVE.

A Battery Revolution.

USUALLY when somebody unknown in the electrical world, and generally a priest or a pork butcher, is credited with the invention of a revolutionary type of electric storage battery we know what to do; the wonderful discovery which secures top of column spaces in the daily papers goes no further. The case is somewhat different in regard to the claims put forward on behalf of what appears to be a most remarkable battery constructed by a Dublin University graduate, Mr. J. J. DRUMM, for, if reports from Ireland are correct the development of the invention is being partially undertaken by the Irish Free State Government, following the receipt of favourable reports on the battery from Prof. NOLAN, lecturer in experimental physics at University College, and Dr. HENRY KENNEDY, a member of the Irish Electricity Supply Board. Despite the complete lack of technical information regarding the invention and the remarkable claims that have been made, the high quarters in which the inventor has obtained support turn natural incredulity into anxiety to hear the true facts about a discovery which, if its promise is practically fulfilled, will bring about as great a revolution in the electrical world as did SWAN'S incandescent lamp invention. At present the I.F.S. Government does not seem to be contemplating any application beyond that of railway electrification, and in this direction it expects to electrify the main line between Dublin and Cork at a cost of less than £80 000, compared with the £1 000 000 or more that would be required under existing overhead or third rail systems. It is understood that a railway test of the invention is to be held in Dublin early next month. We hope that on this occasion independent technical observers will be given an opportunity to judge its merits for themselves.

A Real Incentive.

THE need for a battery many times more effective than the types now recognised as incapable of further improvement is such as to justify great interest in Mr. DRUMM'S efforts, and, indeed, in any serious attempt to provide a means for placing large-scale battery traction on a practical basis. At present those most likely to be able to undertake the work lack either the means or the incentive to deal actively with the problem. The offer of a substantial money prize, as suggested by a writer in our correspondence columns this week, for the production of a battery meeting certain easily defined requirements would provide the necessary stimulus.

The Second World Power Conference.

PREPARATIONS are now well in hand for the Second World Power Conference, to be held in Berlin from June 16th to 25th, 1930, and from the preliminary details already available it is apparent that the organising committee in Germany is sparing no effort to make the event a worthy successor of the first conference of its kind, which, as readers will remember, was held at Wembley in 1924. The chief subject around which discussion will centre at the 1930 conference will be the development of power supply and power utilisation. Interesting information may therefore be forthcoming in such directions as new fields for the application of power; the efficient utilisation of generating plants and distribution networks and the improvement of load factor; the storage of power; the advantages of interconnection; the reduction of constructional costs; and tariff systems, to mention only a few of the problems which will definitely receive attention. The extensive nature of the programme will, of course, preclude the reading of papers at the meetings, but all the papers accepted will be printed and distributed to the participants before the Conference. Discussion will follow the reading of general reports, which will give a clear picture of the contributions received in each particular section, and the outstanding points to be discussed. Apart from the business sessions and an attractive social programme, the Conference will provide opportunity to visit a number of important German industrial centres. In Berlin delegates will see the electrical engineering works, and power stations in Central Germany, the Rhineland and Westphalia—especially those using brown coal—will be inspected. Visits to Bavaria and Baden will be arranged to include inspection of interesting water power plants.

Safety in Mines Research.

IN Safety in Mines Research Board Papers Nos. 38 and 39, particulars were given of experiments made to determine the pressures produced on blowing electric fuse links and striking electric arcs in closed vessels when using currents up to 1 350 A at 575 V. In collaboration with the British Electrical and Allied Industries Research Association, and with the aid of facilities granted at Stonebridge Park, London, by the London, Midland and Scottish

Digitized by Google

Railway Co., the experiments have been continued with currents up to 10 000 A at 600 V d.c. An account of these later experiments, and a record of the results, has been published in the Safety in Mines Research Board's Paper No. 52, "The Pressure produced on Blowing Electric Fuse Links and Striking Electric Arcs in Closed Vessels," by G. Allsop (H.M. Stationery Office, price 1s. net). The paper records in tabular form the pressures produced by arcs of varying intensity and duration in closed fuse boxes of 400 cu. in. capacity when filled with air and with inflammable firedamp-air mixtures. A table shows the variations caused by using fuse boxes of differing capacities. The chief source of danger with the closed fuse box was found to be the failure of the insulation of the casing, with the establishment of an arc which might melt the casing.

Keep a Record.

MEMORY is a surprising faculty—as surprising by its freaks in functioning as in its occasional failure to function. The helpful law of association notwithstanding, and despite the strange way matters long forgotten are brought back to recollection, in the majority of cases for the majority of men, memory is a sorry hack to trust if precise and accurate reproduction of the thing desired is needed at once. The moral is obvious. Commit the important matter to writing, and, equally important, docket the record so that the note can be consulted as and when required. This is a most advisable precaution in the case of the busy individual; it is indispensable when it comes to the question of a company's larger affairs. It is really astonishing how slipshod and careless many men are who have vital data to collect. It is tragically easy and natural to imagine at the time that a particular reference cannot be forgotten, and it is not always easy to snatch the necessary minute in the midst of multifarious duties to record it. Nevertheless, it is true that the minute commandeered for the docket note is frequently the minute in time which saves nine hours. The record card, containing salient facts in digest tabloid form, is a most invaluable expedient. Its uses and its scope are manifold. Not only an aid for employment or promotion purposes, it serves admirably as a cross-indexing agent for various important data. Test results, for example, can be of great service when properly and informingly docketed. The record card, too, can be pressed into most fruitful use in connection with material which, from one cause or another, has to be diverted from its original allocation, and put to stock for possible future requirements. All too often such relegations find their way into some obscure corner of the stores, only to be unearthed at stocktaking time. After a period of years they pass to the scrap pile—unused when they might have been used. One man saw the potentialities such stock offered. He took pains in the first instance to prepare the necessary information, such as salient features of the components, the size and departure, if any, from precedent, and modifications required to the environment in which the particular part could be used. He circularised interested departments and put the onus on them for not using such stock. The system worked admirably.

"Met, Nat and Emp."

THE steady process of modernising the London telephone system by making it all-automatic will be advanced a further stage to-morrow, (Saturday) when London's largest automatic telephone exchange building will be opened in Wood Street, Cheapside. This building will house METropolitan, NATional and EMPire, the first three of eight new automatic exchanges to be established in London between now and the end of the year. The present transfer to the automatic service will benefit 6 500 subscribers, thus bringing the total number of automatic stations in London to over 45 000. On Saturday next the present Metropolitan manual exchange will be transferred in its entirety to the automatic system without change of title, while National will go over *en bloc* a few days later, probably on September 7th. In addition, certain subscribers at present on the London Wall, Clerkenwell, City and Central Exchanges have been notified of their transfer to the new automatic exchanges. Empire will be brought into operation later.

Growth of Automatic Telephony.

DESPITE the present rapid growth of automatic telephony in London and elsewhere, Britain has far to go before her figures can compare with those of the U.S.A., which can already claim 6¼ million "diallers." Mr. H. L. HARRIS, executive vice-president of the Associated Telephone and Telegraph Co., speaking recently of the rapid developments in the United States, said "the fact that in this country there are more than 6¼ million public telephone stations converted to automatic working, and the further fact that, during the next five years, the Bell system programme alone, for conversion to automatic working, will require over 350 000 lines of automatic equipment annually, provide strong evidence of the success of the automatic service." While progress has been much slower in this country, there are already 13 automatic exchanges in the London inner telephone area out of a total of 57 telephone exchanges. By the end of the year the number will have been increased to 21.

British Broadcasts from the Continent.

THE possibility of broadcasting from British radio stations events taking place on the Continent or in Ireland is opened up by an experiment which has just been made at Montevideo, the capital of Uruguay. A programme of opera which was given at the Colon Theatre, Buenos Aires, was transmitted by land line to the banks of the Rio de la Plata, where it connected with an under-water cable which had been specially designed for the International Telephone Service. The transmission was continued to Montevideo by land line. Special amplifiers were introduced at the theatre and along the route, and specially balanced submarine cable was used to span the 35 miles of water between the banks of the river. The success of the Montevideo broadcast would seem to point to the possibility of broadcasting Continental events from British broadcasting stations, relaying them with much greater success than the present method of re-broadcasting, which is often interrupted by atmospherics. It is gratifying to note that the submarine cable used in the Buenos Aires-Montevideo experiment was made in England.

The "Circle" Movement.

THE Electric Circle movement, started in connection with the Electrical Development Association's "W.O.B." Campaign, has probably done more than anything else to bring together in their own localities the various sections of the electrical industry. Fortunately, many of the original Circles are still in existence, and are functioning even better than they did in the experimental days. Others exist, but only in name, and still other districts are unfortunately without even a dormant Circle organisation. It would be an excellent thing for the industry if a definite effort could now be made to re-vivify the inactive Circles and set up new Circles in the areas which are not so organised. We wonder who will perform this public service. In former years there has been a specialised autumn and winter campaign organised jointly by the E.L.M.A., and the E.D.A., and in each case the Circle organisation has been called upon to work the scheme locally. This year, however, with campaigning almost entirely decentralised, there is no definite call on the Circles to exert themselves in a particular direction. This being so, it seems not at all unlikely that the invaluable Circle movement will languish when it should grow, and that the good work of co-ordinating sales effort between the various branches of the industry will lapse automatically. That such a retrograde movement should be allowed to continue is unthinkable, and we trust that some means will be found before the opening of the autumn season for giving the necessary stimulus to increased Circle activity.

GENERAL SOLUTION FOR HIGH FREQUENCY TRANSFORMER AND OSCILLATING SYSTEMS.

Some Considerations in the Qualitative and Quantitative Explanation of Phenomena Associated with Transformers and Related Apparatus.

By T. G. HODGKINSON, M.I.E.E., F.Inst.P.

IN power work and telephony it is rarely possible to regard capacities in transformers otherwise than as distributed in a complicated manner, but in high frequency work it frequently happens that the capacities belong to associated apparatus such as valves, rather than to the transformers themselves, and the following work is particularly applicable.

Even in low and audio frequency work there are cases when results given in the following notes will give a qualitative if not a quantitative explanation of phenomena associated with transformers, and attention is drawn to the symmetrical arrangement of the capacity and magnetic coupling factors in the system.

Solution of Transformer Network.

In the system of Figure 1 an inductance l, having resistance r and a shunt capacity P, in series with a conductance s is coupled with mutual inductance M and capacity c to another inductance L, having resistance R and a shunt capacity Q in series with a conductance S.

The conductance s is also the seat of an internal electro motive force V, and it is generally required to ascertain the electro motive force V_1 across the conductance S, as would be the case if S was the conductance of a valve grid-filament space.

If this system is analysed the resulting differential equation can be arranged as follows :—

$$(1)\ \Big[(Ll-M^2)[(Q+c)(P+c)-c^2]\,d^4/dt^4+[(Rl+rL)[(Q+c)(P+c)-c^2]+(Ll-M^2)(S\overline{P+c}+s\overline{Q+c})]\,d^3/dt^3+[L(Q+c)(1+rs)+l\overline{P+c}\,(1+RS)-Mc(2+RS+rs)+Rr[(Q+c)(P+c)-c^2]+ls\,R\overline{Q+c}+LSr\overline{P+c}+(Ll-M^2)sS+Mc(RS+rs)]\,d^2/dt^2+[(LS+R\overline{Q+c})(1+rs)+(ls+r\overline{P+c})(1+RS)]\,d/dt+(1+RS)(1+rs)\Big]V_1=\Big[\overline{Ll-M^2}c\,d^3/dt^3+\overline{Rl+rL}\,c\,d^2/dt^2+\overline{M+Rrc}\,d/dt\Big]sV.$$

This is not the terrifying problem it appears at a first.

The absolute value of V_1 can be abstracted right away for particular cases where V and the electrical quantities are known, but it is generally of more importance to study the modes of Forced and Transient response. These solutions

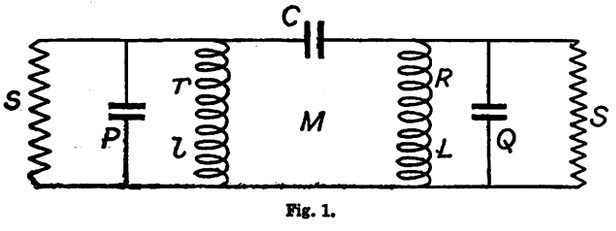

Fig. 1.

as a rule involve cumbersome algebraic expressions, and one is tempted to make unwarranted assumptions in order to simplify these sufficiently to grasp the working of the system. These expressions, however, although cumbersome, are generally symmetrical, and will frequently succumb to a notation. Such a notation is used here in order to present the solutions in the most general form for both modes of response of this system which has two degrees of freedom.

The terms of the fourth line are written in small letters, and these terms, when divided by $(L\overline{Q+c})(l\overline{P+c})$ will be recognised as the squares of damping coefficients and very small quantities in circuits this problem is mainly concerned with; however, without losing sight of them, write them φ^2, and we can rewrite the coefficient of V_1 above.

$$(2)\ (Ll-M^2)[(Q+c)(P+c)-c^2]\Big[d^4/dt^4+\alpha^2\,d^3/dt^3+(\beta+\varphi^2)\,d^2/dt^2+\gamma\,d/dt+\delta\Big]V_1$$

α^2 is of the same order as φ^2 and this coefficient readily factorises into :—

$$(3)\ \Big[d^2/dt^2+\tfrac{1}{2}(\alpha+\theta)\,d/dt+n^2_+\Big]\Big[d^2/dt^2+\tfrac{1}{2}(\alpha-\theta)\,d/dt+n^2_-\Big](Ll-M^2)[(Q+c)(P+c)-c^2]V_1$$

Where :—

$$\theta=\frac{\tfrac{1}{2}\alpha\beta_1-\gamma}{\sqrt{\beta_1{}^2\tfrac{1}{4}-\delta}}.$$

$$n^2_+=\beta_1\tfrac{1}{2}+\sqrt{\beta_1{}^2\tfrac{1}{4}-\delta}.=(2\pi f_+)^2$$

$$n^2_-=\beta_1\tfrac{1}{2}-\sqrt{\beta_1{}^2\tfrac{1}{4}-\delta}.=(2\pi f_-)^2$$

and

$$\beta_1=\beta+\varphi^2-\frac{\alpha^2-\theta^2}{4}.$$

This is a cubic in θ, but remembering what has been said

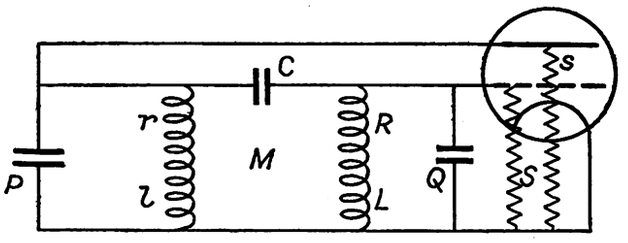

Fig. 2.

about φ^2 and α^2 being small quantities, and after all it is our concern to make them small, θ is readily determined approximately as $\frac{\frac{1}{2}\alpha\beta-\gamma}{\sqrt{\frac{1}{4}\beta^2-\delta}}$.

This also determines the modes of forced response—i.e., the natural frequencies of the system f_+ and f_-.

A careful examination of the coefficient (1) discloses the fact that the quantities $M/\sqrt{Ll}$ and $c/\sqrt{(Q+c)(P+c)}$ are symmetrically arranged in the expression.

$M/\sqrt{Ll}$ is the well understood magnetic coupling factor k, but is more easily used if it is written Sin k. In the same way $c/\sqrt{(Q+c)(P+c)}$ is the capacity coupling factor and in what follows is written Sin ε.

If now A is the arithmetic mean of $L\overline{Q+c}/1+RS$ and $l\overline{P+c}/1+rs$ and G is the geometric mean.

$$(4)\qquad 1/A_1n^2_{\mp}=1-\text{Sin } k\text{ Sin }\varepsilon\,G/A_1\pm\sqrt{(1-\text{Sin } k\text{ Sin }\varepsilon\,G/A_1)^2-\text{Cos}^2k\,\text{Cos}^2\varepsilon\,G^2/A_1{}^2}$$

Where $A_1=A$ with the addition of what can be shown to be the very small terms $\frac{\varphi^2-\frac{\alpha^2-\theta^2}{4}}{2\delta}$.

The solution with the positive sign before the radical is the longer wave, and is distinguished as the "Sum Mode" while the one with the negative sign is referred to as the "Difference Mode" in what follows.

G is less than A, which is less than A_1, and in Graph I the values of $1/A_1n^2$ are plotted against values of Sin k, Sin $\varepsilon\,G/A_1$ for values of Cos k Cos $\varepsilon\,G/A_1=0$, 0·2, 0·4, 0·6, 0·8, and 1·0.

The greater of the two quantities $L\overline{Q+c}/1+RS$ and $l\overline{P+c}/1+rs$ can be written $A_1(1+\sqrt{1-G^2/A_1{}^2})$ and the less $A_1(1-\sqrt{1-G^2/A_1{}^2})$ and notice that

$$\frac{1}{(1-\text{Sin } k\text{ Sin }\varepsilon\,G/A_1)n^2_{\mp}}\ \begin{matrix}>\text{ the greater}\\<\text{ the less.}\end{matrix}$$

Digitized by Google

This result is well enough known for the case in which Sin $\varepsilon = 0$—i.e., in which there is no capacity coupling.

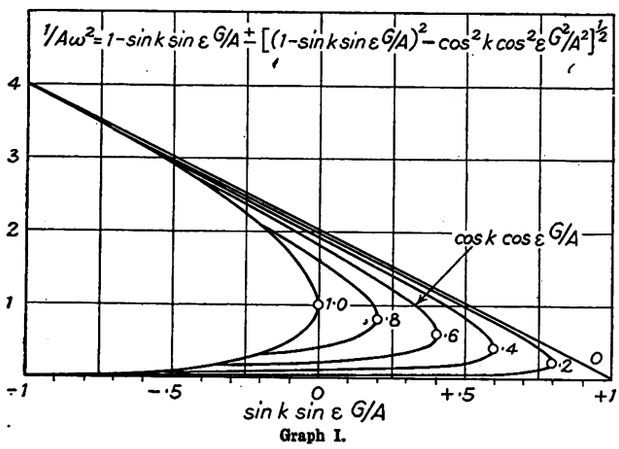
The quantities RS and rs are small quantities in high frequency work, but are often important in audio frequency calculations, however, still bearing them in mind we can imagine the resistances and inductances divided by their corresponding factors—i.e.,

$$R = R/1+RS \qquad r = r/1+rs$$
$$L = L/1+RS \qquad l = l/1+rs.$$

and then write the general expression for the EMF, V_1.

$$(5)\quad V_1 = \frac{M - Llcn^2_{\mp}\cos^2 k + Rrc - M\frac{RS+rs}{2} + icn_{\pm}(Rl+rL)}{\left(\gamma/\delta - \alpha/n^2_{\mp}\right)\left[1 - in_{\pm}\frac{\gamma - \alpha n^2_{\mp}}{\beta_1^2 - 4\delta}\right]}.$$

Ignoring the small terms and the quadrature phase term



Graph I.

for the moment, assuming provisionally that the product $L\overline{Q+c}/1+RS$ is greater than the product $l\overline{P+c}/1+rs$, and substituting values of $n^2_{\mp}$ from (9).

$$(6)\quad V_1 = \frac{[\text{Sin } k \pm \text{Sin } K]\, s\, V}{\left[S(1 \pm \text{Cos } \overline{K-k}) + \frac{R\overline{Q+c}}{L}(1 \pm \text{Cos } \overline{E-\varepsilon})\right]\sqrt{\frac{L}{l}} + \left[s(1 \mp \text{Cos } \overline{K+k}) + \frac{r.\overline{P+c}}{l}(1 \mp \text{Cos } \overline{E+\varepsilon})\right]\sqrt{\frac{l}{L}}}$$

where

$$\text{Sin } K = \frac{\text{Sin } k - \text{Sin } \varepsilon\, G/A_1}{\left[(1 - \text{Sin } k \text{ Sin } \varepsilon\, G/A_1)^2 - \text{Cos}^2 k \text{ Cos}^2 \varepsilon\, G^2/A_1^2\right]^{\frac{1}{2}}}$$

and

$$\text{Sin } E = \frac{\text{Sin } \varepsilon - \text{Sin } k\, G/A_1}{\left[(1 - \text{Sin } k \text{ Sin } \varepsilon\, G/A_1)^2 - \text{Cos}^2 k \text{ Cos}^2 \varepsilon\, G^2/A_1^2\right]^{\frac{1}{2}}}$$

The general adoption of circular functions in these expressions is justified by the facility with which the magnitudes can be grasped.

The coefficients $1 \pm \text{Cos } \overline{K-k}$ and $1 \pm \text{Cos } \overline{E-\varepsilon}$ are associated with the conductances ($\frac{R\overline{Q+c}}{L}$ has the dimensions of a conductance) of the circuit having the greater product of inductance and shunt capacity.

The values of the angles K and E are very readily estimated since

$$(1 - \text{Sin } k \text{ Sin } \varepsilon\, G/A_1)^2 - \text{Cos}^2 k \text{ Cos}^2 \varepsilon\, G^2/A_1^2$$

can be rewritten

$$(\text{Sin } k - \text{Sin } \varepsilon\, G/A_1)^2 + \text{Cos}^2 k\,(1 - G^2/A_1^2)$$

or

$$(\text{Sin } \varepsilon - \text{Sin } k\, G/A_1)^2 + \text{Cos}^2 \varepsilon\,(1 - G^2/A_1^2)$$

If Sin k is greater than Sin $\varepsilon\, G/A_1$ or negative, Sin K has the sign of Sin k, and unless Sin ε is greater than Sin $k\, G/A_1$ or Sin k is negative, Sin E is negative.

In general, in high frequency work the quantities equivalent to those we have called the conductances S and s are determined by the problem, while the quantities more within the control of the designer are the quantities $R\overline{Q+c}/L$ and $r\overline{P+c}/l$ which have the dimensions of conductances.

The resistances R and r include skin effect, radiation losses, etc., and are complicated quantities which have been discussed in detail by various writers. Inductances and capacities are also functions of frequency to a less extent and the art of coil making has been considerably developed.

For a particular size, shape and type of coil the minimum resistance will usually be roughly proportional to the inductance, so that the determining quantities in these losses terms will be the associated capacities $Q+c$ and $P+c$..

The damping coefficients for the two modes are

$$(7)\quad \tfrac{1}{2}n^2 \mp \left[\frac{LS(1 \pm \text{Cos } \overline{K-k}) + R\overline{Q+c}(1 \pm \text{Cos } \overline{E-\varepsilon}) + }{ls(1 \mp \text{Cos } \overline{K+k}) + r\overline{P+c}(1 \mp \text{Cos } \overline{E+\varepsilon})}\right]$$

Where the upper sign refers to the "sum mode" (long wave) and the lower to the "Difference Mode" (short wave).

Remember that this refers to a case where $L\overline{Q+c}/1+RS$ is greater than $l\overline{P+c}/1+rs$. If the reverse is the case the coefficients of the upper and lower lines above are interchanged.

In order to compare these modes, multiply the damping coefficients by $\pi/n_{\mp}$, to give the decrement, and it will be appreciated that transformers can be made selective for modes of response that are quite widely separated.

Decrements will vary from say 0·01 to 0·2, and as an example of the use of the foregoing work, say that we wish to design a tuned transformer, given the values of s, S, P and c, and we decide to tune in the sum mode on the conductance S, i.e., $L\overline{Q+c}$ is to be made greater than $l\overline{P+c}$.

Reverting to the magnification coefficient (6) the optimum value of l will make

$$ls(1 \mp \text{Cos } \overline{K+k}) + r\overline{P+c}(1 \mp \text{Cos } \overline{E+\varepsilon})$$

equal to $LS(\pm \text{Cos } K-k) + R\overline{Q+c}(1 \pm \text{Cos } \overline{E-\varepsilon})$

so that the decrement can be written under these conditions

$$\pi n_{-} L\overline{Q+c}\left[\frac{S}{\overline{Q+c}}(1 + \text{Cos } \overline{K-k}) + \frac{R}{L}(1 + \text{Cos } \overline{E-\varepsilon})\right]$$

$n.^2$ $L\overline{Q+c}$ is not much less than unity, and if Sin k is large (0·7 is a very reasonable value) and Sin ε is made small, the above can be rewritten very roughly

$$2\pi/n_{-}\left[\frac{S}{\overline{Q+c}} + 0{\cdot}7\frac{R}{L}\right].$$

We can guess right away the size of the coils to give the necessary value of R/L and size of the condenser to give the required value of $S/Q+c$.

L is determined now by reverting to the frequency solution. Equation (5) and the only requirement now is to decide the optimum value of l by equating the terms

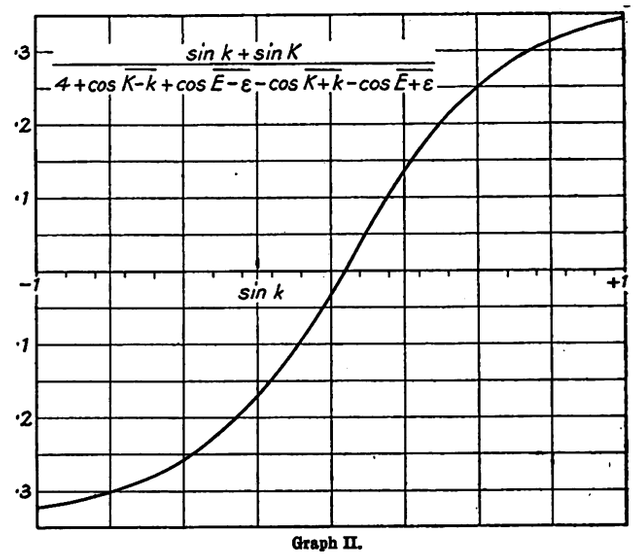
$$ls(1 - \text{Cos } \overline{K+k}) + r\overline{P+c}(1 - \text{Cos } \overline{E+\varepsilon})$$

to the terms

$$LS(1 + \text{Cos } \overline{K-k}) + R\overline{Q+c}(1 + \text{Cos } \overline{E-\varepsilon})$$

Sin ε is now accurately known, as well as Sin k, so that if the latter is made large K and E are approximately determinate and the ratio l/L follows as a matter of course.

A more accurate value for $\overline{Q+c}$ can be obtained by referring



Graph II.

back to the frequency equation and the design is completed.

Graph II is a graph of the value of

$$V_1 S\sqrt{\frac{L}{l}} = \frac{\text{Sin } k + \text{Sin } K}{4 + \text{Cos } \overline{K-k} + \text{Cos } \overline{E-\varepsilon} - \text{Cos } \overline{K+k} - \text{Cos } \overline{E+\varepsilon}}.$$

Digitized by Google

This has been drawn assuming that $S\sqrt{\frac{L}{l}} = s\sqrt{\frac{l}{L}}\cdot\frac{R}{L} = \frac{s}{Q+c}$ and $r/l = \frac{s}{P+c}$ for a transformer with the value of $G/A = 0{\cdot}8$.

Sin $\varepsilon = 0{\cdot}1$ and Sin k is varied from a value -1 through zero to the value $+1$.

It will be noticed that the value of $Vs\sqrt{\frac{L}{l}}$ is zero when Sin k = Sin $\varepsilon \frac{G}{A+\sqrt{A^2-G^2}}$ so that if sin ε has appreciable value it will be more profitable to make Sin k negative, as a general rule.

The Valve Oscillator.

The solutions of the general case of the valve oscillator which has inductance in the grid and plate circuits and mutual magnetic coupling as well as capacity coupling between these two electrodes, is a particular case of the solution of the previous portion of this paper, in which the internal electro motive force V of the conductance s has the value $-mV_1$ where m is the so-called valve magnification factor, and the capacity c is the capacity between the grid and anode.

The differential equations for currents in this circuit are

$$(8)\ [1+(R+LD)(S+\overline{Q+c}\,D)+(r+lD)(s+\overline{P+c}\,D)-2McD^2+[(R+LD)(r+lD)-M^2D^2][(s+\overline{P+c}\,D)(S+\overline{Q+c}\,D)-c^2D^2]+ms[MD+cD[(R+LD)(r+lD)-M^2D^2]]]i_1i_2=0.$$

Using the notation of the earlier part the resonant frequencies are determined from the solution of the equation

$$^1/_{A_1}w^2 = 1-\text{Sin } k \text{ Sin } \varepsilon\, {}^G/_{A_1} \pm [(1-\text{Sin } k \text{ Sin } \varepsilon\, {}^G/_{A_1})^2 - \text{Cos}^2 k \cos^2 \varepsilon\, {}^{G^2}/_{A_1^2}]^{\frac{1}{2}}$$

The small losses terms are

$(R\overline{Q+c}+LS)(r\overline{P+c}+ls)+(Rl+rl)msc.-(Rc-Ms)(rc-MS)$ and are those of the earlier case with the addition of the terms $(Rl+rL)msc$.

The conditions under which the system will oscillate are determined from the solution of

$$(9)\ \left[S(1\pm\text{Cos }\overline{K-k}) + \frac{R}{L}\overline{Q+c}(1\pm\text{Cos }\overline{E-\varepsilon})\right]\sqrt{\frac{L}{l}} + \left[s(1\mp\text{Cos }\overline{K+k}) + \frac{r}{l}\overline{P+c}(1\mp\text{Cos }\overline{E+\varepsilon})\right]\sqrt{\frac{l}{L}} + ms[\text{Sin } k \pm \text{Sin } K] = 0.$$

Remember that the coefficients $1\pm\text{Cos }\overline{K-k}$ and $1\pm\text{Cos } E-\varepsilon$ are associated with the conductances $\left(\frac{R}{L}\overline{Q+c}\right.$ is called a conductance) of the circuit having the greater value of the product of inductance and shunt capacity, so that as the equation (9) is arranged above the solution is for a grid oscillator.

An anode oscillator would have required these coefficients with the anode conductances.

Examining equation (9) in relation to the value of

$$\text{Sin } K = \frac{\text{Sin } k - \text{Sin } \varepsilon\, G/A_1}{[(\text{Sin } k - \text{Sin } \varepsilon\, G/A_1)^2 + \text{Cos}^2 k\,(1-G^2/A_1^2)]^{\frac{1}{2}}}$$

(*a*) It will be clear that if Sin $k=0$ and m and Sin ε are sufficiently large the system will oscillate in the "sum mode."

(*b*) If there is magnetic coupling also and Sin k is negative the system requires smaller values of m and, or Sin ε to support oscillation in the "sum mode."

(*c*) If Sin k is made positive and so small that Sin k + Sin $K = 0$ then Sin k — Sin $K > 0$ and the system is incapable of oscillation in either the "Sum" or "Difference" Modes.

(*d*) If Sin k is made positive and greater than Sin $\varepsilon \frac{G}{A-\sqrt{A^2-G^2}}$ the term Sin k — Sin K has a negative value, and if m is sufficiently large the system can oscillate in the "Difference" Mode.

Returning to case (*c*) the capacity coupling factor Sin ε is neutralised, and the system is stable if Sin k is positive and between the values.

$$\text{Sin } \varepsilon\frac{G}{A-\sqrt{A^2-G^2}} \text{ and Sin } \varepsilon\frac{G}{A+\sqrt{A^2-G^2}}.$$

If the products $L\overline{Q+c}$ and $l\overline{P+c}$ are equal $G=A_1$, less the "small losses terms" only and the adjustment is critical.

The expressions given in the foregoing pages are very general and include all sorts of devices that are not classed in the ordinary way as transformers. Tuned chokes, of course, come into this category and although both transformers and oscillators can be made more elaborate than the examples analysed a little rational guessing will reduce them to these forms.

I have to thank the Director of Artillery for his permission to offer this paper for publication.

BOOK REVIEWS.

Die Stromwendung grosser Gleichstrom-maschinen.

By Dr. L. Dreyfus. (Berlin: Julius Springer.) Pp. xii+191. Bound, 17.5 marks.

It is unusual at the present day to see a new treatise on commutation. Despite its shortcomings, the classical theory proved more than enough for many designers; while the more earnest inquirers keenly felt the difficulty of submitting actual conditions to mathematical analysis. The flux oscillations set up by the teeth and the variableness of the brush contact introduced troublesome complications. On the other hand, the universal introduction of commutating poles rendered undue anxiety about commutation superfluous. Having placed the sparking limit beyond the heating limit, the designer felt that his chief care had been removed.

Of recent years, however, no writer has been more active than Dr. Dreyfus in seeking a new orientation of the problem. As he states in the preface, the limitations of the classical theory become apparent to the designer of large d.c. machines, and the difficulties are keenly felt when the limits of such machines are approached. While contented with a close approximation, the author pleads for clearness in understanding the problem and in calculations connected therewith. Among the shortcomings of the older theory, the author mentions: the assumption of a stationary armature field without clearly defining the equivalent steady field assumed to be cut by the conductors; the parts of the leakage field are not clearly defined and calculated; a straight-line commutation curve is assumed, although conditions render this impossible in many cases; the method employed for calculating the requisite commutating field for straight-line commutation is inaccurate. These are some of the gaps that the author tries to fill, or problems he attempts to solve.

The treatment is limited to large units—e.g., 6 000 kW, 12 000 A, 250 r.p.m.—so that the armature windings include only single-turn lap windings with a small number of conductors per slot. This restriction, however, is one for which most readers will be thankful. While the book is essentially for advanced students and designers, it may be stated that the treatment, though mathematical, is not in general difficult. The results are not only given in a usable form, but examples are worked out to illustrate their application. Though the number to whom this work may appeal is relatively small, we feel that the gratitude to the author of those who digest and utilise the results of his labours will be proportionately greater.

S. Parker Smith.

Engineering Electricity.

By Ralph G. Hudson. (London: Chapman and Hall.) Pp. viii+214. 12s. 6d. net.

This is a second edition, and, though written primarily for technical students not specialising in electrical engineering, it forms a brief introductory course for electrical engineering students. As the course is designed to develop the reasoning power of the student rather than to encourage the accumulation of disconnected facts, descriptive matter is only included when it is desired that the student shall visualise the practical devices which illustrate applications of the fundamental principles. The general principles of electricity and magnetism most frequently applied in engineering practice are dealt with, but space limitations preclude consideration of the principles of electrochemistry, illumination, electrostatics, and the wireless propagation of energy.

MODERN ADVERTISING.

New Publicity Methods which should Assist in Developing Sales—Advertising Domestic Electrical Appliances through the Schools—International Selling Problems.

WE give below a short account of some of the papers read at the 25th World-Convention of the International Advertising Association in Berlin :—

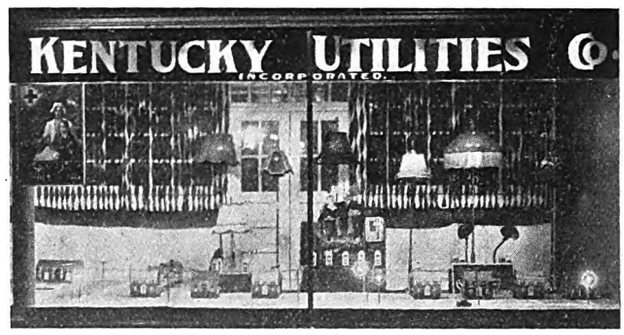
Mr. BERNARD LICHTENBERG, in an informative paper on co-operative advertising, emphasised that there are limits to the individual advertiser's ability to get results. His individual efforts, he said, were subject to diminishing returns, and his experiments tended to overreach and fail. A thousand factors beyond his individual control tended to submerge his individual efforts. He asked whether the facts beyond the control of the individual advertiser could not be controlled through co-operative effort to the end that he would get more out of his advertising appropriation. Advertisers in America, he said, had long seen the need for the creation of an organisation whose word on the circulation of publications would be accepted beyond the question of doubt. The result was that the Audit Bureau of Circulations was created. The Association of National Advertisers in America had been active in various moves to eliminate waste through the standardisation of various advertising materials and methods. Getting the most out of advertising appropriation meant, to advertisers, conveying information as economically as possible to the buying public. To the buying public it meant obtaining this information as economically as possible. The interests of advertisers were, therefore, in common with the buying public. It was up to individual advertisers to originate or inspire progressively improved means of furthering these interests.

Mr. J. F. RITCHIE said we heard a great deal of talk about the co-operation between the sales management and the publicity management, but he had come to the conclusion that this was all a myth, and that the sales management was possessed of only one endeavour; namely, to control. They were existing under the hallucination that they were selling the goods, when, in reality, they were simply supplying the demand which had been created by the publicity fraternity. It was the difference between supplying a demand and creating a demand that was the stumbling block throughout the whole movement of industrial publicity. To him, nothing seemed so terrible, so appalling and disastrous as to think that a publicity campaign—organised, created, tended with great care—was submitted to the sales management, which pulled to pieces everything that would sell the goods, and then said that what they wanted and what they were going to pay for was so and so. What they required was a stronger organisation on the part of the advertising profession to deal with industrial advertisements and to combat the overwhelming control passion of the sales management.

School Demonstrations.

Dr. WERNER DORN said that advertising had for its object, among other things, to make the public acquainted with various articles, and to convince them of their value in use. This object could, he said, in the case of very many articles, also be fulfilled by education in the school. For example, an electric immersion heater could be demonstrated in all well-organised schools and its advantages pointed out. Such demonstrations had an advertising effect, and they were in many points superior to other forms of advertising. The attention need not be directed by expensive means to the object; what was taught in the schools reached the knowledge of everyone. By its educational methods, the school had the best means for clearly and convincingly showing the uses of an article. The scholars, he said, were quite free from prejudice towards these representations. On the other hand, the scholars only came into question as buyers years later, so this meant working for the future.

"With all advertising work during education the interests of the school must be safeguarded." He added, "These considerations suggest the following questions: (1) What can the school do within the limits of the advertising work of our modern economic life? (2) What methods must it adopt for that purpose and what means must be used? (3) What can economic forces do in conjunction with school experts in order to promote advertising work through the school? The school can, during object lessons, discuss devices and machines for saving time, power and money, for the household, for industry, etc., and call attention to their value. During arithmetic lessons, when data are available, it can determine the amount of such savings. Certainly everyone, even without any calculation, will know that with a sewing machine a good deal of time is saved, but the conceptions as to the amount of these savings are very vague. By calculations these misconceptions are cleared up. If, therefore, the school trains the future consumer in an exact valuation of articles for use, this may result in increases of sales and facilitate advertising by producers. In this sense electric lighting and heating, electric cooking apparatus, electric boilers and vacuum cleaners, petroleum ovens, devices for boiling down and thickening, washing and cleaning machines can be discussed. Rationalisation in the household may be systematically dealt with in education. In domestic schools a good deal is already done in this direction, but it is necessary that it should be done in compulsory schools. By such discussions, the entire rising generation will come to be interested in such innovations, and will also be interested in that which gives information about them, in advertising. By such training of critical buyers, many an article which will not withstand careful examination and judgment will undergo a falling-off in its sales, but a far-sighted firm cannot regard this as an evil. If the school succeeded in initiating youth into the true understanding of such data, then this would furnish a guarantee that the consumer would also adopt the right attitude towards them, and thus a basis of mutual understanding would be created.



One of a series of window displays in which a supply undertaking advertised its service to the public. In this picture is seen a miniature representation of local street lighting.

How the Housewife Helps in America.

Mrs. CHRISTINE FREDERICK said: "Advertising, as we regard it in America, is a labour-saving form of transportation, somewhat like radio, which brings the opera and the concert into the home. We regard even any talk about its necessity or value as nonsense. Naturally we do not want to see it used extravagantly, or to make prices high, but by this time we are educated to know that wide publicity means cheaper manufacturing cost. Mrs. Consumer in America works very closely with manufacturers. She writes letters to home-service heads employed by the manufacturer, and secures a woman-to-woman reply. She attends household lectures and secures free education. She is supplied with general household information, recipes and housekeeping aids that are only indirectly connected up with the manufacturer's product. She is asked for her opinion both before a new product is put out and afterward; she is offered prizes and rewards for participating in the improvement of the product and the widening of its scope and usefulness. She is given information in the newest developments, told promptly of new inventions, and is offered through reduced prices, made possible by mass production, a dividend share in the patronage she supplies."

Mr. H. G. HART, managing director, Lever Brothers, dealing with international problems of selling, said the problems which met the international advertiser differed as widely as did their solutions. Each individual country was in a different stage of advertising history, and the advertiser was bound to study each problem afresh and with an eye to the stage of development in which he found the country he was tackling. There was an underlying and guiding principle, capable in every case of abstraction, of clear definition, and if he was wise he would not enter into a publicity campaign until he had provided himself with skilled advice. It was beyond question that the practice of advertising to-day was a highly complex thing. From being purely an art, and subject to no other tenets than the whim and fancy of the practitioner, it might now be more accurately described as a science, and in its practice they might consider themselves entitled to look for definite results, flowing from a definite policy and action.

THE DOMESTIC CONSUMER.

How American Electrical Manufacturers Cater for the Market—Novel Forms of Appliances—The Decorative Use of Coloured Bakelite.

[FROM A CORRESPONDENT.]

ALTHOUGH I have recently returned from a tour of America, during which I have seen domestic appliances which would be welcomed over here—if only they were available—it must not be thought that I am in favour of the Americanisation of the British electrical appliance-manufacturing industry.

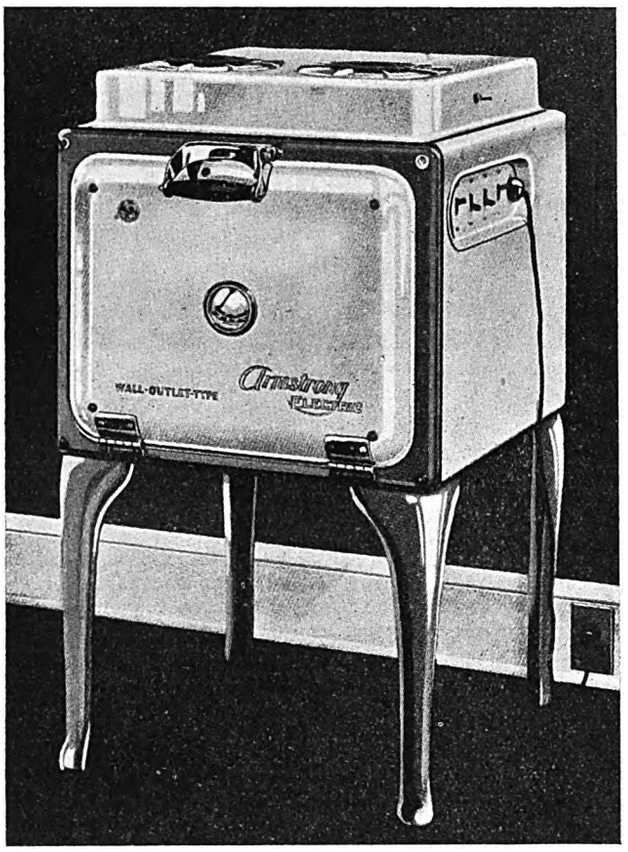

Fig. 1.—A portable type electric cooker requiring no special wiring which is finding favour on the American market.

Perhaps it may be counted in my favour that I draw attention to the fact that I possess a bowl heater of American origin which is provided with a lampholder adaptor which has only 6 ft. 6 in. of flex between fire and lighting point. As my lighting points are outside this range I was faced with the alternatives of fitting a new length of flex—the existing flex being too thick to correspond with any commonly used in this country—or of standing the heater upon a table. In fairness to British manufacturers I should add that this was the case until a Birmingham firm introduced a plug-cum-lampholder fitting which permitted the plugging-in of my fire to a wall plug.

But while I have no bias in favour of American apparatus I am bound to acknowledge that American manufacturers have gone further than we have in the design and manufacture of domestic electrical appliances that give real, and in some cases, novel service to the housewife.

At the present time electrification in this country is not sufficiently advanced to warrant the marketing of some of the special types of appliance seen in the U.S.A., but there is not the slightest doubt that there will shortly be a tremendous market here for appliances of the kind which I am about to describe, and that American progress in a field in which our own experience is so slight cannot fail to be of general interest.

It is, of course, realised that conditions in the two countries are vastly different, and that a good deal of the impetus towards the production and exploitation of new energy-consuming devices in the U.S.A. arises naturally from the need of many of the electricity suppliers to sell their product; whereas in England it is often difficult for the supply of energy to keep pace with the demand.

With hundreds, and perhaps thousands, of potential consumers unable to obtain a supply, in spite of the hopes held out for the national schemes, it is not surprising that electrical manufacturers have not developed the domestic appliance business so thoroughly as have the American manufacturers. The opportunities here are tremendous, but it will be some years before we are ready to go ahead in every department of domestic appliance utilisation.

It may be of interest to those who contemplate the development of domestic apparatus on larger lines to have a brief account of the types of apparatus used in the United States, and special points in its design.

One is naturally impressed by the remarkable variety of models of American domestic equipment. There seems, in fact, to be so much from which to choose that the customer must often experience difficulty in making a decision on the machine to buy.

Colour Schemes for Washers.

Of electric washers alone there are many different makes. The tendency to make this equipment attractive to look at is very pronounced in American electric washers, and some remarkable colour schemes are to be seen.

One machine has a polished copper tub with a plated rim, while the remainder of the body and the wringer are finished in two tones of green lacquer. Green is a popular finish colour on American washers. It is used on a rectangular model with heavy pressed aluminium tub, and on another with a copper tub, nickel plated inside, and provided with a red lacquered lid.

Colours are not, however, universal, and one prominent firm is concentrating on the production of washers with a porcelain finish. Whether or not the American housewife's love of colour in the kitchen will find a porcelain finish acceptable remains to be seen. This restrained note seems eminently suited for the British market, where it would doubtless command greater favour than the more exotic finishes.

On the constructional and operational side American electric washers have some interesting points. One type, which has its motor and drive concealed beneath the tub, employs an agitator which can be inverted; with the agitator disc placed downwards the washer is ready to deal with a small wash, and the reverse position is used when there is a tubful to wash. The sides of the tub are slightly curved to facilitate removal of the clothes.

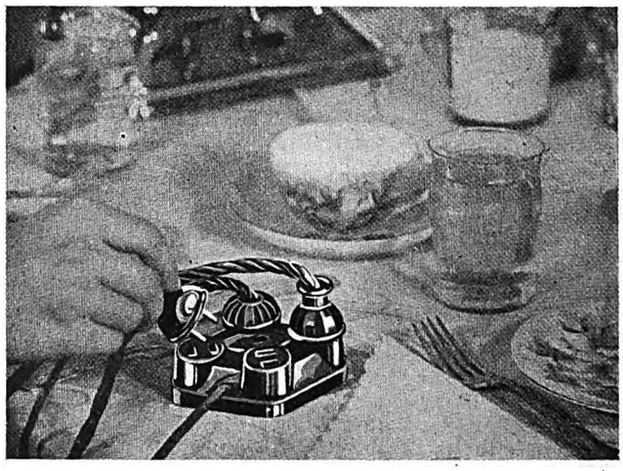

Fig. 2.—A "table tap" which permits four electrical appliances to be used at the meal table, without a maze of trailing flex.

To meet the demand for a combined washer and centrifugal dryer one firm has produced an interesting model. A modern centrifugal dryer takes the place of the wringer normally used. It accommodates a full load of clothes and "damp-dries" them in three minutes. Each piece comes out of the dryer in a soft and fluffy condition and evenly dried.

Digitized by Google

Emptying of the washer tub is done electrically by means of a small pump which forces the water out of the tub up to an adjustable draining board and suitable run-off means.

Portable washers are also being developed for use in small houses and flats. One model, retailing at less than £9 10s., and capable of being used on the kitchen draining board, and of being stored under the sink when not in use, employs a new washing principle. It has a domed top in which are fixed a motor and a fan. This rapidly draws the suds and water up and down through the clothes. No paddles, cups or agitators are used to come in contact with the clothes.

Another portable type operates on more conventional lines. It washes and dries clothes by a spinning process, and therefore has no wringer; and all its mechanism is enclosed.

In the electric cooker field, too, there is a good deal to be learnt from current American practice, though many features that are acceptable to the American housewife would not find favour here, either because of price or of the difficulty of finding room to accommodate some of the large table models.

As regards finish there is the same love of colour, such shades as "sunshine yellow" and "nile green" being as popular as the more utilitarian-looking white and grey, white and black, or plain white.

Most of the American cookers are provided with three hotplates—a tendency which is gradually introducing itself into British cooker design—and some have four or more plates. Temperature and time control equipment is generally provided. Other features to be found on new models include load balancing switches, and, on some of the table models, a built-in kitchen heater.

A cooker novelty is a comparatively small sized cooker operating from any wall socket, which is claimed to be capable of cooking a meal for ten people. This cooker, which is illustrated in Fig. 1, is 40 in. high, 23 in. wide and 26¾ in. deep. It is fitted with 600 W reflector-type elements, an oven temperature indicator, and has a large warming shelf behind the two top heating elements. The finish is white enamel with grey enamelled edges and legs, and the appliance retails around £20.

New Cooker Features.

Several features new to electrical cooking are introduced in a device 21 in. high, 11 in. wide and 14 in. deep, having an enclosed vertical boiler with double heating elements, which operates on a principle of reflected as well as direct heat, and this lessens considerably the time needed for cooking. Two doors in the front close in the two vertical heating elements and the removable grill. On top of the cabinet is a hot-plate, and below is a small drip drawer. A four-section aluminium steamer is provided for use on the hot-plate. The removable grill is adjustable, so that it will accommodate the thinnest slices of bacon or a 3 lb. chicken, and is large enough to hold 12 chops. One of the heating elements is stationary, while the other may be moved backwards or forwards by turning a small knob in the base of the stove, thus making it possible to bring both the heating elements into direct contact with the meat or other food-placed in the grill. The two heating elements of the boiler are loaded to 1 320 W and the loading of the hot-plate is 660 W. The construction is such that the boiler and hot-plate cannot be used simultaneously. The device has two-heat control and may be operated from the ordinary lighting circuit. It sells at about £9.

Another interesting device is an automatic table timer, which consists of a variable timing mechanism, a cord and plug for attaching to an ordinary electric outlet, a non-automatic electric outlet and an automatic electric outlet. Appliances plugged into the automatic outlet may be controlled for periods of two to twenty minutes, depending upon the position of the "time adjustment" lever which moves over a scale graduated from 1 to 5. By the use of this outlet, coffee, for instance, can be percolated the same number of minutes every day. For operation, the time adjustment lever is set in the desired place and the automatic current switch is pushed over to the left as far as it will go, thus making electrical connection. At the end of the period, the switch will snap off, opening the circuit. The switch may be thrown off by hand before the end of the time period if desired. The non-automatic outlet will accommodate an appliance while the automatic outlet is in operation, thereby giving the service of a twin outlet.

A refinement noticed in one make of iron is a dial indicator situated on the base of the handle, and when turned to "silk," "cotton," "wool" or "linen," marked on the face of the dial plate, gives the correct ironing temperature for the material that is being ironed.

The extension of colour to such utilitarian objects as plugs and sockets is another development worth noting, and the decorative possibilities of coloured bakelite mouldings have to be seen to be appreciated. Beside the use of colour, these accessories are assuming new shapes which are not only more agreeable to the eye, but, by their capacity for fitting the finger tips and being easy to push or pull, make easier the use of the electrical appliances with which they are employed.

The "Table Tap."

There is also a new connector for irons, kettles, etc., which accommodates appliances with round flat or tapered prongs; and a multiple convenience outlet (depicted in Fig. 2) for use on the dining-table. This "table tap," as it is called, is made of bakelite in attractive colour combinations. It greatly facilitates the preparation of electrically-cooked meals at the table, as it does away with the necessity for a variety of unsightly lengths of flex trailing across the floor to their respective wall sockets. The "table tap" is connected up to one conveniently-placed wall socket, and four appliances can be plugged into the moulding where it stands on the table.

Incidentally, before leaving the question of wiring and accessories, mention may be made of a new type of snap or surface tumbler switch, the cover of which snaps on without any screwing. It makes a very neat job.

In the ventilating field new developments include lighting fixtures incorporating built-in fans. The fan portion, which is, of course, hidden within the lighting unit, is of similar general construction to the ceiling-type fan, but the blades are of special formation, and of only 12 in. diameter. In spite of the small diameter this type is said to be capable of circulating 50% more air, watt for watt, than a 16 in. desk-type fan. An advantage is that, instead of creating a direct blast of air, this fan draws the cool floor-air upwards, and circulates it around the room.

There is also on the market a slow-motion "airator," a pedestal device on which is mounted a globe-shaped cage, inside which large blades revolve slowly, thus circulating the air without causing undue draught.

A modification of the industrial-type exhaust fan is also being developed for domestic applications. It is very easily installed. The fan frame fits the window like a screen, but, unlike a screen, it creates a steady and very effective suction. This appliance is also available in a box made to fit walls of varying thicknesses. This 12 in. fan can be installed in walls as thin as 5¾ in.

Among small domestic appliances is a pair of small electric heating pads for use on eyes, ears, face, or wherever a small local heat application is desired. The pads, which are soft and pliable, and covered with fluffy eiderdown, are thermostatically adjusted to the correct temperature for eye application, but pads set for higher temperatures are also available.

A Phenomenal Development.

One of the most phenomenal developments in the American appliance field is the health exerciser, which is selling in large numbers throughout the States. One or two makes of electrical exercisers are on sale in this country; but the American market is embarrassed with the quantity and variety of different makes on offer. I have personally counted at least nineteen different types of health machine, and each one of these is being marketed with the aid of large advertising appropriations.

Emphasis is laid on the health value of the massage which these handy machines provide, and people have been instructed how they can be independent of the weather for their exercise.

When this appliance was first introduced, its appeal was mainly to athletic clubs and gymnasia and to the portly society matron. But with the spread of the health exercise idea the average middle-class family has become the biggest potential user. These devices are usually equipped with ¼ H.P. motors, and incorporate a device for adjusting the number of pulsations per minute according to the purpose for which they are required. The motors are usually of the universal type, and run at about 1 700 r.p.m., but the speed is reduced in the vibrating arms to about 625 r.p.m. As it is considered logical to attempt to sell ironers with washing machines, enterprising electrical traders in America sell sunlight lamps with the health exerciser—a plan which seems to work out satisfactorily.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Concrete Pole Designs and Costs."

[To the Editor.]

Sir,—Replying to the comments by Mr. W. Fennell, printed on page 224 of your issue for August 23rd, I have to say that the machine-made reinforced concrete pole is not condemned. The reasons are given why it cannot very well compete in total costs *in place* with the pole mentioned.

Incidentally, the writer would suggest that the compound word "ferro-concrete" be dropped. The word "concrete" is universally used, but the word "ferro" is of Latin origin, and means iron in English. Let us speak English in England.

As with steel, the reinforced-concrete pole is a manufactured product (not grown like the wood pole); design figures and tests and process practices may be found necessary to satisfy different understandings of obscurity. The design strengths of the poles to meet the loadings, etc., imposed can be sufficiently checked by the steel and concrete material quantities and dimensions given. The design and configuration cannot be shown here for patent and commercial reasons. The best assurance available is that the writer will guarantee to build the reinforced concrete pole line referred to, in strict accordance with Regulations as to minimum clearances, loading conditions and factors of safety, for the costs mentioned on page 103 of The Electrician for July 26th last. The writer also confirms all the questions given by Mr. Fennell in his penultimate paragraph, so that his final paragraph is nullified.

Regulations provide for a factor of safety of 3·5 for steel and concrete; all the designs given by the writer conform to this factor. However, the writer maintains (as will every engineer familiar with reinforced concrete construction) that concrete should have a higher factor of safety than steel. To meet this condition, the writer proposed a value no higher than 2·5 for steel, and around 4·5 for concrete.

Steel, or reinforced concrete, poles are not ordinarily or primarily intended for short-span construction which, incidentally, is only one of the reasons why the line, and not the pole, should be considered. We need only consider the relative pole and/or line material annual expenses to see that, when comparing a construction with heavy annual maintenance costs and another without annual maintenance costs, the pole line is the true and proper basis of comparison.

In this country the skill in design and construction of reinforced concrete pole lines may be in its infancy. We all have different conceptions of the full meaning of infancy. For instance, the writer likens it to the once common belief (not yet 10 years old) which made it quite positive that the manufacturers of this country could not possibly compete in the 100 000 V transformer and power transmission fields. We certainly know better. They were grown up—simply waiting for the opportunity.—I am, etc.

William T. Taylor.

August 24th.

"Where *is* that Battery?"

[To the Editor.]

Sir,—The letter in your issue of August 16th signed "Battery Electric" refers to a matter which deserves concentrated attention on the part of the battery makers. Admittedly the solution of the problem is beset with what appear to be enormous difficulties, both chemical and mechanical; also economic, since the range of suitable, i.e. reasonably inexpensive, materials is decidedly limited. Apart, however, from this aspect of the question, it would appear that those who possess the knowledge to tackle this type of research do not also possess the means or the incentive, whilst those who have the means are too busy making and selling normal lead and alkaline batteries to bother about the future.

On a number of previous occasions I have suggested that if the B.E.A.M.A. would offer a very large prize—say, £100 000—for half rights in a 40-watt hour per pound cell, which proved on test to be reasonably cheap and durable, this would inspire electro-chemists all over the world to get down to the job in earnest. There has been much newspaper talk concerning a new cell from the Irish Free State, which country—although at present one of the least industrialised in the world—has had the pluck to back its judgment by giving the inventor £5 000 for a half share. This is the right way to do things, and should inspire others to follow suit.

What about the possibilities of the manganese dioxide cell, with some metal of the zinc group as negative active material? The MnO_2 would be reduced to Mn_2O_3 on discharge, and would be practically everlasting. It could be mixed with graphite to improve its internal conductance.

There are several metals of the zinc group which are becoming commercial, for example, beryllium, the lightest known metal except lithium; also boron, which can be alloyed with aluminium. Don't forget that sixty or seventy years ago aluminium was about £50 per lb.; now it is about a shilling!

I hope that when Mr. Drumm of Dublin is free to publish his results The Electrician will be the first journal in England to receive his confidence.

Do not let us forget that, so far, electrical engineers have not fully delivered the goods where road transport is concerned. All commercial vehicles and most automobiles will in the long run be pure electrics. Some will be engine-cum-battery vehicles, but that does not affect my main contention that the technical workers in the accumulator world have exhibited symptoms of too much pessimism and far too little real striving after improvement.

In saying this I do not for an instant belittle the knowledge of the leading technicians in the existing battery industry, but I am sure they could do much better if they really tried.

The first step is the international announcement of that £100 000 prize. Remember there is no financial risk in such an offer, and the results might be epoch making.—I am, etc.,

Raymond J. Mitchell.

August 27th.

A NOTABLE "TALKIE."

First Repetition in London of a N.E.L.A. Convention Speech.

The first notable use of the talkie outside the entertainment field was that made by the National Electric Light Association of America when it obtained talking films of distinguished men in other countries, rushed the films over to the States, and reproduced them as part of the business programme at their annual convention at Atlantic City in June. Speakers whose voices were heard in this way included Sir Ernest Benn (chairman of Benn Brothers, Ltd., proprietors of The Electrician), Signor Pirelli, and Mr. T. A. Edison.

At the London offices of the Western Electric Co., on Tuesday, some of these sound films were given their first public showing in England before a party which included Mr. J. H. McGraw, chairman of the McGraw-Hill Co., proprietors of our American contemporary, the "Electrical World."

Mr. P. L. Thomson, director of public relations of the Western Electric Co., pointed out that these films represented the first employment of the sound film by an industry. By obtaining sound film records of abstracts of papers actually read at the Atlantic City meetings, they had secured a complete record in abstract of the whole Convention. The abstract films were arranged to be shown in conjunction with those of Sir Ernest Benn and others, the whole making a two hours' programme; the actual meetings occupied four days. Copies of this vocal record of the conference were now being shown to electrical associations and other bodies all over the United States.

Mr. J. H. McGraw, who had heard the speeches reproduced at the Convention, testified to the remarkable effect produced by them on the American delegates, and predicted that the "sound picture" would become one of the greatest factors in promoting good international feeling and understanding. Sir Ernest Benn's speech on "Private versus Public Ownership of Property" appealed particularly to his American audience.

Mr. Pelley, assistant general manager of the Western Electric Co., explained that while the obvious application of the talking film was in the entertainment field, its possibilities in other directions were endless. It would enable the lectures and demonstrations of great scientists to be reproduced in detail before students all over the world. In the same way the technique of an eminent surgeon conducting an operation would be made clear to thousands of medical students who would not otherwise receive such expert tuition. Religion and advertising would also benefit greatly.

At the conclusion of the demonstration, Mr. P. L. Thomson, on behalf of the Western Electric Co., presented to Sir Ernest Benn the sound-film of his address to the N.E.L.A. Convention.

NEWS IN BRIEF.

Electrically-operated Doors at Bank of England—Blackpool's Illuminations—A Museum Loud Speaker—Electric Timing for Schneider Trophy Race—More Employment in Electrical Industry.

A mess room is to be erected at the Portsmouth electricity works at a cost of £560.

The new electrically-controlled clock in the reconstructed town steeple at Falkirk is now in operation. The clock is worked on the " Pul-syn-etic " system.

The Barnsley Medical Officer has reported a gas leakage at the tuberculosis dispensary, and has been instructed to report as to the installation of electricity.

It is reported that representatives of the American Telephone and Telegraph Co. have completed the purchase of a site at Frenchport, on the Mullet peninsula, in Ireland, for the landing place of the European end of a transatlantic telephone cable which the company proposes to lay.

The electrical mechanism which was, in the first place, installed temporarily in the organ of St. Paul's Cathedral, London, is to be retained. It is stated that it comprises three hundred miles of wire.

Electric lighting is to be adopted in Norton-juxta-Kempsey (Worcestershire) Church, and a successful fête to raise the money to pay for the installation took place on August 15th in the grounds of the vicarage.

A proposal that Sculcoates Board of Guardians should establish its own electric light and power plant at the institution has been referred back. Mr. J. N. Waite, the Hull city electrical engineer, is to be given an opportunity to submit comparative figures for a supply by the Hull electricity department.

In the reconstructed Bank of England, vault doors weighing 12 tons each will be manipulated electrically, and the electricity for lighting the vaults will be received from three distinct and separately controlled sources.

The Standing Committee of the Board of Trade, under the Merchandise Marks Act, recommends that the following classes and descriptions of imported glassware shall bear an indication of origin at the time of sale or exposure for sale, both wholesale and retail, in the United Kingdom :—Illuminating blown glassware of all descriptions, other than electric lamp bulbs ; pressed glassware of all descriptions, etc. The Committee has also recommended the marking of certain imported scientific glassware (including tubing and rods).

Features in the Blackpool autumn illuminations will be an aeroplane carrying 200 electric lamps, which will fly over the town, and an illuminated yacht on the water at the South Shore open-air baths. The promenade illuminations will include arches, a windmill, and a crystal device of flashing lights. There will be 50 new illuminated stars and several new kaleidoscopes at various points along the carriage drive. About 5 000 lamps will be employed on each pier, and the total number used will be over 100 000. The illuminations will continue from September 21st to October 21st.

A logarithmic loud speaker horn, measuring 27 ft. in length and 7 ft. across the mouth, designed by Mr. R. P. G. Denman, has been installed in the Science Museum, South Kensington, London. It is intended to be used in connection with the daily auditions of broadcasts from local wireless stations. It is stated that, with a driving unit powerful enough to create the sound waves, this horn will be capable of reproducing notes of frequencies ranging from 32 up to about 6 000. After measurement of the sound pressure developed for all musical frequencies, a suitable amplifier will be made by the Museum authorities.

Seaham Harbour electricity department has purchased electric irons at 10s. each, for issue to prepayment consumers.

The August issue of " County Pie," just to hand, is as well-produced and as entertaining as usual, and its frontispiece is a portrait of Mr. F. J. Rynd, the supervisory engineer of the County of London Co.

Sir Joseph Ward, premier of New Zealand, referring to the British cables and wireless merger, said, in the House of Representatives, he thought the British Government made a huge mistake in giving up its superior interest in the beam system to enable the Eastern Telegraph Co. to become part proprietors with them.

Glossop Corporation has authorised an electrical installation in the markets.

Glasgow Electricity Committee has asked the electrical engineer to report further regarding the question of instituting a charge for installing cookers, radiators, and hired water-heaters.

New stores, workshops, and office extensions are being constructed by Burnley Electricity Department, on land vacated by the Gas Department, and adjoining the existing electricity offices. The new premises will be ready for occupation at the end of the year.

Glasgow Corporation Wages Committee has agreed to increases of wages of blacksmiths and hammermen in the tramway works to 1s. 6½d. and 1s. 3d. an hour respectively, but has refused an application by the A.E.U. for an increase of 2d. per hour for the fitters in the works.

Mr. J. Rowan, general secretary of the Electrical Trades Union, states, in his monthly notes to the members, that the efforts of the Union to get the Institution of Electrical Engineers to interest themselves in the question of securing the registration of sea-going electricians, have been unsuccessful. The Council of the Institution state that, having regard to the recently reiterated attitude of the Board of Trade, the Council are of opinion that no useful purpose would be served by reopening the matter at present.

On the occasion of the trial flights of the supermarine Rolls-Royce S6 at Calshot last week, records were taken of flights by a special electrically-operated timing apparatus, which is a development of the camera-gun system used in the last Schneider race. The apparatus takes cinematograph pictures of the aeroplane at the rate of 20 pictures a second. In place of a stop watch which, under the old system, was photographed at the same time as the 'plane, electrical vibrations record numbers and make it possible to calculate the speed at which the machine is travelling to the hundredth part of a second.

The number of insured persons usually employed in electrical engineering was 79 770 at July, 1928. The percentage of such persons unemployed at June 24th, 1929, was 4·6, a decrease of 0·3 compared with June 25th, 1928, and 0·1 compared with June 20th, 1927. The insured persons usually engaged in electric wiring and contracting numbered 15 530 at July, 1928, of whom 7·7 per cent. were unemployed in June last, a decrease of 0·7 per cent. compared with June, 1928, and an increase of 0·8 compared with June, 1927. The number of insured persons normally engaged in electric, cable, wire and lamp manufacture was 86 180 at July, 1928, and the number unemployed at June 24th, 1929, was equal to 5 per cent., showing decreases of 0·6 per cent., and 2·5 per cent., respectively, compared with June, 1928, and June, 1927.

C

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated August 30th, 1879 :—*

More than 3 000 working men of Sheffield attended Prof. Ayrton's British Association lecture on " Electricity as a Motive Power."

A leading article advocated the adoption of electric lighting in mines.

* * *

TWENTY-FIVE years ago, THE ELECTRICIAN *dated September 2nd, 1904, stated that :—*

Wireless telegraphy was being employed for furnishing weather reports from Atlantic liners from distances up to 900 miles from land.

The Eastern Extension Co.'s new cable steamer " Magnet " sailed on her maiden voyage.

New submarine telephone cables were described in which an effort had been made to put into practice the principles " so long advocated by Mr. Oliver Heaviside."

* * *

FIFTEEN years ago it was stated in THE ELECTRICIAN *dated August 28th, 1914, that :—*

The foresight of the General Electric Co., in undertaking the manufacture of arc lamp carbons—carried on for twelve years at a loss—was seen to be justified, a supply of British-made carbons being immediately available for war purposes.

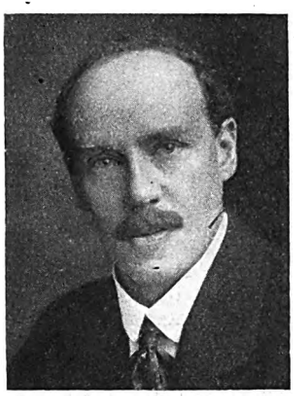
PERSONAL.

THE late Mr. Claude Wilson, M.I.E.E., of Old Queen Street, Westminster, S.W.1, left £2 502; net personalty £1 404.

Mr. J. S. Highfield added to his yachting successes by winning, with his 50-ton "Dorina," the handicap race at the Torbay Royal Regatta, on Tuesday.

Mr. W. A. Christmas, who recently retired, after 41 years' service, from the Hastings electricity department, was presented with a clock by the employees.

Mr. H. E. Yerbury, deputy general manager of Sheffield Corporation electric supply department, has been appointed chief totalisator engineer to Graham Amplion, Ltd.



Mr. H. E. Yerbury, appointed chief totalisator engineer to Graham Amplion, Ltd.

Mr. John Blackshaw, electrical engineer, has been adopted as Conservative candidate for Park Ward, Blackburn, at the forthcoming municipal elections.

Mr. H. H. Lancaster, traffic superintendent of the Blackpool tramways, has been appointed to a similar position at Leeds, at a commencing salary of £600 per annum. Mr. Lancaster succeeds Mr. A. Daggett, retired on superannuation, and will take up his new duties on October 1st.

Sir Alexander Roger, chairman of the Automatic Telephone Manufacturing Co., Ltd., and the Telephone Development Association has gone to Braemar for the deer shooting. The Derry portion of Mar Forest, which he has rented from the Princess Royal, covers about 20 000 acres, including some of the wildest scenery in Glen Lui.

Mr. James H. McGraw, chairman of the board of the McGraw-Hill Publishing Co., of New York, the proprietors of the "Electrical World," "Electrical Merchandising," and numerous other technical publications and books, has been on a short visit to London, following a holiday at Bad Nauheim, and preparatory to his return to the U.S.A. The faculty of New York University recently conferred upon him the degree of Doctor of Commercial Science in recognition of his many contributions to the advance of American business and science through the publications of the companies he has founded.

Mr. James Jeffery.

We have received from a correspondent the following appreciation of the late Mr. James Jeffery, whose death on August 6th was announced in our issue of August 16th:—

The late Mr. Jeffery was born on June 8th, 1854, and was educated at Victoria College, Jersey. Upon leaving school in April, 1870, he joined the staff of the Submarine Telegraph Co., at St. Helier, Jersey, as a telegraph clerk. After a little over two years' experience with that company's cables he entered the service of the India Rubber, Gutta Percha and Telegraph Works Co., Ltd., with which company he remained, directly or indirectly, until his death. After some service as assistant electrician on the c.s. "Dacia," and as senior clerk at the Lizard, he was appointed in 1874 to the charge at Marseilles of the Marseilles–Barcelona cable. In 1876 he became senior superintendent of the Direct Spanish Telegraph Co., Ltd., and was transferred from Marseilles to the Lizard. In August, 1879, he again joined the "Dacia" on the cable expedition between Marseilles and Algiers. He was in charge of cables between the Lizard and Falmouth, and between Las Arenas and Bilbao. On August 20th, 1883, he was appointed manager of the cable stations comprising the system of the Spanish National Submarine Telegraph Co., Ltd., and from 1886 to 1888 he was also manager of the Northern Division of the West African Telegraph Co. He was engaged in the laying of the Lizard–Bilbao 1872, Marseilles–Barcelona 1874, Marseilles–Algiers 1879, and Cadiz–Tenerife, Tenerife–Gran Canaria, Gran Canaria–Lanzarote, Tenerife–La Palmas and Tenerife–Senegal 1883–1884, cables. In 1896, 1903 and 1908 he represented his company at the International Telegraph Congresses held at Budapest, London and Lisbon respectively. In 1922 a presentation was made to him by the India Rubber Co. on completion of 50 years' service with them. He was a director of the Dumfries Electricity Supply Co., Ltd., until 1922, and chairman of the Ross Electric Light and Power Co., Ltd., and was also associated with other subsidiary Companies of the India Rubber Co., Ltd.

No nominations having been received from the general body of members of the Wireless Section Committee of Institution of Electrical Engineers to fill the vacancies which will occur on the Committee on September 30th next, those members nominated by the Committee are, under the Section's rules, elected. The Committee for 1929-30 will therefore be:—Captain C. E. Kennedy-Purvis, R.N. (chairman), the President of the I.E.E. (ex-officio), the Chairman of the I.E.E. Papers Committee (ex-officio), a representative of the I.E.E. Council, a representative of the I.E.E. General Purposes Committee, Lieut.-Col. A. S. Angwin (nominated by Post Office), Mr. R. H. Barfield, Mr. F. S. Barton (nominated by Air Ministry), Mr. F. W. Davey, Mr. A. J. Gill, Dr. J. Hollingworth, Captain C. E. Kennedy-Purvis, R.N. (nominated by Admiralty), Lieut.-Col. A. G. Lee, Prof. E. Mallett, Mr. E. B. Moullin, Mr. G. H. Nash, Mr. L. C. Pocock, Mr. C. E. Rickard, Commander J. A. Slee, Mr. P. K. Turner, and Major J. S. Yule (nominated by War Office).

OBITUARY.

MR. JAMES CARTMELL, for 25 years a member of the Blackpool Tramways staff.

MR. ALFRED CHARLES HOLLIS, aged 39 years, who has been since 1922 foreman of the Kalenite department at the works of Callender's Cable and Construction Co., Ltd.

MR. CHARLES THOMAS HANNA, an engineer at the Rugby works of the British Thomson-Houston Co., Ltd., on August 14th. He was born in Jamaica, and had been engaged at the B.T.H. Works for about 22 years.

MR. H. J. SCHIASSE, at Blonay-sur-Vevey, Switzerland. Mr. Schiasse entered the service of Callender's Cable and Construction Co., Ltd., in 1888, and was on the engineering staff of that company until his retirement in 1922.

MR. ROBERT MANN LOWNE, on August 17th, at his residence at Catford, London, S.E. Mr. Lowne was the inventor of many scientific and meteorological instruments, the Lowne electric clocks, the electrical wind vane, etc. He was 85 years of age.

MR. WILLIAM SHARMAN TOPLISS, on August 25th, aged 52 years. Beginning his electrical career in the municipal field, he held positions at South Shields, Sheffield, and Manchester, where he was assistant mains engineer. He next joined Ferranti, Ltd., and later went to the British Westinghouse Co., with whom he remained for some years. At the end of 1919, he went out to Burma for the Burmah Oil Co., and superintended a big electrification scheme for the company's oilfields. On resignation of his position with the Burmah Oil Co., he was retained in an advisory capacity. Mr. Topliss, who was a full member of the Institution of Electrical Engineers, and a life member of the Ex-British Westinghouse Association, is survived by his widow and one daughter. The funeral at Marylebone Cemetery, on Wednesday, was attended by some of his many friends in the industry.

MR. EDWARD B. CRAFT, on August 21st, in the forty-eighth year of his age. Mr. Craft entered the Bell Telephone System at 21 years of age and, at the time of his death, was executive vice-president of the Bell Telephone Laboratories, an organisation employing 5 000 persons in the prosecution of scientific and engineering research. Nearly every phase of telephony has, at one time or another, felt the stimulating influence of Mr. Craft's genius. Over seventy patents stand to his credit, and range from manual telephone apparatus to complicated circuit details of the dial telephone system, and from radio telephony to talking motion pictures. One of his best known contributions is the flat type telephone relay, which is fundamental to both manual and dial central office equipment, and which is now manufactured every year in many millions. Mr. Craft took a great interest in what might be called the by-products of telephone research, and the orthophonic gramophone, which has revolutionised the talking machine industry, as well as supplied one of the most important adjuncts of the talking motion picture industry, owes much to Mr. Craft's initiative and imagination. Mr. Craft was a fellow of the American Institute of Electrical Engineers as well as of the Institute of Radio Engineers. He was also one of the vice-chairmen in the National Research Council of America. In June, 1926, he was given the honorary degree of Doctor of Engineering by the Worcester Polytechnic Institute. A fertile imagination, an indomitable will and an amazing capacity for work were outstanding characteristics of the man.

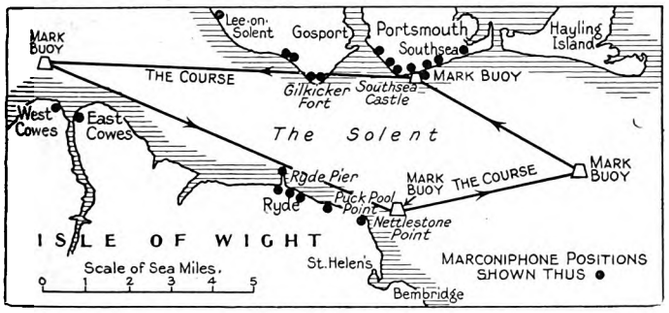
WIRELESS NOTES.

Marconiphone System to Relay Running Commentary on Schneider Cup Race.

THE Schneider Cup race on September 7th will be notable for the arrangements which have been made for broadcasting and relaying the running commentary, both to the crowds present and to the world. The gigantic installation of Marconiphones which is being prepared under the auspices of the Royal Aero Club is said to be by far the greatest ever carried out. Over two hundred of the most powerful loud speakers in existence will be distributed at nineteen centres along both shores of the Solent and on liners in the roadstead, and through these it is estimated that nearly a million spectators will be able to hear the special broadcast running commentary on the race, which will be received on standard model 44 receivers and raised to enormous volume by an unparalleled system of power amplifiers. An idea of the extent of the installation may be formed by a comparison with others provided in connection with recent events. At the Royal Air Force Display, Hendon, nearly 150 000 spectators were present, and approximately 60 Marconiphones were used; during the recent Catholic celebrations in Dublin 400 000 people followed services through 37 Marconiphones; political leaders during the recent election spoke over hundreds of miles to as many as 100 000 electors at a time, up to 60 Marconiphones being employed. These occasions are entirely eclipsed by the Schneider Cup installation. To supply power to the loud speakers 756 valves will be used, 694 of these being of the super power type. Their high tension requirements demand the provision of 392 Exide 30 V high tension accumulators and 168 large capacity 60 V h.t. batteries. Low tension for valves and loud speaker fields require 227 Exide accumulators. Two hundred and fifty coils of wire—over fifteen miles in all—will be used for connecting the various amplifiers



Map of the course of the Royal Aero Club Schneider Seaplane Race, showing positions of Marconiphones.

and batteries together, while the total weight of equipment exceeds twenty tons. The disposition of the points at which the commentary will be audible is shown on the attached sketch map. The shore stations will be at various points, numbering 19 in all, at Ryde, Nettlestone Point, Cowes, Gosport, Lee-on-Solent and Southsea. In addition to the Marconiphones, arrangements have been completed for the erection of a large event board at each centre, and the engineers in charge are installing 38 special telephone sets by means of which the speeds, times and other interesting figures may be posted up without delay.

Mr. J. L. Baird gave a demonstration, at the Baird Television Development Co.'s premises, Long Acre, London, last week, of the latest model of the televisor and of "telekies," a system for reproducing a film and a sound record simultaneously at a distance from the screen. A performance by Mr. George Robey was reproduced, and, although neither sound nor vision was perfect, the results were promising. Mr. Baird remarked that unless the B.B.C. came to a satisfactory arrangement for the transmission of television before the end of this year, he was seriously thinking of transferring his work to Germany, where he did receive official support.

The transatlantic telephone service is now available to and from all places in the Isle of Man and Northern Ireland (Belfast only), and the Irish Free State (Dublin only). Extensions in Northern Ireland beyond Belfast, and in the Irish Free State beyond Dublin, will be made as soon as circumstances permit.

A stockbrokers' office, seating 30 people, has been established in the Cunarder "Berengaria," and will receive prices continuously by wireless all the time the New York Stock Exchange is open, and transactions will be carried out for passengers by wireless.

CINEMA LIGHTING.

Interesting Electrical Equipment in a Glasgow Installation.

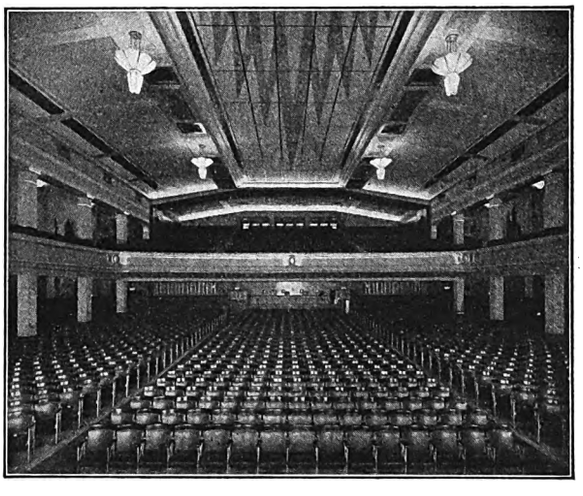
MANY new and interesting features have been incorporated in the lighting of the Tivoli Theatre, Partick, which is a good example of the combination of decorative art

THE stage and proscenium at the Tivoli Picture House, Glasgow, a good example of modern theatre lighting.

and lighting. Throughout the auditorium and on the stage, lighting effects in four colours are obtainable.

Four main lighting units are suspended from the ceiling over the stalls, these units being formed of double tier rippled glass panels, each housing 48 lamps in four colours. The illumination of the proscenium front is secured by means of a continuous reflector which extends the full width of the theatre, involving 280 20-W colour-sprayed lamps. Similar reflector lighting is provided for the organ grilles, and over the balcony.

For the general lighting of the corridors on either side of the theatre, below and above the balcony, four-light ceiling fittings have been adopted, each lamp being a different colour. Underneath the balcony three large ceiling fittings are suspended, each housing 16 100-W lamps in four distinct colours. Provision has been made for the illumination of the conductor's platform, which is formed of plate glass, trough



VIEW of the auditorium of the Tivoli Picture House, Glasgow, taken from the stage.

reflectors equipped with lamps in four colours being fitted in a compartment beneath the platform.

The electrical contractors were Messrs. Primrose and Primrose, Ltd., and the special electric light fittings were designed by the General Electric Co., Ltd.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

ALDERLEY EDGE AND WILMSLOW ELECTRICITY BOARD, August 30th.—Supply of 2 200 a.c. house service electricity meters. Particulars from Mr. E. Hesketh, Electricity Works, Alderley Edge.

MANCHESTER CORPORATION, August 30th.—Supply and delivery of one water-tube boiler superheater, for Barton power station. Continuous actual evaporation of boiler, 130 000 lb. of water per hour. Specification, etc., from Mr. H. C. Lamb, chief engineer and manager, Electricity Department, Town Hall, Manchester.

PLYMOUTH CORPORATION, August 30th.—Electrician's ironmongery, etc. Forms of tender from Mr. R. J. Fittall, town clerk.

WEST RIDING EDUCATION COMMITTEE, August 30th.—Electric light installation at Highfields School, Doncaster. Particulars from the divisional clerk, Mr. A. J. Dempster, 20, Christ Church Road, Doncaster.

Electric Refrigerator Contracts.

BURY AND DISTRICT JOINT HOSPITAL BOARD, August 31st.—Supply, delivery and installation of electric refrigerators at (1) Florence Nightingale Hospital, Bury; and (2) Aitken Sanatorium, Holcombe. Specifications, etc., from Mr. F. Wild, clerk, 2, Cross Street, Bury.

LEYTON CORPORATION, August 31st–September 13th.—Electric light installation at Canterbury Road School. Specification, etc., from Mr. J. H. Jacques, 61, West Ham Lane, Stratford, London, E.15, until August 31st; deposit £1.

TIVERTON CORPORATION, August 31st.—One 150 kW semi-Diesel crude oil engine and generator. Tenders to the Town Clerk.

WARRINGTON WATER COMMITTEE, August 31st.—Supply of electrically-driven centrifugal pumping plant. Forms of tender, etc., from Mr. J. Gray, water engineer, Warrington; deposit £2 2s.

DEWSBURY AND WEST RIDING PERMANENT BUILDING SOCIETY, September 2nd.—Electricians' work in new premises in Church Street, Dewsbury. Specification, etc., from Messrs. Kirk, Sons and Ridgway, Market Place, Dewsbury.

STOKE-ON-TRENT CORPORATION, September 2nd.—Electric services to new ward and garage at Bucknall Infectious Diseases Hospital. Specification, etc., from the City Electrical Engineer; deposit £2.

WARRINGTON CORPORATION, September 2nd.—Twelve months' supply of (1) e.h.t. and l.t. paper and lead-covered cables; (2) earthenware conduits; (3) reinforced concrete cable protector slabs and tiles, and hard burned red tiles. Specifications (deposit £1 1s. for each) from Mr. F. V. L. Mathias, Electricity Works, Warrington.

BRADFORD EDUCATION COMMITTEE, September 3rd.—Electric lighting installation at Bolling Secondary School for Girls. Specification, etc., from the City Architect, Bradford.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, September 4th.—Extension of extra high pressure switchgear (contract No. 52). Specifications, etc., from Mr. R. W. Willis, 37, High Street, Cheadle, Cheshire; deposit £1 1s.

EPSOM GUARDIANS, September 4th.—Electric light installation at the institution. Particulars from the clerk, Mr. Alick G. Ebbutt, Mead House, 61, South Street, Epsom.

WOOLWICH ' GUARDIANS, September 4th.—Refrigerating plant. Further particulars from the Steward at the Hospital, Plumstead High Street, London, S.E.18.

STEPNEY (LONDON) GUARDIANS, September 5th.—Six months' supply of electrical fittings, etc. Forms of tender from Mr. S. McClelland, Administrative Offices, Bancroft Road, Mile End, E.1; stamped, addressed envelope to be sent.

HARROGATE CORPORATION, September 7th.—Supply and erection of overhead 11 000 V lines and 346/200 V lines. Specification, etc., from Mr. Neil McLean, borough electrical engineer, 33, Swan Road, Harrogate.

SCARBOROUGH CORPORATION, September 7th.—Supply and erection of e.h.t. and l.t. overhead lines (spec. 8/29); and supply of e.h.t. and l.t. paper insulated cable (spec. 9/29). Specifications, etc., from Mr. E. J. Jarvis, 89, Westborough, Scarborough.

CHARLTON KINGS CLUB, September 9th.—Electric light installation. Specification from the Steward; deposit £10.

LONDON COUNTY COUNCIL, September 9th.—Supply and erection of e.h.t. switchgear, etc., for tramway sub-stations. Specifications, etc., from the General Manager of Tramways, 23, Belvedere Road, S.E.1; deposit £2.

NEW MILLS URBAN DISTRICT COUNCIL, September 9th.—Electrical equipments, including e.h.t. and l.t. switchgear, transformers, transformer kiosk, e.h.t. and l.t. cables, feeder pillars, etc. Specification, etc., from the clerk, Mr. D. Bennett.

OLDHAM GUARDIANS, September 9th.—Electrical lamps and fittings. Particulars from the clerk, Mr. F. W. Fletcher.

WEST RIDING EDUCATION AUTHORITY, September 9th.—Electric lighting installation at the Sanatorium, Bingley Training College. Specification from the Education Officer, County Hall, Wakefield.

LIVERPOOL CORPORATION, September 10th.—Electric power and lighting installation for new abattoir, Stanley, Liverpool. Specification, etc., from Land Steward and Surveyor, Municipal Buildings, Liverpool; deposit £3 3s.

CENTRAL ELECTRICITY BOARD, September 11th.—Supply, delivery and erection of 132 kV overhead transmission lines (approach to Clarence Dock, Liverpool). Specification (No. N.W.E.-P.L.3) from Mr. R. H. Fox, secretary, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s. for first copy, and £1 1s. for each subsequent copy.

CROYDON GUARDIANS, September 11th.—Six months' supply of electrical fittings and appliances, etc. Forms of tender from the Clerk, Mayday Roa d,Thornton Heath; stamped, addressed envelope to be sent.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., September 12th.—Supply and erection of an electric passenger lift at Natural History Museum, South Kensington, London, S.W. Specifications, etc., from Contracts Branch, King Charles Street, London, S.W.1; deposit £1 1s.

REIGATE CORPORATION, September 12th.—Supply, laying, etc., of 1 800 yards of 0·2 sq. in. h.t., concentric, paper-insulated, lead-covered and armoured cable. Specification, etc., from Messrs. Handcock and Dykes, 11, Victoria Street, Westminster, S.W.1; deposit £2 2s.

HOLBORN (LONDON) GUARDIANS, September 18th.—Six months' supply of electrical fittings. Forms of tender from the Clerk, 53, Clerkenwell Road, E.C.1; stamped, addressed envelope to be sent.

STAFFORD COUNTY EDUCATION AUTHORITY, September 26th.—Electric light and power installation in new wing of Wolverhampton Grammar School. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £3 3s.

Installation Work in Schools.

EAST LOTHIAN EDUCATION AUTHORITY, September 27th.—Electrical work in connection with erection of public schools at Longniddry and Aberlady. Forms of tender, etc., from Messrs. Morham and Brotchie, 29, Hanover Street, Edinburgh.

METROPOLITAN ASYLUMS BOARD, October 2nd.—Installation of electric bells at Paddington Casual Ward (Contract No. 6); new storage battery for t.s. " Exmouth " (No. 7); and alterations to electric lighting in " X " block at Eastern Fever Hospital (No. 8). Specifications from the Board's Office, Victoria Embankment, E.C.4; deposit £1 for each.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—One 30 000 kW C.M.R. turbo-alternator and exciter, etc. Specifications from the Borough Electrical Engineer, 18-24, Lower Clapton Road, E.5; deposit £30.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—Three 125 000 lb. per hour normal (150 000 lb. per hour maximum) steam generating units, water tube boilers, with stokers, economisers, coal and ash handling equipment, etc., with foundations and boiler house buildings. Specification, etc., from the Borough Electrical Engineer, 18-24, Lower Clapton Road, London, E.5; deposit £3.

HACKNEY (LONDON) BOROUGH COUNCIL, October 9th.—Fourteen 6 600 V, three-phase, metal clad, oil circuit breaker equipments, each not less than 1 000 000 V rupturing capacity; remote electrically-controlled, duplicate busbars; cabling and auxiliary gear controlling one 30 000 kW turbo-alternator, two 30 000 kVA transformers, two 15 000 kW reactance links

Digitized by Google

one 30 000 kVA busbar coupler equipment, with and without reactance, and six 8 000 kW feeders. Specifications from the Borough Electrical Engineer, 18-24, Lower Clapton Road, E.5; deposit £3.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

CARLOW DISTRICT MENTAL HOSPITAL, August 30th.—Electric wiring in the principal mental hospital, Kelvingrove. Specification, etc., from Messrs. MacEntee and O'Kelly, 23, Upper O'Connell Street, Dublin; deposit £2 2s.

COMPAGNIE DES CHEMINS DE FER PORTUGAIS, August 31st.—Mechanical or electrical apparatus for operating points and signals. (Reference A.X. 8 367.)

WATERFORD HARBOUR COMMISSIONERS, August 31st.—Light standards, poles, cables, lamps, etc. Specification, etc., from the Harbour Engineer; deposit £2 2s.

PRETORIA CORPORATION, September 2nd.—Columns, fittings, lanterns, etc., for street lighting, and master clock for frequency regulation. (Reference A.X. 8 322.)

DUBLIN PORT AND DOCKS BOARD, September 3rd.—Supply and erection of two 4-ton level luffing electric portal cranes. Specifications from the engineer of the board, Mr. J. Mallagh, East Wall, Dublin.

OUDTSHOORN MUNICIPALITY, SOUTH AFRICA, September 3rd.—Supply and delivery of 35 kW steam-driven generating set, together with the supply and delivery only of certain switchgear material. (Reference B.X. 5 524.)

CAPE TOWN MUNICIPALITY, September 4th.—Steel poles, insulators, street lighting fittings, etc. (Reference A.X. 8 334).

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 7th.—Supply of v.i.r. wire. (No. P. and T. 151/1 573.) (Reference B.X. 5 416.)

A window display which Tungsram Electric Lamp Works (Great Britain), Ltd., have designed for the use of stockists.

LOUTH CORPORATION, September 9th.—(1) Mains and street work, and (2) sub-station equipment. Specifications from Messrs. Burstall and Monkhouse, 14, Old Queen Street, Westminster, S.W.1; deposit £3 for each contract.

MAFEKING MUNICIPALITY, September 9th.—Line material, poles, copper wire and cable, motors, fans, transformers, etc. (Reference B.X. 5 573.)

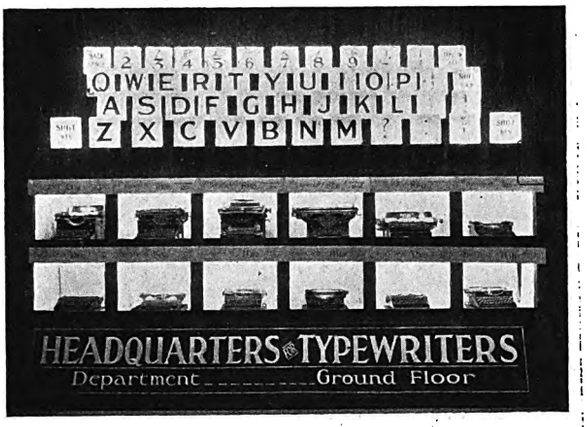
MAFEKING MUNICIPALITY, September 9th.—Steam raising plant, engines, alternators, switchgear, etc. (Contract "A.") (Reference A.X. 8 352.)

NEW ZEALAND POSTS AND TELEGRAPHS, September 10th.—Two-conductor cores (P. and T. 151/1 600). (Reference B.X. 5 462.)

LOURENÇO MARQUES PORT AND RAILWAYS, September 11th.—Battery tractors and trailers. (Reference A.X. 8 172.)

BULAWAYO MUNICIPALITY, September 13th.—Supply of h.t. overhead transmission lines, stepdown transformers, pumps with motors, etc. (Reference A.X. 8 181.)

AUCKLAND (N.Z.) ELECTRIC POWER BOARD, September 16th.—Supply of automatic sub-station at Remuera (two 500 kW machines and switchgear); automatci sub-station at Point Chevalier (two 1 000 kW machines and switchgear);



A well-lighted display of typewriters at Messrs. Selfridge's storesin Oxford Street, London.

22 000 V switchgear; 6 600 V switchgear; and supervisory control apparatus. (Reference B.X. 5 506.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, September 17th.—Supply and erection of petrol-electric sets. (Reference B.X. 5 537.)

SOUTH INDIAN RAILWAY CO., LTD., September 20th.—Supply of electric goods, locomotives and battery tenders, in connection with electrification of Madras suburban services. Specifications, etc. (£1) from the company's offices, 91, Petty France, Westminster, S.W.1.

SOUTH INDIAN RAILWAY CO., LTD., September 20th.—Electrical control and traction equipment for suburban services. Specifications, etc. (£1, not returnable), from the Company's Offices, 91, Petty France, Westminster, S.W.1.

EGYPTIAN MINISTRY OF THE INTERIOR, September 23rd.—Electric light installation and distribution system for the town of Kafr-el-Cheikh (Gharbieh Province). (Reference B.X. 5 502.)

INVERCARGILL (N.Z.) CORPORATION, September 23rd.—Supply and delivery of switchboard, to be directly operated and suitable for controlling 11 000 V, three-phase, 50-cycle current, it may be either of the draw-out truck type or totally armour clad, and will at first consist of seven units. (Reference B.X. 5 507.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 23rd.—Crude oil engine-driven 150 kW electric generating plant. (Tender No. 1 528.) (Reference B.X. 5 566.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, September 24th.—Supply of condensers (schedule C. 461.) (Reference B.X. 5 488.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 26th.—Two 100 kVA motor-alternators (tender No. 1 521). (Reference B.X. 5 564.)

DURBAN CORPORATION, September 27th.—Supply of three-phase ironclad, compound filled switch panels (specification S. 778). (Reference B.X. 5 505.)

Power Station Plant.

EGYPTIAN MINISTRY OF THE INTERIOR, September 28th.—Supply and erection of electric power station for the town of Samaunoud (Gharbieh Province). (Reference B.X. 5 596.)

EGYPTIAN MINISTRY OF THE INTERIOR, September 28th.—Machine tools, Diesel and semi-Diesel engines, boilers, electric batteries, etc., for the Prisons Administration. (Reference A.X. 8 245.)

MARLBOROUGH (N.Z.) ELECTRIC POWER BOARD, September 28th.—Supply and erection of 600 B.H.P. Diesel driven generating plant and switchgear. (Reference B.X. 5 556.)

COMPANHIA DOS CAMINHOS DE FERRO PORTUGUESES, September 30th (extension of time).—Signalling apparatus. (Reference A. 8 427.)

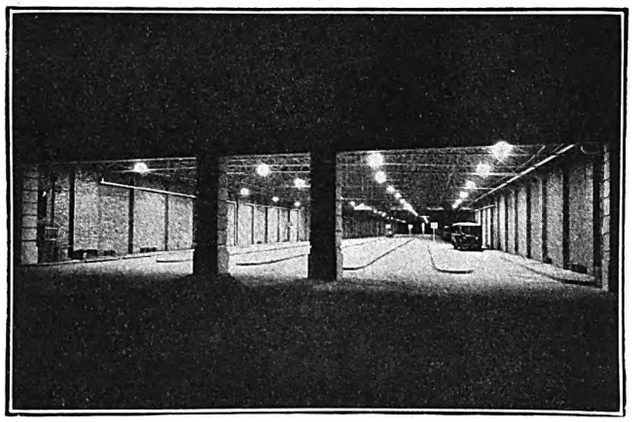
EGYPTIAN MINISTRY OF THE INTERIOR, September 30th.—Supply and erection of electric power station, with overhea

Digitized by Google

and underground networks, for the town of Deirout. (Reference B.X. 5 598.)

STATE ELECTRICITY COMMISSION, VICTORIA, September 30th.—Supply and delivery of three 3 000 kVA 50 cycle, oil immersed, self-cooled, outdoor type single-phase transformers and spare coils and bushings. (Reference B.X. 5 523.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, September 30th.—Twelve months' supply of electric lamps (tender No. 1 526). (Reference B.X. 5 590.)



THE spacious station which has been constructed at Kennington Oval (London) for Southern Coastal Services, Ltd., and will be available for the use of motor coach owners. It will accommodate more than 250 coaches. The lighting installation was carried out by Messrs. Pruden and Pope, and it comprises 54 Philips "N.R." type industrial reflectors with 300 W Argenta lamps. The whole station is flooded with an evenly diffused light, free from glare. The lights are more closely spaced over the loading platforms than the remainder of the garage, resulting in 8-10 ft.-candles over the platforms and 4-5 ft.-candles elsewhere.

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Three 3 000 kVA transformers and spares. (Reference B.X. 5 523.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply, erection and maintenance of coal conveying plant. Specification (No. 29/68) from the Agent-General, Victoria House, Strand, London, W.C.; deposit £2 2s.

WELLINGTON CORPORATION, September 30th.—Electric motors, starters and switchgear, for the Milk Department. (Reference B.X. 5 508.)

EGYPTIAN MINISTRY OF THE INTERIOR, October 1st.—Erection and equipment of electric power station (about 500 kVA), with overhead and underground networks, for the town of Menouf. (Reference B.X. 5 567.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, October 1st.—Supply of electric lamp standards. (Reference A.X. 8 251.)

POSTS AND TELEGRAPHS DEPARTMENT, MELBOURNE, October 1st.—Supply and delivery of switchboard cords. (Reference B.X. 5 515.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 1st.—Supply of bolts, brackets, screws, springs, etc., for British Post Office No. 121 wall telephones and No. 2 receiver switch. (Tender No. P. and T., 151/1 700).

EGYPTIAN MINISTRY OF THE INTERIOR, October 2nd.—Supply and erection of electric power station for Dessouk Town (Gharbieh Province). (Reference B.X. 5 597.)

Railway Signalling Equipment.

VICTORIAN RAILWAY COMMISSION, October 2nd.—Supply of a.c. line relays for power signalling. (Reference B.X. 5 563.)

MONTEVIDEO PORT ADMINISTRATION, October 7th.—Electric trucks, for load of 1 500 to 2 000 kilos, with generating sets for charging batteries, etc. (Reference A.X. 8 353.)

VICTORIAN ELECTRICITY COMMISSION, October 7th.—Supply and delivery of 11 000 V three-core cable. (Reference B.X. 5 539.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 15th.—Condensers (P. and T. 151/1 733). (Reference B.X. 5 602.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 15th.—Supply of B.P.O. type resistances. (No. P. and T., 151/1 712.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 15th.—Seven 5 500 kVA single-phase auto-transformers, with accessories, for Waitaki power scheme. (Reference B.X. 5 417.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 15th.—Switchboard instruments, test plugs and sleeves (schedule C. 472). (Reference B.X. 5 541.)

WELLINGTON POSTS AND TELEGRAPHS DEPARTMENT, October 15th.—Supply and delivery of B.P.O. type resistances. (Reference B.X. 5 551.)

WELLINGTON POSTS AND TELEGRAPHS DEPARTMENT, October 15th.—Supply and delivery of B.P.O. type retardation coils. (Reference B.X. 5 552.)

EGYPTIAN MINISTRY OF THR INTERIOR, October 16th.—Electric motors, pumps, filters, and artesian well. (Reference A.X. 8 373.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 16th.—Automatic wall and table telephones. (Reference B.X. 5 509.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 16th.—Automatic telephone dials (P. and T. 151/1 734). (Reference B.X. 5 605.)

SALISBURY (S. RHODESIA) MUNICIPALITY, October 17th.—Turbo-alternators, steam piping, crane and switchgear (contract 52). (Reference B.X. 5 607.)

SALISBURY (S. RHODESIA) MUNICIPALITY, October 17th.—Supply of h.t. cables, transformers and sundries, in connection with extensions of the electricity undertaking (contract 53). (Reference B.X. 5 604.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Supply of insulated wire (schedule C. 475). (Reference B.X. 5 580.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, October 22nd.—Telephone transformers (schedule C. 474). (Reference B.X. 5 581.)

MELBOURNE CITY COUNCIL, October 30th.—Two 2 500 kW motor-convertors and accessories, or two 2 500 kW rotary convertors, with transformers and accessories. (Reference B.X. 5 570.)

NEW ZEALAND POSTS AND TELEGRAPHS, October 30th.—Head receivers (P. and T. 151/1 725). (Reference B.X. 5 603.)

WESTERN AUSTRALIA GOVERNMENT, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General, Savoy House, Strand, London, W.C.2.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, December 10th.—Three single phase, oil insulated, water-cooled transformers, with accessories (section 295). (Reference B.X. 5 600.)

Tenders Accepted.

OLDHAM CORPORATION.—Union Cable Co., Ltd., supply of cable.

HULL CORPORATION.—General Electric Co., Ltd., twelve months' requirements of Osram gasfilled and vacuum and Robertson carbon filament lamps.

ROYAL MAIL STEAM PACKET CO.—Siemens Electric Lamps and Supplies, Ltd., supply of metal filament and carbon filament lamps during twelve months. (Repeat contract.)

NEW ZEALAND GOVERNMENT.—British General Electric Co., Ltd. (Wellington), supply of electric lamps, for a further twelve months. The contract for 1928 called for nearly 70 000 Osram lamps.

EASTBOURNE CORPORATION.—General Electric Co., Ltd., supply of switchgear and transformers required to control supply proposed to be taken from Central Electricity Board, £28 678. (Recommended.)

MANCHESTER SOUTH JUNCTION AND ALTRINCHAM RAILWAY.—Callender's Cable and Construction Co., Ltd., overhead equipment; British Thomson-Houston Co., Ltd., electrical plant for two sub-stations; General Electric Co., Ltd., electrical equipment of trains.

LONDON COUNTY COUNCIL.—Stegman and Co., wiring and fittings for electrical lighting at Baring Road School, Lewisham. £215. Also tendered: Coleby and Co., £223; H. J. Cash and Co., Ltd., £253; Electrical Installations, Ltd., £275; Smethurst and Co. (London), Ltd., £285.

LEEDS CORPORATION.—A. Reyrolle and Co., Ltd., supply of sub-station switchgear, £1 060. W. T. Henley's Telegraph Works Co., Ltd., cables, £3 900; Enfield Cable Works, Ltd., cables, £4 182; Macintosh Cable Co., Ltd., cables, £4 331; and Hackbridge Cable Co., Ltd., cables, £163.

CHELTENHAM CORPORATION.—Supplies for 12 months:—The Hackbridge Cable Co., Ltd., cables at schedule prices; meters: the Electrical Apparatus Co., the Edison Swan Electric Co., Ltd., and Metropolitan-Vickers Electrical Co., Ltd.; transformers—the English Electric Co., Ltd.

Digitized by Google

HIGHLY PARISH COUNCIL.—Shropshire, Worcestershire, and Staffordshire Electric Power Co., erection of 33 brackets for electric light and supply of current for lighting 33 100 W lamps from one hour after sunset until 10.30 p.m. during season between September 1st and April 30th, £2 12s. 6d. per point for the season.

NOTTINGHAM CORPORATION.—English Electric Co., Ltd., six double-deck, top-covered, six-wheel electric trolley buses, each with seating capacity for sixty passengers. The equipment will consist of an 80 H.P. motor and standard foot-operated camshaft controller. The complete vehicles will be built at the company's Preston works.

CENTRAL ELECTRICITY BOARD.—English Electric Co., two 15 000 kVA, 132 000 V 3-phase transformers for Central Scotland Scheme, for installation at Saltcoats. The two units will each be provided with on-load tap changing equipment, and will be similar to the four 15 000 kVA and four 10 000 kVA 3-phase units already supplied and on order.

AUCKLAND TRANSPORT BOARD.—General Electric Co., Ltd., 104 tramway motors, each rated at 40 B.H.P. 500 V, on one-hour rating. The motors will be of the G.E.C. standard self-ventilated interpole type (Oerlikon system) and will be fitted with roller type armature bearings. The order also includes the supply of resistances, lighting arrestors, etc.

HULL CORPORATION.—Annual supplies to Electricity Department: Lamps and fittings, General Electric Co., Ltd; fuse boxes, Sykes and Dyson, J. H. Tucker and Co., Ltd., Crabtree and Co., Siemens Bros. and Co., Ltd., and W. Lucy and Co., Ltd.; meter boards, T. Beadle and Co., Ltd.; fuse wire and strip, Enfield Cable Works, Ltd.; lead wire, Siemens Bros. and Co., Ltd.; conduit tubing, Simplex Conduits, Ltd.; conduit fittings, B. Danby and Co., Ltd.; v.i.r. and c.t.s. cables, Edison Swan Electric Co., Ltd.

GLASGOW CORPORATION.—Johnston, Park and Co., Ltd., electrical installation at Partick Burgh Hall, £500 15s. 10d.—D. Henderson, electrical installations at 90 houses on Allan Street area, £382 5s., and Braidfauld Street area, £361 16s. 9d.; Edgar Allen and Co., Ltd., and Titan Trackwork Co., Ltd., special tramway track work; British Insulated Cables, Ltd., copper bonds; Joseph Cookson, Ltd., trolley cord; Manchester Armature Repair Co., Ltd., armature coils; Bolckow, Vaughan and Co., Ltd., fishplates.

COLCHESTER CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., 200 kVA transformer for installation at Hythe generating station, £128; Electric Construction Co., Ltd., two 1 500 kVA step-up transformers and switchgear for installation at Hythe generating station (conditional upon transformers being Metropolitan-Vickers), £3 200, and two additional e.h.t. switch cubicles in sub-station at Water Tower, Wivenhoe, £290; Ferguson, Pailin, Ltd., transformer kiosks at Wivenhoe, West Bergholt and Stanway, £1 277. (All recommended).

MANCHESTER CORPORATION.—Hall and Stinson, electrical installation in houses on Moston estate; Brown and Co. (Electrical Engineers), Ltd., electrical installation in cottages at Thirlmere waterworks; Titan Trackwork Co., Ltd., special tramway track work (portion); Edgar Allen and Co., Ltd., special track work (portion); Hurst Nelson and Co., Ltd., steel underframes for tramcar bodies; Brush Electrical Engineering Co., Ltd., tramcar trucks and brakes. Static transformers: Fuller Electrical and Manufacturing Co., Ltd., C. A. Parsons and Co., Ltd., and Metropolitan-Vickers Electrical Co., Ltd.

MANCHESTER CORPORATION.—Twelve months' supplies to Electricity Committee: Cable, Connollys (Blackley) Ltd., Johnson and Phillips, Ltd., Pirelli-General Cable Works, Ltd., Macintosh Cable Co., Ltd., Standard Telephones and Cables, Ltd.; and W. T. Glover and Co., Ltd.; dry batteries etc., for flash lamps, General Electric Co., Ltd.; insulators, Doulton and Co., Ltd., Gaskell and Grocott, Wm. Kent, J. Macintyre and Co., Ltd., Metro-Vick Supplies, Ltd., and Taylor, Tunnicliffe and Co., Ltd; service boxes, etc.. Forrest and Sym, W. Lucy and Co., Ltd., Meldrums, Ltd., J. Needham and Sons, Ltd., Siemens Bros. and Co., Ltd., and Sykes and Dyson, Ltd.; street lanterns General Electric Co., Ltd., and Wardle Engineering Co., Ltd.; transformers, (autos and balancers (auto), British Electric Transformer Co., Ltd., and General Electric Co., Ltd; trifurcating boxes, British Insulated Cables, Ltd., Forrest and Sym, and Sykes and Dyson, Ltd.; wires (cotton and silk covered), London Electric Wire Co., and Smiths, Ltd.; conduit and accessories for wiring, Simplex Conduits, Ltd.

BUSINESS ITEMS.

FROM September 1st the telephone number of the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, will be Temple Bar 8000 (70 lines); special number for trunk calls up to 6 p.m., Temple Bar 2051.

SUPER-ELECTRIC HEATERS (1929), LTD., have removed to larger and more convenient premises, and their new address is Albion Works, West Bromwich.

A well-known Canadian firm proposes to erect a modern 15-storey office building in Winnipeg at an estimated cost of $2 000 000, and the architect responsible for the plans of the building desires to receive catalogues and quotations from United Kingdom manufacturers of furnishings and such other requirements as cannot be obtained from Canadian sources. Further particulars from the Department of Overseas Trade. (Reference C.X. 3109.)

Mr. Thomas Wood, Midland Counties' representative of A. H. Hunt, Ltd.

Messrs. A. H. Hunt, Ltd., of H.A.H. Works, Tunstall Road, Croydon, announce the following changes in their outdoor sales staff for the London area:—Mr. F. S. Richmond, who has previously worked the eastern half of London, i.e., within 11 miles of Charing Cross and east of a north and south line through Kingsway, has now taken over the whole of the London district, concentrating solely upon manufacturers of electrical, motor and wireless accessories, and Mr. A. Hudson, of 37, St. Mary's Road, Leyton, E., has been appointed on Mr. Richmond's old ground to take care of the wholesale and trade customers. Mr. Hudson has been intimately connected with the electrical and wireless trade for a number of years in the capacities of salesman and buyer to several large London wholesalers. Mr. E. West continues with the western half of London, excepting manufacturers, where he has represented the company for the last seven or eight years. A change has also been made in the Midlands district, which is now journeyed by Mr. Thomas Wood, of 22, St. Lawrence Avenue, Warwick. Mr. Wood is, well known amongst electrical and wireless wholesalers and manufacturers in the Midlands.

Mr. A. Hudson, representative of A. H. Hunt, Ltd., for the Eastern half of London.

MESSRS. LEONARD TOOMER AND CO., wholesale electrical and radio suppliers, 54, Lower Thames Street, London, E.C.3, will be glad to receive new season's catalogues of electric lamps, lighting supplies and wireless sets and components, together with factors' quotations.

The Leicester branch of T. BEADLE AND CO., LTD., wholesale factors of electrical and wireless supplies, of 3, 4 and 5, Castle Street, Hull, has been removed from 26, Charles Street, Leicester, to 27, Fox Lane, Leicester, and a new branch is being opened at 34, Heathcote Street, Nottingham, on September 1st.

Messrs. Bruce, Peebles and Co., Ltd., have appointed Mr. G. E. Whitehead, 102, St. Mary Street, Cardiff, as their representative in South Wales and Gloucestershire, Somerset, Devon, and Cornwall.

The current stock list of the A.C.E.C. has been received.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, have sent us a copy of leaflet No. 407F, dealing with a new range of ceiling units.

SIEMENS BROTHERS AND CO., LTD., Woolwich, London, S.E., have sent us Catalogue No. 160, Section VI, dealing with straight joint boxes.

Pamphlet No. P.1332 concerning "wave" tumbler switches has been issued by FALK STADELMANN AND CO., LTD., 83-93, Farringdon Road, London, E.C.1.

ELECTRICITY SUPPLY.

Conversion of Bridlington Supply—Two-Part Tariff for Bournemouth—Loan for Louth Scheme—Loss of Employment Caused by Irish National Scheme—Inauguration of Antrim Company's Supply.

BARNSLEY Electricity Committee has decided to extend mains to the Willow Bank district.

Cannock U.D.C. has decided to lay a new main to Rawnsley and Cannock Wood at an estimated cost of £2 663.

The Yorkshire Electric Power Co. has applied to Welton R.D.C. for its consent to supply electricity in several parishes in the district.

Driffield R.D.C. has decided to withdraw opposition to the electricity scheme for the Buckrose area promoted by the Holderness Trust, Ltd.

An application has been made by Bridlington T.C. for a loan of £41 890 to defray the cost of converting the distribution system from d.c. to a.c.

The Bournemouth and Poole Electricity Supply Co. has informed Bournemouth Corporation that it is proposed to introduce a two-part tariff system.

Barnsley Electricity Committee recommends that £5 000 be transferred to reserve fund and £6 718 to renewals fund out of the surplus on the past year's working of the electricity undertaking.

The applications of Ipswich and Norwich Corporations for powers to supply electricity in the Brandon rural area have not been granted, and the supply will be in the hands of the East Anglian Co.

Louth T.C. has decided to apply to the Electricity Commissioners for sanction to borrow £27 000 for the electricity scheme, under which it is proposed to purchase current in bulk from Grimsby Corporation. It is expected that the scheme will be in operation by the end of the present year.

Dunfermline Dean of Guild Court has passed the plans of the Central Electricity Board for extensions at the Fife Electric Power Co.'s station at Townhill. The extensions are to consist of the erection of a battery house and control room, oil plant house, insulator table, and eight lattice towers. The cost of the work amounts to £3 500.

Stockport T.C. has applied for loans of £100 000 for mains extensions and services, £7 001 17s. 9d. for meters, £10 000 for sub-stations on consumers' premises, £36 000 for changing over in Davenport and Heaton Norris districts, and £10 000 for changing apparatus on consumers' premises. A loan is also to be sought for replacing No. 4 turbine.

Wexford Corporation has approved of a recommendation of the Lighting Committee to accept the quotation of the Electricity Supply Board to light the town till March 31st, 1930, for £450. The Mayor recently stated that, under the agreement, 45 extra lamps would be lighted, and the cost of lighting the town would be 6d. in the £ instead of 10d. as at present.

Mr. E. Cross, borough electrical engineer of Rotherham, has submitted a report to the Electricity Committee on the operation of the rateable value system of charging under existing conditions of assessments. Consideration of the matter has been deferred, and the Engineer has been instructed to obtain information with regard to this system of charging in other towns.

Battersea (London) Borough Council has applied to London County Council for consent to the installation of an a.c. distribution system at 50 cycles and 230 V single-phase and 400 V three-phase in that part of the borough in which a d.c. supply is at present in force, and in substitution for such d.c. supply. Any representations by consumers or other interested parties are to be sent to the County Council before September 9th.

Col. T. C. Ekin held an inquiry on behalf of the Electricity Commissioners on August 15th into the application of Retford T.C. for a loan of £16 250 for electricity purposes. There was no opposition. The inspector said that he understood that the Council had modified its application, and that the actual sum applied for was £6 314. It was explained that the Council desired to limit the inquiry to the route which took in various places as far as Tuxford.

Reigate T.C. has applied for a loan of £5 200 for laying a new h.t. feeder from the works to Redhill. The Council is making inquiries of the Commissioners concerning a bulk supply of electricity as from the autumn of 1930. The Electricity Committee is to lay mains and wire houses on the Redstone site, under a hire-purchase scheme, at a cost to the Housing Committee of £2 per house.

The deferred payment scheme for covering the cost of installations at Oldham has been successfully inaugurated by the Electricity Committee, which during the past year dealt with 1 156 applications. The Committee has introduced a rateable value system of charging. The Corporation's Slacks Valley station, scheduled as a "selected" station, is nearly completed. A net profit of £26 617 on the electricity undertaking is recorded for the past year.

In order to supply the parish of Telscombe, a small electrically-driven boosting plant is to be installed by Brighton Waterworks Committee, at a cost of £805. The Electricity Committee has obtained sanction for the following loans: £4 235 for the reconstruction of the boiler house roof at Southwick power station; £30 000 for alterations and additions to the North Road sub-station; £5 360 for ash disposal plant at Southwick power station; £5 500 for telpher equipment at Southwick; £45 000 for additional boiler plant at Southwick, and £18 000 for work in connection with the new switchroom at North Road.

From the experience of a deputation which waited on the Electricity Supply Board in Dublin recently, it is surmised that the Limerick power station will be closed down in September. The deputation asked for compensation for eight members of the Limerick staff who will be thrown out of work by the Shannon scheme. They were informed that consideration could not be given to compensation claims or alternative work provided, and that would not only apply to Limerick but to every station taken over by the Board.

Mr. C. Norman Staniland, borough electrical engineer, Hornsey, has reported to the Electricity Committee that he has been going into the question of gear made by Mr. Bertram Thomas, installed at the Southfield Road sub-station of the Metropolitan Electric Supply Co., Ltd., and designed to assist in avoiding any delay in getting away after a breakdown. He has obtained prices, and estimates that similar gear for Hornsey would cost, installed, from £700 to £800. The Committee recommends such gear be obtained.

Messrs. Twyfords, Ltd., have been in negotiation with Stoke-on-Trent electricity department for a supply of about 50 H.P. at their new works proposed to be erected in Garner Street, Cliffe Vale. The committee has agreed to consider the question of the provision of the mains and sub-station equipment, subject to the company's providing or selling a site for a sub-station and guaranteeing to pay for energy to the value of at least £500 per annum. Cables are to be laid from the central power house to the Newcastle boundary, in connection with the supply to the Hill Farm Estate.

The first sod of the new Antrim Electricity Supply Co.'s scheme was formally cut at Curran Point, Larne, on August 22nd. The transmission line will be 27 miles long, though an extension to 50 miles is to be provided for. The line will be laid in the water at Curran Point and carried below the waters of the Lough—Larne Lough and thence over the mainland by lattice towers to Ballymena, *via* Ballyclare and Doagh, with subsidiary lines, eventually, to other towns. Ultimately, the Antrim Co. will link up with Belfast Corporation's system. The construction work is being carried out by Messrs. Henry Boot and Sons, Ltd. (Mr. R. B. Waite acting as their engineer-in-chief) and W. T. Henley's Telegraph Works Co. Henley's contract comprises 14 miles of six-wire and 12¾ miles of three wire aluminium conductor steel reinforced transmission line on lattice steel towers.

Marylebone (London) reports that it recently made representations to the London County Council urging that consent should be given to the B.C.'s proposal that the pressure of alternating supplies throughout the borough should be at 240 and 415 V. Representatives of the County Council expressed the opinion that the standard pressures, 230 and 400 V, should be adopted, with a view of establishing a uniform pressure for the whole of London. The Committee pointed out, that this would involve expenditure of at least £100 000 for the changing of lamps alone, and, subsequently, an application was made to the County Council for a temporary general consent to an alteration to 240 and 415 V, three-phase. The County Council, however, decided generally that it could not consent to any changes from d.c. to a.c. other than changes involving the adoption of pressures of 230 and 400 V.

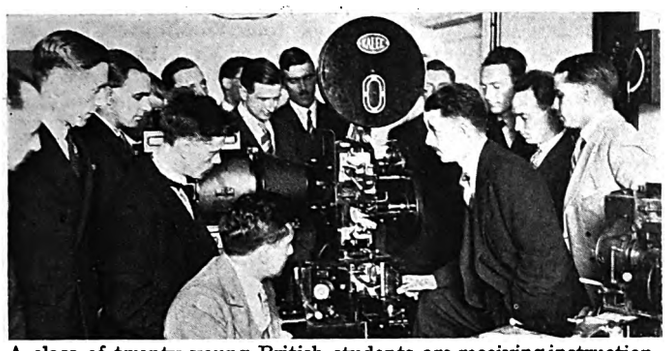
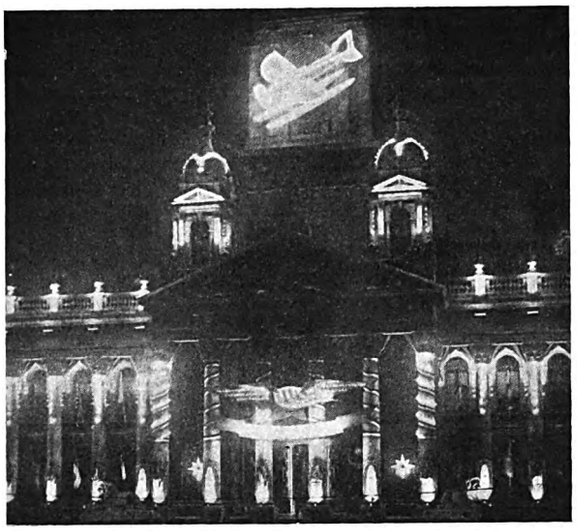
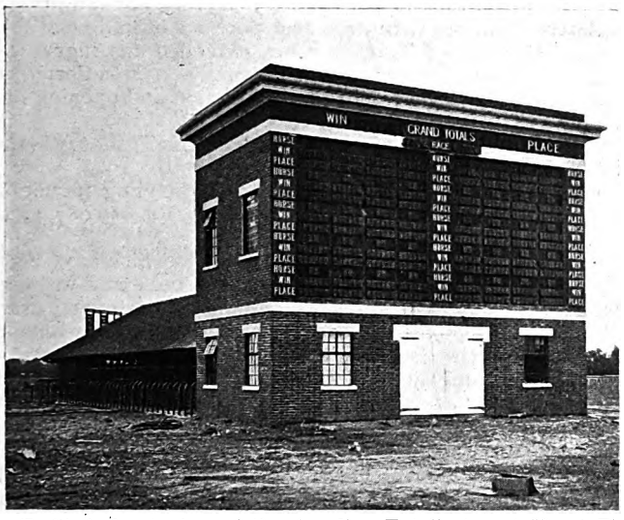
ELECTRICAL NEWS PICTURES

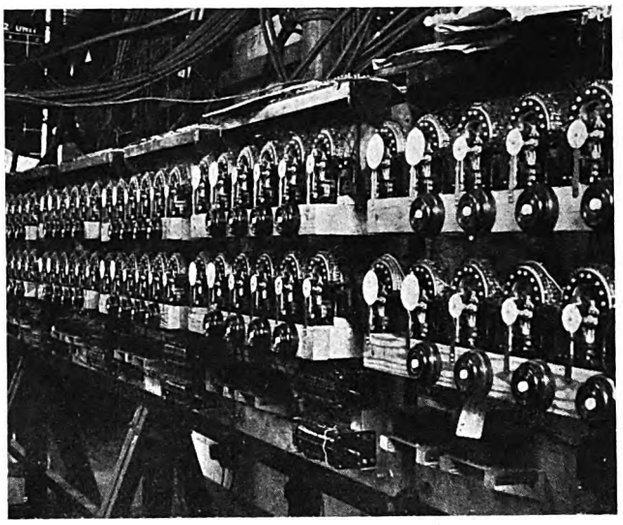


A class of twenty young British students are receiving instruction, relating to the construction and use of " talkie " apparatus, at Bush House, London. The tuition to an ever changing class will go on for some months. The operation of the Western Electric reproducer set is being explained by an English teacher.

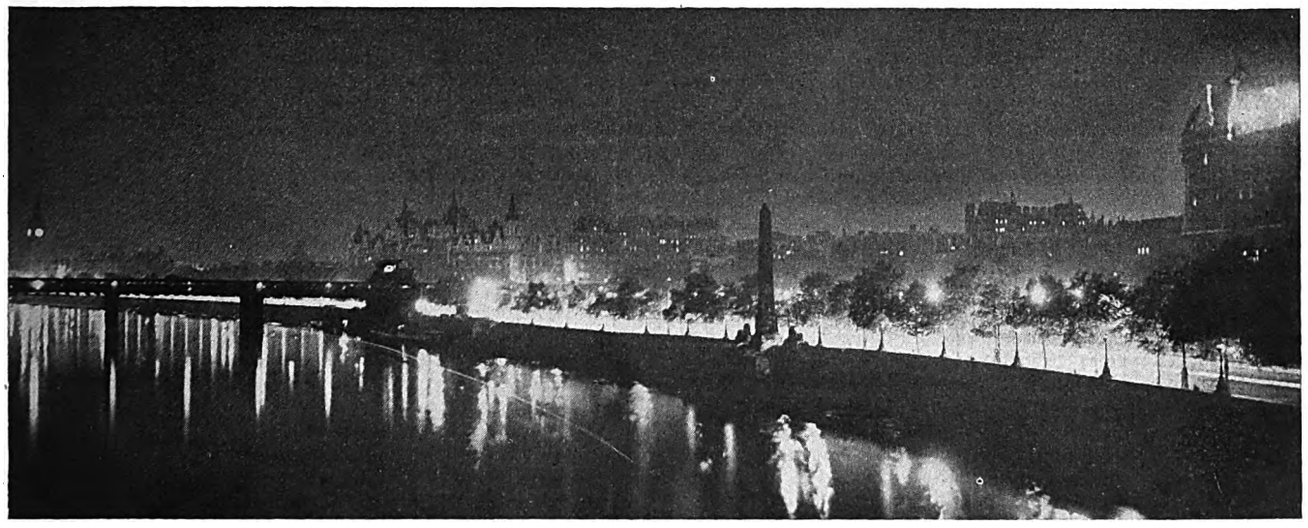


Portsmouth City Hall, illuminated for the Schneider Cup race, showing an aeroplane outlined in light.





(Left) A front view of the Amplion Totalisator at Hurst Park, showing indicator, and (right) an interior view of the same apparatus, showing the temporary controls. This, the first fully mechanised Hamilton Totalisator constructed by Graham Amplion, Ltd., and erected at Hurst Park, did good business at the race meeting there last Friday and Saturday, but, unfortunately, it was impossible to complete the installation so that the electric indicator could be used, this being due to the short time available for the work. A completed totalisator will, however, be supplied for a meeting in the near future.



The Victoria Embankment, London, from Waterloo Bridge, to Westminster, showing the brilliant new central lighting as seen from Waterloo Bridge. The original standards along the parapets have been retained. The twin overhead suspended lighting along the roadway is done by means of units consisting of two General Electric 1 500 W lamps, housed in " Wembley " lanterns suspended 30 ft. over the roadway. The scheme comprises 50 spans, spaced at intervals of 140 ft., each span carrying two lamps.

REDUCTIONS OF CHARGES.

THE following reduced charges for electricity are announced. Figures in parentheses represent the former rates :—

Bury St. Edmunds, private lighting, 6d. (6½d.), less ½d. per kWh discount; power, up to 2 500 kWh per quarter, 3½d., less 20% (5½d. per kWh up to 500 kWh per quarter); maximum demand, business premises, £15 per annum per kW, plus 1½d. per kWh; West Suffolk Hospital, 3d. for all purposes. *Canterbury*, large power consumers of a.c., e.h.p current, who have 200 H.P. connected, and take minimum of 50 000 kWh per quarter, £4 per kVA maximum demand, plus 0·5d. kWh, electricity for lighting not to be more than 10% of total used. *Winchester*, flat rate, 6½d. (7d.) per unit; prepayment meters, 7d. (7½d.); maximum demand tariff, private houses, discontinued; business premises, lighting, 9d., 4d. and 2d. (9d., 5d. and 2d.); rateable value tariff discontinued; two-part tariff adopted; living rooms to be assessed at fixed charge of 3s. per room per quarter for the two summer quarters, and 6s. per room per quarter for two winter quarters, plus flat rate 1½d. *Doncaster*, fixed annual charge for domestic supplies, 10% (12½%) on the rateable value, with minimum charge, 35s. per annum, plus ¾d. kWh; Tramways dept. to be allowed discount of 10% on present charge of 1d. per kWh. *Watford*, optional rateable value tariff, Borough, Watford Rural, Bushey and Abbots Langley, 12½% and ½d.; Aldenham, 13¾% and 0·55d.; Hemel Hempstead, King's Langley and Bovingdon, 15% and 0·55d. *Stamford* (*Urban Electric Supply Co.*), lighting, 9d.; power, 3d.; household heating, 2d., provided T.C. grants company monopoly for 40 years. *Bromley*, power, 2d. (2½d.) per kWh for first 3 000 kWh per quarter; next 3 000, 1½d. (2d.); beyond, 1d. (1½d.); heating and cooking, 1¼d. (2d., or if cooker installed 1½d.) service cables to be laid free, up to 30 feet. *Brightlingsea* (*Frinton-on-Sea and District Electric Light and Power Co.*), lighting, 9d.; cooking, heating and power, 2d.; alternative tariff for domestic purposes (lighting, heating, cooking, etc.), 20% on rateable value, plus 1½d. per kWh; minimum quarterly payment, £1; water heating, ½d.; fixed bedroom heaters, ¾d. *Epsom*, alternative all-in two-part tariff to cooker consumers, with fixed annual charge, plus ¾d. per kWh. The charge is £2 16s. 8d. when floor area is up to 1 200 sq. ft. to £45 6s. 8d. when area is up to 16 000 sq. ft.; larger premises *pro rata*; business premises included if cooker is installed. *Millom*, lighting, 6d. (7d.); heating and cooking, 1¾d. (2½d.). *Grantham* (*Urban Electric Supply Co.*), lighting, 8d. (8½d.), kWh allowed to weekly payers increased by approximately 15 to 20%, excess consumption, 5d. per kWh. *Bentham* (*Bentham Electric Supply Co.*), lighting, 1s.; other purposes, 6d. *Grimsby*, ordinary lighting, 6½d.; slot meters, 8d. *Tunbridge Wells*, lighting in Borough and at Southborough, 4d. (4½d.); in other areas, 4½d. (5d.) per kWh; domestic rate 10% of rateable value (12½%) in Tunbridge Wells and Southborough, and 12½% (15%) in other areas; power, 1d. per kWh for first 30 000 p.a. and ¾d. beyond. *Darwen*, domestic rates for summer quarter, 5d. (5½d.) per kWh for less than 30 kWh, and 4¾d. (5d.) over; heavy industrial consumers, over 100 kWh up to 500 per quarter, 2d. (2½d.), second 500 kWh 1 $\frac{5}{16}$d. (1$\frac{5}{8}$d.); second, 1 000 1 $\frac{3}{16}$d. (1¼d.); over 4 000, 1 $\frac{1}{16}$d. ($\frac{7}{8}$d.); domestic power, heating and cooking, reduction of ½d. per kWh over 30 kWh; contracts subject to 27½% discount (22½%), and for late shop window lighting 2¾d., conditional on paying 10s. per quarter for meter rent and time switch. *Connah's Quay*, reduction of 12½% on slot as well as quarterly meters. *Carnarvon* (*National Electric Construction Co.*), lighting, 6d. (7d.). *Wallasey*, kilowatt charge for supply to Birkenhead in bulk, 17s. (18s. 9d.) per quarter. *Oldham*, cotton mill power supplies, first 10 000 kWh per calendar month, 0·7d. per kWh; next 10 000, 0·5d.; next 20 000, 0·45d.; all additional, 0·425d. per kWh.; tariff is based on average price paid for coal and cost of disposal of ashes, amounting together to 15s. per ton; kWh prices to be increased 0·003d. for each 3d. variation per ton. Where a mill is wholly electrically driven, and has constant demand of 500 kW or over, allowance for lighting premises is made of 5% of annual power consumption at 0·7d. per kWh, plus coal variation clause; in other cases lighting charged in accordance with ordinary lighting rates. *Torquay*, fixed rate per week per house, in respect of supply to Corporation houses to 1s. 1d. (1s. 3d.); kWh rates, ¾d. ($\frac{7}{8}$d. and 1d.); standing charges as before; discount for prompt payment to be reduced from 5% to 2½; special sliding scale power rate revised so that lowest price is ¾d. (1d.) *Carlisle*, late shop window lighting, 32s. per annum for time switch and meter, plus 2d. per kWh.

ELECTRIC TRACTION.

Electrical Equipment of Manchester South Junction and Altrincham Railway.

AN interesting feature in connection with the electrification of the Manchester South Junction and Altrincham Railway, contracts for which have recently been awarded by the G.C. and L. & N.W. Railways Joint Committee, is that the overhead contact wire system at 1 500 V d.c. has been adopted. This is the first railway electrification to be carried out in Great Britain at this voltage, which is the higher of the two standard voltages recommended for railway electrification in this country. The British Thomson-Houston Co., Ltd., Rugby, has been entrusted with the order for the complete sub-station plant, comprising switchgear, transformers, rotary convertors and control equipment, the latter being of the automatic type with remote control for one of the two sub-stations. In each sub-station there will be six 750 kW 750 r.p.m. rotary convertors, with transformers to take the incoming supply at 11 000 V, three-phase, 50 cycles from the Stretford District Electricity Board, the rotary convertors being operated two in series.

The traffic receipts on the Belfast tramways on the day of the great motor car race and during the previous night amounted to £2 710, an increase of £584 over the race day takings last year.

The Associated Gas and Electric System has entered into a long-term contract to supply the Delaware Lackawanna and Western Railroad with power for portions of its lines.

The Minister of Transport has extended to August 15th, 1929, the period limited by the Thornaby-on-Tees Corporation Tramways Order, 1919, for the completion and opening of the tramway authorised by such Order.

The traffic receipts of the Madras Electric Tramways (1904), Ltd., for the fortnight ended August 15th, 1929, were Rs. 46 482, against Rs. 47 822 in the corresponding fortnight of 1928. Aggregate from January 1st, 1929, Rs. 659 087, against Rs. 637 795.

The late night services for excursionists which have been in operation for about four years on the Leeds tramways have led to a great increase in the total number of passengers carried. A recent development is an arrangement under which passengers book their seats on the late trams when they take railway tickets, and the tramway accommodation is guaranteed.

A device for encouraging traffic on the public road vehicles in London, and also increasing business on trunk railways is a scheme to be put into operation by the Great Western Railway next month, under which the company will issue all day tickets at two shillings each, for which a half day or whole day excursion from the country to town and a very considerable bus, tube and train service in London may be enjoyed.

Mr. W. Sharp lectured on "Modern Power Plant" at Armstrong College, Newcastle-on-Tyne, on August 18th, his address being the first of a series arranged by the Association of Engineering and Shipbuilding Draughtsmen. Mr. Sharp said, in accordance with the Electricity Act of 1926, we were to have concentration of electricity generation in a few selected stations. He ventured to state that immediately the grids were erected and in working order no time would be lost in the electrifying of the whole of the existing railway system throughout the country.

THE ARAPUNI (N.Z.) POWER SCHEME.

A "Daily Telegraph" correspondent reports that statements in the New Zealand Parliament and the Press indicate that the Government's £2 000 000 hydro-electric power scheme at Arapuni may become a gigantic fiasco. The original contractors refused to complete the contract, the Public Works Department finished the work, and the first set started working in June last, two years behind schedule time. When the big dam was completed and the Waikato River diverted, erosion below the spillway caused trouble and silted up the Horahora power-house down-stream. Now the river is breaking up the rocks and causing serious danger at the waterfall near the spillway. Extensive falls of rock recently caused a sudden retrogression of 200 ft. of the waterfall. The river is in flood, and should it be allowed to continue over the spillway there would be danger of the works being undermined. The only safe course is to open the diversion tunnel under the dam, drain the lake, and close the works for at least a year while the waterfall is strengthened.

COMPANY NEWS.

Decline of G.E.C. Shares—Rise in Ever Ready's—Tyneside Tramways Show Further Loss—Rapid Rise of Domestic Demand at Stratford-on-Avon—Meeting of Electro-Trust, Ltd.—New Companies Registered.

GENERAL Electric shares are a further half-crown down on the week, at 57s. 6d.; and Henley's at 125s. show a similar decline. Ever Ready's have been in request, and the price has risen from 21s. 9d. to 22s. 9d. Cables and Wireless issues continue an active market, but selling has predominated, and both the "A" and "B" stocks have given way slightly, the "A" 2½ points, and the "B" 3½ points. Marconi's International Marine shares are 2s. 6d. lower at 58s. 9d. Underground Railways ordinary shares have spurted 1s. 6d. to 24s., and Metropolitan ordinary stock is up to 60. Charing Cross and County Supply ordinary shares have both weakened 6d.

PINCHIN, JOHNSON, LTD.—Intm. div. of 10% (same rate as last year) has been declared.

NORTHAMPTON ELECTRIC LIGHT AND POWER CO., LTD.—Intm. divs. of 2½% on 5% pref. shs. and 4% on ord. shs. have been declared.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO., LTD.—Intm. div. of 2½% (same rate as last year) on ord. shs. will be payable on Sept. 30.

BABCOCK AND WILCOX, LTD.—It is reported that the co. has purchased 49% of the shs. in the Zieleniewski Fitzner Gamper Co., the largest Polish boiler works.

FARNHAM GAS AND ELECTRICITY CO.—Intm. div. at rate of 7½% p.a., less tax (same rate as last year), on ord. shs. (7% standard) for half-year will be payable on Sept. 6.

ALLGEMEINE ELEKTRICITATS GESELLSCHAFT (BERLIN).—The allotment of new shs. of nom. value of £1 500 000, at rate of 200%, to the General Electric Co. of New York has been approved.

CUBA SUBMARINE TELEGRAPH CO., LTD.—Receipts for 1928, £57 593, agst. £56 720; exes. £27 191, agst. £33 159, blce. £30 402, plus £10 170 brt. in. Pref. div. required £6 000; to gen. res., £20 000; fwd., £12 794.

BOGNOR GAS AND ELECTRICITY CO., LTD.—Intm. div. at rate of 8% p.a. on original and additional ord. con. stks. "A," 9½% p.a on original ord. con. stk. "B" and 7% p.a. on new con. stk., will be payable, less tax, on Sept. 2.

BRAZILIAN TRACTION, LIGHT AND POWER CO.—The Canadian Press has published a denial of the rumours circulated that negotiations were pending for the acquisition of the control by an American concern of the shares of the Brazilian Traction, Light and Power Co.

CLYDE VALLEY ELECTRICAL POWER CO.—Intm. div. of 3% actual, less tax, will be payable on Sept. 19 on ordinary sh. cap. issued prior to 1929 (shs. No. 1 to 1 200 000). No intm. div. will be paid on new ord. sh. cap. issued on April 24, 1929, but this will be adjusted on paymt. of fin. div. for year. A similar mid-term disbursemt. to ord. shhldrs. was made last year.

Company Meetings.

TYNESIDE TRAMWAYS AND TRAMROADS CO.—Mr. G. E. Henderson presiding at the recent half-yearly meeting, said there had been a further reduction in traffic receipts and a further loss on the half-year's working. The deficit for the half-year, after charging interest on mortgages, amounted to £2 062, which had been met by transferring a sum of £2 100 from general reserve. The difficulties with which the company had to contend might be summarised in a few words—heavy cost of track and road maintenance, the approaching necessity of relaying parts of the track, serious 'bus competition, and the obligations on a statutory company to continue its service to the public so long as any funds were available for so doing. The directors took the only course which appeared possible, namely, the promotion of a Bill under which powers were asked to enable the company to abandon its tramway system and substitute omnibuses. It was evident to the directors that continued opposition from the Newcastle Corporation would lead to a heavy increase in the expenditure which would have to be incurred when the Bill came before the House of Commons, so that a renewed attempt was made to find some mutually satisfactory arrangement, and an arrangement had been approved, in principle, by the directors and the Corporation, whereby the present through running agreement with the Newcastle Corporation would be continued, with such modifications as might be necessary to make it apply to 'bus services. The directors felt confident, from reports received from their expert advisers, that the profits from a 'bus service run by the company, with arrangements for carrying passengers through into Newcastle, should be sufficient to pay for any charges on the new capital which will have to be raised, and also go some way towards meeting the company's obligations to the present mortgage debenture holders.

STRATFORD-ON-AVON ELECTRICITY CO., LTD.—At the recent ordinary general meeting Mr. P. M. Rossdale (who presided in the absence of the chairman, Mr. W. G. A. Bond) said the new directors took office at the close of the year under review. The change was consequent upon the acceptance by the majority of the shareholders of the offer to purchase their shares
